During the war, which lasted from 1756 to 1763, the Prussian monarch, with a population of not more than five millions, made head against nearly all Europe and placed Prussia on a foundation of greatness which, with a short interval during the Napoleonic wars, she has since maintained. Regarding the nobles as the principal support of his throne, Frederick set himself to the task of repairing their fortunes, which had been shattered by the war. Ruling with vigor and yet with kindness, he inaugurated and maintained a system of economical administration in the kingdom which soon healed the wounds of strife. His army was kept ever ready for war, for it could hardly be hoped that the rival state of Austria would neglect any opportunity to recover the leading position it had lost to Prussia. In 1764 the Prussian king contracted an alliance with Russia, each power guaranteeing to the other the integrity of its possessions for eight years. During this period Russia showed a disposition to acquire Poland, which unhappy country, rent by civil strife, had fallen into a deplorable state of weakness. On the death of Francis in 1765, the Imperial Crown passed to his son, Joseph II, who had been elected in 1764. In order to prevent the great Northern Empire of the Czar from absorbing the whole Polish kingdom, Frederick joined with Austria and Russia in the first partition of Poland. The Prussian king assented to this iniquitous transaction for the purpose of restraining Russia, and Maria Theresa was forced into it only by the sternest political necessity. By this act Prussia received an addition to her territory of about nine thousand square miles, with a population of six hundred thousand; Austria obtained Galacia and Lodomira, in all about sixty-two thousand square miles, while the remainder, more than eighty-seven thousand square miles, went to Russia. In 1786 the Prelates of Cologne, Treves, Mayence and Salzburg agreed to renounce the supremacy of Rome and form an independent German Catholic Church — so wide had become the gap between the papacy and even the Catholics of Germany. The lower classes of Germany, with the exception of those in the dominions of Maria Theresa, were sinking into a state of servitude but little short of slavery. In her possessions she introduced many reforms which alleviated the misery of the peasants; she also supported schools and churches, and provided educational institutions for the nobles, who were in a lamentable state of ignorance. In 1777–79, and again in 1785, Frederick resisted attempts of Joseph II to possess himself of parts of Bavaria, and prevented him from accomplishing his designs. After the operations of 1785 Frederick observed a growing friendship between Austria and Russia, and, to counteract it, founded the "Confederation of German Princes," which was a combination of the smaller states under the lead of Prussia. Frederick the Great died in 1786, and the Prussian throne fell to his nephew, Frederick William II. Maria Theresa died in 1780, and Joseph II wore the crown of Austria as well as that of the Empire. He had visions of reform which were impracticable. His failures depressed his spirits and an attack of malarial fever carried him to the grave in 1790.

Emperor Joseph II.

Leopold II, brother of Joseph and Grand Duke of Tuscany, came to the throne in a time of gloom for the monarchs of Europe. That wonderful though savage outbreak of the lower classes in France which is styled the "French Revolution," was viewed with alarm throughout Europe as presaging a general downfall of thrones. The "Divine Right" of Kings was indeed questioned outside of France, but the fidelity of the peasantry to their rulers and the hopelessness of a struggle with the disciplined forces of royalty held the mass of the people in check. Frederick William of Prussia hoped to profit by disorders in Austria, but the common danger to European crowns compelled a cessation of his projects and led to a compact in 1791 between the two sovereigns to support the cause of the French king, Louis XVI, against the Revolution.

Leopold died in 1792, and was succeeded by his son Francis I,

of Austria and Francis II of Germany. The National Assembly of France in 1792 demanded that the French emigrants in Germany should immediately disperse or war would be declared. The German emperor naturally refused and war followed at once. The alliance between Austria and Prussia was strengthened by the accession of the other states of the empire. In 1793 occurred the Second Partition of Poland, which was made by Russia and Prussia. The Third Partition, which was made in 1795 between Russia, Austria and Prussia, erased Poland from the map of Europe. On the execution of Louis XVI in 1793, Russia, England and Holland joined the German alliance against France. The French took possession of Holland, and Prussia withdrew from the coalition. The young French general, Napoleon Bonaparte, led an army into Italy in 1796 and fought his way to Klagenfurt in Styria, and in 1797 compelled Austria to make the Peace of Campo Formio.

Frederick William II was succeeded on the Prussian throne in 1797 by Frederick William III, whose reign extended to 1840. In 1799 war was renewed with the French Republic, Austria acting in concert with England and Russia, while Prussia refused to join the coalition, hoping to profit by the disasters of Austria. The Austrians were beaten at Marengo and Hohenlindeu and begged for peace. Napoleon, now First Consul, and soon to be emperor of France, exacted from Germany twenty-four thousand square miles of territory, occupied by three million five hundred thousand people. The boundaries of Germany were established at the Adige in Italy and along the Rhine on the west. Napoleon also formed the states on the eastern bank of the Rhine, which was now under his control, into a territory that he regarded as a barrier against Austria and Prussia. The Peace of Amiens, concluded in 1803 between England and France, secured a cessation of conflict on the Continent, but it was the quiet between the paroxysms of a fever, for the French emperor (elected in 1804) had undoubtedly determined to make himself master of all western and central Europe. In 1804 Francis II recognized Napoleon as Emperor of France; Prussia also acknowledged him, but England, Turkey, Russia and Sweden refused the title recognition. The aggressions of the French emperor brought on a war in 1805 between a coalition composed of nearly all the European powers except Prussia, against the French, who were assisted by Bavaria, Wurtemburg and Baden. Napoleon immediately advanced into Germany and at the battle of Austerlitz, fought December 2, 1805, shattered the Austrian and Russian armies. By the Peace of Presburg, which followed, Germany was humiliated as never before. Venice was ceded to the kingdom of Italy, the Tyrol and Vorarlburg to Bavaria, and other territories to Wurtemburg and Baden. Bavaria and Wurtemburg were erected into kingdoms, the "Confederation of the Rhine" was formed by the French conqueror, and the German Empire was broken up, Francis II abandoning the title of emperor. Up to this time the Prussian king had remained quiet, but seeing in Napoleon's actions a desire to readjust the relations of the whole of Europe, and consequently danger to his own kingdom, made ready for war. Napoleon, who had heard with ill-concealed anger the Prussian boasts of the invincibility of the "Soldiers of Frederick the Great," eagerly embraced the opportunity, and himself at Jena and Marshal Davoust at Auerstadt on the 14th of October, 1806, cut to pieces or captured the larger part of the Prussian army. By the Treaty of Tilsit in 1807, made between the Russian emperor and the Prussian king on one side, and Napoleon on the other, the territories of Prussia were reduced nearly one-half, and its monarch treated with contempt. An attempt by Austria in 1809 to recover her lost position led to the defeat of her army at Wagram, and by the subsequent Peace of Schonbrunn Austria was compelled to relinquish large tracts of her territory. The immense losses of the French in their invasion of Russia in 1812, and the constant waste of Napoleon's resources by the savage war in Spain, so weakened his strength that the Germans entertained hopes of deliverance from the bondage to which he had subjected them. The coalition formed by Austria, Russia and Prussia in 1813–14 beat Napoleon at Leipsic and forced him back to France. At Fontainebleau he abdicated and was sent to Elba. Returning in the spring of 1815, he was definitively overthrown at Waterloo and imprisoned at St. Helena, where he died in 1821. The Congress of Vienna, which began its labors on the first abdication of Napoleon and concluded them after Waterloo, restored with several changes the boundaries of the German states. Prussia received more than half of Saxony, the Rhine province with its old possessions in Westphalia, Posen and other small acquisitions, but lost its Slavonic populations in the east. It was now a strictly German state. To Austria were given the Bavarian and Italian Tyrols, Lombardy and Venice, which states, under the astute management of Metternich, gave the Hapsburg empire a predominating influence in Italy. Bavaria was guaranteed its territory, receiving in exchange for the Tyrol the Grand Duchy of Wurzburg and the Palatinate on the left bank of the Rhine. Hanover was increased by an addition of territory which gave that kingdom control of the mouths of the Elbe, the Ems and the Weser. The kingdom of the Netherlands was enriched by the annexation of Luttich and the Grand Duchy of Luxembourg, Hamburg, Lubeck, Bremen and Frankfurt-on-the-Mainbe came free cities. The new "German Confederation" consisted of thirty-nine states, including the two great monarchies of Austria and Prussia, four Kingdoms, one Electorate, seven Grand Duchies, nine Duchies, ten Principalities and four free Cities. The territories of each state were guaranteed by the others; the citizens of each had certain rights in all, and freedom of religious opinion was established. Disputes between states were to be settled by a diet sitting at Frankfurt, with an Austrian for permanent president. Immediately after Waterloo the Emperors of Russia and Austria and the King of Prussia executed a peculiar compact called the "Holy Alliance," by which they bound themselves as the representatives of the three branches of the Christian church to treat one another as Christian brethren and to govern their people on the basis of Christian principles. The Pope and the Sultan were ignored, but the other monarchs of Europe were invited to join the alliance and did so, with the exception of England, whose Prince Regent could not act without the direction of the Parliament.

As might have been foreseen, the jealousies and divisions of the German states deprived that country for a long time of any weight in European politics, but internal peace was secured and the ravages of the Napoleonic wars were covered over by the industry of the people. The condition of the masses was improved physically, but a new force was moving among them and they were beginning to aspire to something higher than submission to kingly decrees. The French democracy which sprang into action out of its bloody cradle was diffused throughout central Europe by the passage of the French armies, and wherever they penetrated they left with the people an aspiration for freedom. Recognizing this sentiment in their peoples, the rulers of the German states endeavored to retain the old supremacy of the Throne. To them, the political agitation of the years succeeding the Napoleonic wars was but a continuation of the struggle, although the enemy was now their own subjects. In 1816 the Prussian government suppressed a democratic journal which demanded fulfillment of the royal promises to the people, given after the return of Napoleon from Elba. Popular leaders remonstrated against the suppression and demanded constitutional freedom, but the Prussian government refused to fulfill its pledges until compelled by the revolution of 1848. A few states which granted constitutions so restricted them that they were practically inoperative. In Austria, Metternich, the efficient instrument of the Throne, labored to silence every voice raised against absolute monarchy. Repressed at home, German liberalism extended its sympathies to all peoples who strove to throw off the yoke of despotism. The assassination of the dramatic author, Kotzebue, in 1819, on the suspicion that he was a Russian spy, did the cause of freedom much harm, for this act was used as an argument in favor of the repressive measures which the governments of the states at once adopted to crush the popular aspiration for liberty. The Carlsbad Resolutions of 1819, the "Final Act" of 1820, and subsequent measures confirmed the power of the Holy Alliance and made it an engine for the oppression of the people. The French revolution of 1830 found a sonorous echo in the Rhine provinces. In 1832 thirty thousand men gathered at Hambach in the Palatinate to consider means for the emancipation of Germany, but the Bavarian troops put an end to the demonstration. Disturbances in Frankfurt, Brunswick, Cassel and Saxony were quickly put down. Hanover in 1833 granted a liberal constitution to its subjects. Francis of Austria died in 1835 and the crown passed to his son Ferdinand. Liberal government was expected from him, but he adhered to the principle of absolutism. His subjects continued their demands for reform, but obtained nothing. In 1837, on the death of William IV of England, who was also King of Hanover, the latter kingdom was separated from the British crown and given to the Duke of Cumberland, who overthrew the constitution and banished its principal supporters. Prussia was prosperous in her industries and trade. Her schools became models for the other nations of Europe. The old universities were fostered and a new one was founded at Bonn. Religious toleration was the rule; in 1817 an Evangelical union was formed through a reconciliation of the Lutheran and Reformed Churches. Between 1828 and 1834 the German states, with the exception of Austria, united in the "Zollverein" or Customs-Union, with Prussia at its head. Under this union the commerce and trade of Germany were rapidly developed. The steamship and the locomotive were adopted at once by the commercial centers, and the German merchant navy rose to the third rank, standing next to those of the United States and Great Britain.

Frederick William III was succeeded in 1840 by his son, Frederick William IV. This sovereign had a sincere desire for progress, but the revolutionary party in Prussia was not satisfied with the concessions made by him, and the political agitation increased. In self-defence he turned back to his kingly prerogative, and the result was an alienation from him of the affections of his people. The French revolution of 1848 rolled into and over Germany with a force before which the thrones were powerless. In an endeavor to avert the ruin of their states, the various rulers made large concessions to the Liberal party, but without avail. Berlin and Vienna were captured by the popu-

lace, and it seemed as if the bloody scenes of '93 in France were about to be repeated. Hungary and Austrian Italy were aflame with insurrection. Frederick William gave way to the demands of the radical party, and in a proclamation pledged himself to maintain the freedom of the press and also to strive for a union of all Germany in a federal state. A national parliament met at Frankfort, but the delegates split into two factions and did little else than quarrel among themselves. The Republicans were too radical, and the Constitutionalists too conservative, to furnish any hope of united action. The Italian insurrection was put down by Marshal Radetzky, and the revolutionists in Vienna were suppressed with an iron hand by Prince Windischgratz. The Emperor Ferdinand abdicated and was succeeded by his nephew Francis Joseph, then eighteen years of age. By a decree promulgated in 1849, Austria became a constitutional monarchy. General Wrangel quelled the disturbances in Berlin, and a constitution was given to the kingdom of Prussia. The National Parliament elected the Prussian king, Frederick William, Emperor of Germany, but he declined the imperial crown. After changing its place of meeting several times, the National Parliament came to an end at Stuttgart in 1849, having accomplished nothing. In Hungary the insurrection became formidable and assumed the character of a race war. At first the Magyars were successful, and Louis Kossuth was proclaimed President of the Hungarian Republic. The Austrian emperor appealed for aid to the Czar of Russia, who immediately sent a large army into Hungary, and in 1849 the Magyars were overcome. Many of the leaders were exiled and others were put to death by Marshal Haynau, who, by his atrocities, earned the title of the "Hungarian Butcher." Schleswig and Holstein had been annexed to the Danish kingdom, but contained a large German population, who had attempted to set up an independent sovereignty. Their scheme was thwarted by the Danish king in 1846. In 1848 Schleswig and Holstein revolted, and with the assistance of Prussian troops expelled the Danes from the provinces and invaded Jutland. England and Russia threatened to interfere, and the war flagged. Prussia concluded a peace with Denmark, which the people of Holstein rejected and renewed the war. Austria and Prussia ordered that hostilities should cease, and an Austrian army in 1852 disarmed the duchies and surrendered them to Denmark. The question was disposed of for the moment by foreign influence, evidenced by a document called the "London Protocol." Other revolts in north Germany which grew out of the agitation of 1848 were suppressed by Prussian troops.

The prominent part taken by Austria in the Schleswig-Holstein matter added to the bitterness of feeling in Prussia against the former power. After the excitement caused by the outbreaks of 1848 the question of supremacy in Germanic affairs took definite form. Prussia endeavored to form the "League of the Three Kings" — Prussia, Saxony and Hanover — in order to provide a center around which to rally the north German states against Austria. The latter power called on the south German governments to renew the Federal Diet. Austria was joined by Bavaria and Wurtemburg, and also by the northern powers of Saxony and Hanover, and the diet was declared restored in 1851. A trifling conflict of authority between the people of Hesse and their Elector was used as a stepping-stone by Austria, whose troops invaded the principality to sustain its ruler. Prussian troops occupied Cassel, and war between the two principal powers of Germany seemed imminent. An effort was made to enlist the Russian emperor on the side of Prussia, but the czar not only refused to act, but made threatening declarations against the northern German power. Manteuffel, the Prussian minister, met the Austrian minister Schwarzenberg at Olmutz, and in the negotiations Austria was triumphant, but in the end she paid bitterly for her victory. King Frederick William also withdrew his opposition to the Federal Diet. The true sentiments of the Austrian ruler with regard to a liberal government were now displayed. Confident in his strength, the emperor abolished the constitution granted during the insurrections of 1848–9 and restored the power of the Romish church. Austria also directed at Prussia a blow in the form of an attempt to weaken and dissolve the Zollverein, in which the influence of Prussia was predominant. As in Austria, the constitution of Prussia was regarded as a menace to the throne, and although it was not withdrawn, it was so weakened and hampered as to be useless as a measure of reform. Encouraged by the example of Austria and Prussia, the smaller potentates withdrew their concessions to the people and absolutism became the rule of government throughout Germany. None of the states took part in the Crimean war until near its close, when Austria assumed such a threatening attitude toward Russia that the latter was forced into a humiliating peace. The mind of Frederick William IV succumbed and in 1857 his brother, William I, assumed the government as regent, and on the death of the king in 1861 he received the crown. On taking the regency he had declared that "Prussia is ready everywhere to protect the right," and dismissed the Manteuffel ministry. This was a significant act, because it was supposed to refer to the surrender of the Germans in Schleswig-Holstein to Denmark.

Struggle for leadership between Prussia and Austria.

Constitutional government virtually abolished.

William of Prussia.

The Italian war.

In 1859 the position of Austria in German affairs was materially weakened by the outcome of war with Sardinia and France. The Germans generally looked on the Italians as an oppressed people, and to a certain extent their sympathies were with them, but the dominant influence was a fear of the aggrandizement of France. Austria demanded the support of Prussia, which was refused. Later, Prussia took alarm at the prestige and power of Napoleon III and put her army on a war footing, but failed to appear on the field. After William I came to the throne he began to prepare for the inevitable struggle with Austria. Dimly in the future was seen a unified Germany, whose destiny should be controlled by the leading German state. Prussia was determined to occupy this position, while Austria, although relegated to the second place by the conflict in Italy aspired to her old-time leadership. William I met with great opposition in his preparatory measures, seemingly because of his assumption that "The King received his crown from God," and not from the people. Fortunately for Prussia's ascendency, William in 1862 placed at the head of his ministry Count Otto Von Bismarck, then Prussian Ambassador at Paris, one of the most daring and unscrupulous statesmen to be found in history. With a firm belief in the great destiny of a united German people, and devoted to the interests of Prussia, he bent every energy of his powerful mind and iron will to the accomplishment of the task before him. In the direction of German unity he was sure of the support of the German masses, who had seen with pleasure the movement of the people south of the Alps toward Italian unification. With the aspirations of his race to political freedom, Bismarck had no sympathy. Prussia was engaged in a constitutional struggle, and Austria took advantage of the consequent distraction to increase her own influence. On the invitation of Austria, a congress assembled at Frankfort in 1863 and declared that a Parliament should be established, composed of a House of Princes and a House of Delegates, the latter to be selected by the legislative houses of the several states, one-third by the hereditary family of each state, and two-thirds by a popular vote. Control of the whole machine was to be in the hands of Austria. Prussia refused to participate in the congress, and was supported by several of the smaller states. The movement came to naught. With contemptuous audacity, Bismarck advised the Austrian minister Rechberg to transfer the capital of Austria to Hungary, *outside* of Germany.

In 1863 the Schleswig-Holstein question became prominent by the death of Frederick VII of Denmark. The London Protocol provided that he should be succeeded by Prince Christian of Glucksburg as Christian IX. When the incorporation of Schleswig with Denmark was attempted in 1863, that province stood on a different footing from Holstein, which was a member of the German Bund. Holstein was occupied by a force of Saxons and Hanoverians. Prussia and Austria, having both signed the London Protocol, were in an embarrassed position. Prussia protested against the incorporation of Schleswig, and Bismarck declared that the first cannon-shot fired in the attempt to enforce it would destroy the obligation imposed on Prussia by the Protocol. Austria could not afford to sacrifice her influence by abandoning the Germans in Schleswig, and therefore favored the protest of Prussia. England withdrew from the dispute on the ground that, as the Protocol was the joint act of the great powers, none of them could act singly to enforce its provisions. At the same time the English encouraged the Danes to resist. Prussia and Austria sent an army into the disputed country and drove out the Danes, following them to the extremity of Jutland. In 1864 a peace was concluded, by which the King of Denmark ceded all his claims upon Schleswig-Holstein and Lauenburg to the King of Prussia and the Emperor of Austria. Difficulties immediately sprang up between the two great German states over the duchies, which they were supposed to hold in trust. Bismarck in fact declared that Germany held Schleswig-Holstein and Lauenburg for Frederick of Augustenburg, but subsequently he demanded that the troops of the duchies should be incorporated with the Prussian army, that their foreign relations should be under the control of Prussia, and that the fortress of Kiel be given to the same power. Austria expected to establish in the duchies a state which would embarrass Prussia in its plans for supremacy, and supported Frederick in his refusal to accede to the Prussian terms. At a personal interview held between the King and the Emperor at Gastein in 1865, Lauenburg was ceded to Prussia, and a money indemnity therefor paid to Austria, while Schleswig was to be governed by the former power, and Holstein by the latter. Austria encouraged Frederick of Augustenburg in his claims as against Prussia. That power determined to enforce its demands upon the duchies, and to require of several other states that their military organizations be placed under her control. Austria threatened to pass the Schleswig-Holstein controversy over to the Confederation, which could be depended upon to decide against Prussia. Early in 1866 the Austrian government called on all the states under its influence to prepare for war. Bismarck issued a circular letter to the German states setting out that to conserve German interests a reorganization of the Confederation was necessary; that if Prussia's strength were broken, Germany would cease to be a power in Europe. He also

called upon them to state specifically how far Prussia could rely on them for support if attacked by Austria. In addition to this he demanded the assembling of a German parliament. With a hope of rescuing Venetia from Austrian domination, Italy concluded an alliance with Prussia. The Schleswig-Holstein question was passed over to the Confederation by Austria. Bismarck at once declared the Gastein convention broken, and the Prussian troops drove the Austrians out of Holstein. In the meantime the opposition in the Prussian House of Deputies denounced the course of its own government, which continually violated the constitution, but Bismarck, relying on the loyalty of the people, went on with his preparations for war, proposing to strike down Austria with one blow. The Confederation assembled in Vienna, and, on its adoption of a motion inimical to Prussia, the ambassador of that country declared the Bund dissolved because of its unconstitutional proceedings. At the same time he brought forward a new constitution, which the states were asked to accept. The war came on at once. Oldenburg, Brunswick, Coburg-Gotha, Mecklenburg and other northern principalities joined with Prussia, while Austria was allied with Hanover, Saxony, Hesse, Bavaria, Wurtemburg, Darmstadt and Baden. Hanover, Saxony and Hesse-Cassel were at once seized by Prussia. The Prussian forces entered Bohemia and pressed rapidly forward. The Austrian army under Benedek consisted of two hundred and thirty thousand Germans, Hungarians, Slavs and Italians, the latter from the Austrian provinces in Italy, serving unwillingly. The Prussians were superior in numbers, and under the discipline and organization of Von Moltke had reached a high state of efficiency. The two armies met at Königgratz July 3rd, 1866, and when the day closed on the defeated and dispersed army of Austria that power had sunk to a minor place and Prussia occupied the proud position of the leader of Germany. In a frantic attempt to maintain herself, Austria endeavored to secure an alliance with the French emperor, and to set free her own troops in Italy, by the cession of Venetia to Louis Napoleon. This act was viewed throughout the states as decidedly un-German, and alienated all the nationalists from the cause of Austria. Napoleon accepted the cession, but interfered no farther than to offer a peaceable mediation. An armistice was entered into July 22nd at Nikolsburg, which was followed by the Peace of Prague, August 23rd, 1866. Results of the most substantial kind were secured to Prussia by this treaty. Hanover, Schleswig-Holstein, Hesse-Cassel, Nassau and Frankfort were annexed, uniting the hitherto geographically separated sections of Prussia. The voice of discontent in the kingdom was hushed by the decisive victory of Königgratz; the King, Bismarck and Von Moltke became objects almost of worship. The unconstitutional usurpations by the Crown were ratified, and an act of indemnity was passed for all acts and expenditures which had gone beyond legitimate authority. Nor was the effect less in the direction of German unification. Bismarck was as relentless in the prosecution of his project as he had been in his operations for the supremacy of Prussia, which was only a first step. In conformity with a plan brought forward by him in 1867, all the states north of the Main were formed into a Confederation with Prussia at its head. This union was more than a mere confederation. It was a united state, in which Prussia held control of the military forces, foreign affairs, the postoffice and the telegraphs, weights and measures, and coinage; to the smaller states were left their own matters of internal administration. Secret treaties of offensive and defensive alliance were made by Prussia with Wurtemburg, Baden, Bavaria and Hesse-Darmstadt, which effectually separated those states from Austria. That empire with its mixed nationalties was excluded from the German Confederation. The South German states, except Austria, were also bound to the Confederation by the Zollverein, which was firmly established by a customs-parliament of all the states. The wise government of the Confederation by Prussia soon reconciled petty rivalries, and expressions of regret were frequently heard that the line of the river Main had been permitted to shut out the south German states from membership in the new Bund.

Königgratz.

Italy had also profited by the day of Königgratz. The Italian army and navy were both defeated by the Austrians, the first at Custozza and the latter at Lissa, but the Prussian victory caused the annexation of Venetia to Italy, and the long intimacy and conflict between the two countries was signalized by a friendly pact of the German power looking to the formation of an undivided Italian state, occupying the whole peninsula.

Notwithstanding the treaties with the south German states, there was developed in them a dislike of Prussia, founded among the political radicals upon the arbitrary, unconstitutional methods of Bismarck, and among the Catholics upon the fact that the leader in German affairs was a great Protestant state. The socialistic element also began to make head. Centuries of caste had so fixed the social status that an aspirant for higher honors than those which were recognized as legitimate to his class found himself surrounded by an iron wall, to be overleaped only by transcendent genius. Through ages the peasants in the fields had had for ancestors other peasants of the fields, doomed to a life of toil without adequate reward. To them and to the toilers in the workshops the socialistic equality springing from the annihilation of all rank, wealth and position, offered an apparent elysium.

Causes of discontent.

In this situation nothing could more effectually silence internal discontent and forward the cause of unification than a victorious foreign war. The opportunity was soon presented. Louis Napoleon had looked for a long contest between Prussia and Austria, and was both surprised and alarmed by the Prussian victory, which threatened not only to raise up a great German empire, but to destroy the "balance of power" in Europe, to preserve which England and France had taken part in the Crimean war. The events of the Austro-Prussian conflict had followed one another so rapidly, and so uniformly favoring Prussia, that the French emperor had been able to do no more than proffer a peaceable mediation. On the conclusion of the war Napoleon demanded "Compensation for Sadowa" (Königgratz) in the form of a cession to France of the territory on the west bank of of the Rhine. Failing in this, the French emperor exhibited a desire to absorb Belgium, and subsequently proposed to annex Luxembourg and part of Limburg. These last named provinces had been placed by treaty in 1815 and 1839 under the sovereignty of the King of Holland. When the German Confederation was dissolved by the events of 1866, they lost entirely their connection with Germany. This demand of Napoleon, made in 1867, threatened to precipitate a war between north Germany and France, but the danger was tided over, ostensibly by a treaty providing that Luxembourg and Limburg should remain under the control of the King of Holland, with a guarantee of neutrality, but really by the unprepared state of the French army. During the next three years both powers were engaged in strengthening their army organizations and endeavoring to make alliances. The great superiority of the needle-gun, demonstrated in the Austro-Prussian war, was sought to be neutralized by the introduction into the French army of the Chassepot rifle, which was really a much better small-arm than the Prussian weapon. The reorganization of the French army, which was effected by Marshal Neil, was more nominal than real, and the emperor was deceived as to the strength of his forces until the stress of the campaign was felt, when the deception became apparent, but too late to be remedied. The French were as thoroughly deceived by the traditions of the First Empire and the supposed invincibility of the soldiers of France as were the Prussians when they confronted the great Corsican with the boasted soldiers of Frederick the Great. On the German side, Moltke in his cabinet busied himself with the strategy and tactics of the coming war, while Bismarck peremptorily demanded and obtained the necessary legislation. An alleged cause being necessary, it was not difficult to find. In 1870, the Spaniards, who had dethroned Queen Isabella in 1868, offered the crown of Spain to Prince Leopold of Hohenzollern-Sigmaringen, a descendant of a younger branch of the house of which the King of Prussia was a member. Napoleon at once objected, announcing that France would never consent to such an extension of the German power. On the advice of King William, Leopold declined the proffered crown. The French minister then demanded that the Prussian king record a pledge that he would never support the candidacy of a Hohenzollern prince for the Spanish crown, and also that the king write a letter of apology to the French emperor. Both propositions were received with a curt refusal, and the French ambassador at Berlin was dismissed. On the insult to the Prussian king, a great wave of patriotism rolled over Germany and the voice of the nation was raised for war. The dismissal of the French minister was received in France as an attack on the national honor, and the French people became as eager for hostilities as were the Germans. A diet of the north German Confederation met July 19th, 1870, and unanimously placed the military resources of the nation at the disposal of the government. In France orders were issued for the mobilization of the army, and war was declared. Napoleon had received assurances which warranted him in thinking that Austria, Denmark and Italy would join him in the war. It was also supposed that the dislike of Prussian methods among the south German states would secure their aid for the French cause. Revolts were even expected in Saxony, Hesse and Hanover. Napoleon was leaning on a broken reed, for both Italy and Austria maintained a strict neutrality, and all the German states under an irresistible impulse of race pride leagued their forces with the armies of the Confederation. Napoleon knew that his troops were numerically inferior to the united German forces, but hoped to imitate the lightning-like movements of the First Emperor, and dash upon a dispersed German army, giving it no time to concentrate. The conditions, however, were entirely different from those which existed at the time of the great campaigns of 1805, 1806 and 1809. The admirable discipline which then characterized the veteran French army was now found transferred to the German forces, and a silent, stern soldier, without the commanding genius of the great Napoleon, but fully as expert in strategic combinations held the Teutonic troops in leash. The French emperor collected one hundred thousand troops at Strasburg. His main army, which he proposed to command in person, was assembled, one hundred and fifty thousand strong, at Metz. A reserve of fifty thousand men garrisoned the fortified camp at Chalons. A junction was to be effected between the army at Strasburg and the one at Metz, the two to cross the Rhine together.

Threatened war with France.

The German plan contemplated an invasion of south Germany by the French, which would be neutralized by the assembling of the German army in the Palatinate on the French flank. In the first days of August four hundred and fifty thousand Germans were concentrated between Treves and Landau, while one hundred thousand more were on the march to the front. The French Emperor advanced first, moving upon Saarbrucken on the 2nd of August and driving out a small German detachment which occupied the town. This affair was proclaimed in France as a great victory. On August 4th, the Crown Prince of Prussia moved across the frontier, attacking a French division at Weissenburg. The French fought heroically, but were forced to retire with heavy loss. Marshal MacMahon, in command of this division of the French army, hastily withdrew to Woerth, but before he could collect his forces, a part of whom were coming up from the rear, the Crown Prince attacked him, on the 6th of August, and after a severe contest, in which the French Turcos and Zouaves distinguished themselves, drove MacMahon from the field into the passes of the Vosges Mountains. Part of the discomfited French army fled to the south and took refuge in Strasburg. On the same day a Prussian force assaulted General Frossard, who had taken position on the Spicheren Heights near Saarbrucken, and at the close of the fight Frossard retired to Forbach, beyond the frontier of Lorraine. By these operations MacMahon was cut off from a junction with the main French army at Metz. By a circuitous march he reached Chalons. So far the whole French plan of campaign, which contemplated an immediate advance on Berlin, was defeated, but the reverses already sustained were not yet beyond remedy, for the finest part of the French army had not been engaged, and in the defensive campaign forced upon them, advantages of position might be made to compensate for inferiority in numbers.

Retreat of the French.

A rapid concentration of the imperial armies was attempted by a backward movement to the Moselle. The three German armies advanced into France at once. The passes of the Vosges were forced and the retreating French under MacMahon were pursued by a division while the remainder of the Germans moved toward Metz. Abandoning everything to the castward except Metz and Strasburg, the French army under Bazaine endeavored to concentrate near Chalons, with the design of ultimately falling back on Paris. Passing through Metz, Bazaine reached the left bank of the Moselle, but at Courcelles his rear-guard was overtaken and compelled to fight. In this battle the French Third and Fourth corps were beaten and driven under the walls of Metz. Bazaine moved out toward Verdun. Arriving at Vionville on the 16th, he was attacked in flank, and as the successive divisions of the two armies came up a desperate battle was fought, which resulted in such an obstruction of the road toward Verdun that Bazaine gave up his attempt. He held his position with the intention of continuing the battle, but his danger was extreme, because of the heavy reinforcements which the enemy were receiving. On the 17th two hundred thousand Germans were concentrated before Gravelotte, commanded by the king in person. The French force was decidedly inferior in numbers. In the maneuvers which preceded the battle the positions of the two armies were so changed that the German line faced the east, and the French stood with their backs toward Germany. The latter, intending to fight a defensive battle, strengthened their line and took all possible advantage of the heights and the numerous ravines with which the position was intersected. The Germans attacked at nine o'clock in the morning of the 18th. The fighting was desperate, and the assailants were unable to force the position until, toward evening, a flank attack by their Twelfth corps compelled the French to give way. During the night Bazaine withdrew into Metz. The French loss was about twelve thousand, and that of the Germans twenty thousand, but the disparity in losses was more than compensated for by the shutting up of the French army in Metz. Masking that fortress with a force of one hundred and sixty thousand men under Prince Frederick Charles, the German army moved toward Chalons. In the meantime the French in Paris had turned against their Emperor, deposing him, and declaring for a Republic. A plan was devised by General Palikao which required the French at Chalons, under Napoleon and MacMahon, to move along the Belgian frontier in order to effect a junction with the army of Bazaine at Metz. The Germans, receiving information of the movement, marched across the country to intercept it. The French were moving on an arc of a circle, while the Germans marched on a chord of the same arc. The German advance encountered the French on the 29th of August at Nouart. On the 30th a part of the French army was beaten in the battle of Beaumont, and by the 31st their whole force was hemmed in by the Germans. Under these circumstances the battle of Sedan was fought on the 1st of September. After a day of fighting, the French were driven into Sedan, where they were subjected to a murderous fire from the German artillery. Reduced to despair, Napoleon surrendered. Paris having declared against him, he was compelled to throw himself on the generosity of the Germans, who assigned him as a residence the castle of Wilhelmshohe in Cassel. MacMahon was severely wounded during the combat. The surrendered army numbered between eighty and ninety thousand men, with three hundred and thirty pieces of artillery. At Metz, Bazaine made several unsuccessful sorties, and was forced by lack of supplies to surrender the fortress on the 27th of October, with about one hundred and eighty thousand men. Meanwhile Strasburg had been besieged, and held out under General Uhrich until September 28th, when the city was surrendered with eighteen thousand troops.

Battle of Vionville.

Battle of Gravelotte.

After the capitulation of Metz the German army advanced on Paris and besieged it. Upon the deposition of Napoleon, the city had been placed under a provisional government and General Trochu entrusted with the defense. Paris was defended by about three hundred thousand men, including the troops of the line, the marines and the national guard. The German force was numerically inferior, but the disparity in numbers was more than made up by the indecision of Trochu's character and the superior organization and discipline of the besieging army. The marines, who manned the forts, and the troops of the line as well as the mobiles from the provinces who fought outside the walls of the city, sustained the old-time reputation of the French as a martial race, but the national guard of Paris did little more than consume provisions and indulge in mock heroics. The German lines of investment were drawn about the city in the fall and early winter, and the siege resolved itself into a starving-out operation with occasional sorties by the beleaguered French. While the siege was in progress several armies were raised in the provinces and advanced to the relief of the capital. One of these exterior forces, commanded by Garibaldi, carried on a partisan warfare in the southeast of France, but was defeated by Gen. Werder at Pasque, near Dijon, in the latter part of November. A German division under Gen. Von der Tann advanced to Orleans, where it was attacked by an improvised French army and driven back. Reinforced by the troops under Prince Frederick Charles, who took command of the whole German strength in this part of France, the invaders moved on Orleans and drove across the Loire the army of Aurelles de Paladine. The hastily raised French Army of the North, commanded by Gen. Bourbaki, was confronted by Gen. Manteuffel at Amiens and forced back to Arras. Manteuffel then occupied Rouen and stretched his lines across the country to protect the besiegers of Paris from attack on the north and west. Late in November a sortie was made by the French from Paris in a southeasterly direction for the purpose of effecting a junction with the Army of the Loire. Moving toward Paris, the Loire Army was checked by Frederick Charles at Beaune la Rolande. The sortie from the capital, which was led by Gen. Ducrot, was unsuccessful, the French being thrown back into the city after a fierce struggle in which both armies sustained heavy losses. The German force at Orleans pushed out southward in the first days of December. A detachment of the French was driven through Tours to Gien, where it was dispersed. The main body of the Army of the Loire, under Gen. Chanzy, who had succeeded Paladine, met the enemy at Beaugency, and, after several days of skirmishing and fighting, was defeated and pushed back to Le Mans. On December 18th Gen. Werder engaged a French division at Nuits in the eastern department, but fell back to Vesoul on the reception of a report that he was about to be attacked by a large force under Garibaldi and Bourbaki.

About the middle of December the French Army of the North, now under General Faidherbe, advanced upon Amiens in concert with a projected sortie from Paris. Manteuffel attacked the northern army, and after a well-fought battle the French retreated to Arras. From Paris the French moved out to the northeast and reached the village of Le Bourget; here their advance was stayed, and they were soon pressed back into the city. Provisions in the besieged capital were nearly exhausted, and the troops and inhabitants were fed on a reduced ration. Horses were slaughtered and eaten, and the fine collection of rare animals in the Jardin des Plantes was converted into food. There was as yet no actual starvation, but the pinchings of hunger began to be felt. Notwithstanding this, the citizens and soldiers unitedly cried out against surrender. The organized French forces outside of Paris were included in Faidherbe's army of sixty thousand at Arras, the force under Gen. Chanzy, one hundred and fifty thousand strong, near Le Mans, and about twenty thousand under Garibaldi and Crémer in the eastern districts. In addition to these, numerous bands of Franc-tireurs carried on a sort of guerrilla warfare in the rear of the German armies. In the beginning of January, 1871, Frederick Charles moved against Chanzy, who was himself on the march to attack the Germans. The French fell back fighting to Le Mans, where, in a decisive battle, the Germans beat and dispersed their opponents. Bourbaki, with the Army of the East, numbering about one hundred and fifty thousand undisciplined and ill supplied men, undertook to cut the enemy's line of communication with Germany, designing ultimately to invade that country. General Werder occupied a position near Montbéliard, where the French attacked him, but were compelled to retreat after an indecisive action. Bourbaki was pursued to Pontarlier, near the Swiss line, and was there attacked by Manteuffel on the first of February. Several thousand of the French were captured and the remainder escaped into Switzerland, in which neutral territory they were disarmed. Faidherbe, with his little Army of the North, advanced resolutely to St. Quentin, where, in a battle with a

superior force on the 19th of January, he was decisively defeated. In the meantime the fortresses of Thionville, Montmedy and Mézières, with others, fell into the hands of the Germans, to whom scarcely any organized resistance was opposed except at the capital. The bombardment of Paris began January 5th. Trochu conducted a last desperate sortie toward St. Cloud on the 19th of the same month, but made no permanent impression on the German lines. Food supplies were now so reduced, and the impossibility of relief from the outside was so evident, that the capitulation of Paris was seen to be unavoidable. That city surrendered January 28th, 1871, and during an armistice of twenty-one days a National Assembly met at Bordeaux and agreed to the German terms. A treaty of peace was negotiated at Frankfort on the 10th of May, by which France ceded to the victors the German part of Lorraine, including the fortress of Metz, and all of Alsace except Belfort. The French also agreed to pay to Germany five thousand millions of francs as a war indemnity. As security for the payment of the indemnity, the Germans were to occupy with their troops the forts north and east of Paris and the northeastern departments of the country. In the war the Germans captured nearly four hundred thousand men and more than seven thousand cannon. While the Siege of Paris was in progress a proposition to reconstitute the German Empire as a Confederation by a union of all the states except Austria, with the King of Prussia as Emperor, was accepted generally throughout the nation. On the 3rd of December, 1870, Prince Leopold of Bavaria, in the name of the German governments, tendered the Imperial Crown to the Prussian monarch. The necessary legislation was had in the various states, and at Versailles, on the 18th of January, 1871, King William of Prussia was proclaimed Emperor of Germany. The German army made a triumphal entry into Paris on the 1st of March, and retired after occupying the city thirty-six hours. On the 7th of March the German headquarters were removed from Versailles, and the Emperor set out on his return home, whither his chancellor had preceded him. He passed over the memorable fields of Vionville and Gravelotte on his way, and it was not until the 17th of March that he arrived in Berlin. That was a day long to be remembered in the Prussian capital. The venerable Marshal Wrangel, Bismarck, Moltke, Roon, Steinmetz and Falckenstein were on the platform to meet him, and the greetings which the veteran Emperor received from these tried and trusted servants, from the members of his own household, and from the people were full of affection and patriotic enthusiasm. On the 19th, a solemn thanksgiving service was held at the cathedral. On the 22nd, the Emperor's seventy-fifth birthday was celebrated, the festivities being attended by most of the German princes in person, while Austria, Spain and Italy sent congratulations. The Emperor took occasion to reward his officers who had so well stood by him in the past troubles; Bismarck was created a prince, and General Moltke was raised to the peerage with the title of Count. On the 16th of June a grand military display was held in honor of the success of the war, when 50,000 troops who had borne a part in it entered Berlin in triumph and were reviewed by the Emperor, who had stationed himself under the statue of Blucher. After the review, William unveiled a statue of his father, Frederick William III, and at night the city was illuminated — the only dark spot being the building occupied by the French embassy.

Peace being assured abroad, the Emperor and his chancellor set about consolidating the institutions of the new empire. They soon found that they had two antagonistic parties above all to deal with — the Ultramontane Catholics on one hand and the Socialists on the other — and for the next ten years the history of the empire is mainly concerned with the struggle between these two parties and the Imperial Government. Trouble came almost immediately from the Ultramontanes, spurred on by the Vatican, which viewed the rise of a powerful Protestant German empire with dismay. The first united German parliament met on the 21st of March, 1872, and a passage in the Emperor's opening speech, in which he said that Germany would leave to every nation to find its way to unity, and to every state to determine the form of its own constitution, was interpreted by the Catholics as an intimation that the Imperial Government would not interfere in behalf of the Pope's temporal sovereignty. They moved an amendment to the Address to the Throne, but Bismarck's influence was too powerful for them. They were defeated by 243 votes to 63, a few Socialists voting with the minority. Shortly after this, a manifesto was addressed to the Emperor by the Archbishop of Cologne and twelve other prelates, complaining of the course of the Minister of Public Worship in retaining in office a religious teacher who adhered to the Old Catholic doctrines. The Old Catholics were a party who opposed the new dogma of papal infallibility, which the Vatican Council had proclaimed during the Franco-Prussian war. The Emperor replied that whether his hopes of harmonious co-operation in promoting the new empire were fulfilled or not, he would continue as before to grant to each community the fullest liberty consistent with the rights of others, and their equality before the law. The religious freedom thus accorded to the Old Catholics was very distasteful to the Ultramontane bishops. A further blow to their intolerance was dealt by the Bavarian minister, Von Lutz, who introduced in the diet a bill making it penal for clergymen to abuse their office by political agitation in the pulpit. In the Rhenish provinces, the Roman Catholic priesthood had been in the habit, during elections, of delivering sermons describing in pathetic terms the situation of the Pope, and urging their hearers to elect Ultramontane candidates. The bill was carried by a large majority.

In 1872 the conflict with the Romish party deepened in intensity. Both sides were in an uncompromising temper; and Bismarck was determined that the state should not yield. "We will not go to Canossa," he said. He resolved to settle once for all the old quarrel between Pope and Emperor, and to crush the priest under the supremacy of the sovereign. William was convinced that the Catholic clergy were wanting in loyalty, and adopted entirely the views of his ministry. He placed at the head of the Department of Public Worship Dr. Falck, a Protestant advocate, who was thoroughly in sympathy with the policy of the government, and under Falck's administration a system of legislation was inaugurated for the purpose of placing the Romish church in Germany and all its institutions, clerical, monastic and educational, under the control of the state. It was a struggle, the Berlin cabinet declared, for the well-being of civilization, of which the Church of Rome had become the declared enemy; it was a "kulturkampf" — a battle for culture — as an eminent Deputy of the advanced Liberal party termed it. The collision between the State and the Romish church was precipitated by an occurrence purely accidental. Bismarck happened to enter the House of Deputies one day when Dr. Windthorst, the leader of the Catholic reactionary party, was making a speech, in which he complained of the diminished advantages open to Catholics in the state and in education. The chancellor delivered an impromptu reply, severely arraigning the clerical party for their disloyal attitude. "When I returned from France to devote myself to home affairs," he said, "the Clerical, or Centre party, which had just been formed, seemed to me a party whose policy was directed against the predominance and unity of the state. I will not conceal from you that the government had hoped to rely upon the assistance of the orthodox element. I thought it had a right to expect that they, above all, would render unto Cæsar the things that are Cæsar's. Instead of this we find ourselves systematically withstood in the South, and most violently attacked in the papers and in speeches destined for the instruction of the lower classes." The first fruit of this debate was the introduction of a School Inspection bill, providing that the state should have the supervision of all educational institutions, public and private; and that all officers appointed as inspectors should be servants of the state, and in no way responsible to the various religious denominations. The Catholics, of course, opposed the bill strenuously, but, oddly enough, the orthodox Protestants united with the Ultramontanes, while the Poles were against it because they looked upon it as a step toward Germanizing the Polish provinces. The Liberals, however, of all shades of opinion, supported the chancellor. In the royal circle, the only friend of the measure was the Crown Prince, both the Emperor and Empress being very lukewarm, but inclined to favor the old denominational system. Bismarck's vigorous pleading carried the bill by a majority of 197 to 171. The bill then went to the Upper House. An unforeseen circumstance strengthened its chances there. A Polish youth was arrested on a charge of conspiring to assassinate Prince Bismarck, and his examination revealed the fact that he had been living in the house of a Jesuit priest, where the police seized some important papers. When the School Inspection bill came before the Upper House, Bismarck read aloud several passages from the confiscated correspondence which were very damaging both to Dr. Windthorst and to the Bishop of Mayence, in regard to Ultramontane intrigues. He charged that the aims of the Clerical party were incompatible with the interests and policy of the new empire, and read a dispatch from one of his diplomatic representatives to the effect that France hoped to gain revenge by stirring up religious trouble in Germany, and that the Pope sought to overthrow the empire so that he might re-establish his secular power in Italy. He concluded with a powerful appeal to the Conservative opposition. "While two Catholic powers existed on our borders," he said, "each supposed to be stronger than Prussia, and more or less at the disposal of the Catholic church, we were allowed to live in peace and quiet. Things changed after our victory of 1866, and the consequent ascendency of the Protestant dynasty of Hohenzollern. And now that another Catholic power has gone the same way, and we have acquired a might which with God's help we mean to keep, our opponents are more embittered than ever, and make us the butt of their constant attacks." The chancellor was again victorious. The bill passed the Upper House by 125 votes to 56.

Bismarck and the papacy.

Soon afterward there was an open quarrel between Germany and the papacy, owing to the Pope's refusal to receive Cardinal Prince Hohenlohe as the German representative at the Vatican. The Prince was "*non grata*" because he was not only a Liberal German unionist, but an opponent of the infallibility dogma as well. The matter was discussed in the Reichstag on the 14th of May, when Bismarck, after expressing regret at the discourtesy of the Pope, said that regard for the interests of the Catholic population of Germany alone determined him to nominate another envoy. A majority of the Deputies were for striking out of the estimates the cost of an envoy to the Vatican, but Bismarck again prevailed, and the charge was sanctioned.

The Jesuits curbed.

On the 15th of May, petitions for the expulsion of the Jesuits were presented by the hundred, and it was shown that while in 1864 that order had only 69 convents in Germany, they had increased to 243 in 1865, to 481 in 1866, and in 1869 to 826. In accordance with a resolution of the House, the government introduced a bill placing the Society of Jesus under police supervision, giving the Federal Council power to remove its members from any part of Germany where their presence seemed inconsistent with the public interests, abolishing all Jesuit convents, and expelling all foreign members of the order from German soil. The bill was passed, and received the Emperor's sanction. Among those who advocated it was Prince Hohenlohe, the late Bavarian premier. The suppression of the Jesuits threw the Roman Catholic church into a militant attitude. A union of German Catholics was organized at Mayence with the avowed object of supporting that church in its conflict with the empire. The members of the union met at Fulda in September, and issued a memorial explicitly asserting that the canon laws were more binding than those enacted by the secular power, and that the church and not the state was supreme in ecclesiastical matters, in education, and in marriage contracts. They also upheld the Episcopal right of excommunication. The Pope's Christmas allocution contained a reference to the situation of affairs in Germany, which added fuel to the flame on both sides.

The response of the Imperial Government to the Fulda manifesto and the Pope's allocution was the introduction on the 9th of January, 1873, of the celebrated Falck laws, called also the "May laws," from the month in which they were passed. The Prussian Minister for Public Worship, Dr. Falck, brought in four important bills, by which the state proposed to take into its own hands the supervision of the education of the clergy, and to ensure the training of a German national instead of an Ultramontane clergy. Hitherto all churches had been left free to govern themselves and to educate their own clergy, and in the case of the Roman Catholics special seminaries had been established for the education of those destined for the priesthood from their youth upward. All institutions of the kind now in existence were by the proposed law to be placed under rigorous state inspection, while the opening of new ones was forbidden. Candidates for the priesthood were required to attend the State Gymnasia and Universities, so that a portion at least of their training might be received among the laity, and before they could be ordained they must pass a state examination. The government was henceforth to exercise supervision over all clerical appointments, and heavy fines were imposed for violations of this law.

A supreme court was to sit at Berlin to deal with cases involving ecclesiastical discipline. These bills were discussed at great length and with much fervor, but ultimately all of them were passed by both Houses of the Prussian Parliament. The German Diet opened on the 12th of March. In consequence of a report prepared by the committe on religious orders, the Federal Council decided to expel from the empire the monastic orders of Redemptorists and Lazarists, and the congregations of the Holy Cross and the Sacred Heart. This decision gave rise to a warm debate in the diet, when Bismarck again denounced the Ultramontane leaders as enemies of the empire, and appealed to the judgment of history against them. The Prussian Catholic bishops met at Fulda in April, and drew up a solemn protest against the ecclesiastical laws, which was circulated amongst the clergy in their dioceses. Active resistance to the law began to be offered, and prosecutions were promptly instituted, the most notorious of those against whom criminal proceedings were taken being Ledochowski, Archbishop of Posen, who had systematically made appointments to benefices in defiance of the laws. He was condemned to a fine of 200 thalers, or four months' imprisonment, but he still kept on the same course. The conflict between the government and the Ultramontanes continued all through the year. In October, a great sensation was caused in Germany and throughout Europe by the publication of a correspondence between the Pope and Emperor William. Writing on the 7th of August, the Pope charged the German government with aiming more and more at the destruction of Catholicism, but said he had heard that the Emperor did not approve of the harshness of the measures adopted by the government, and that those measures could have no other effect than to undermine his Majesty's own throne. "I speak with frankness," Pio Nono added, "for my banner is truth. I speak in order to fulfil one of my duties, which consists in telling the truth to all, even to those who are not Catholics, for every one who has been baptized, belongs in some way or other — which to define more precisely would be here out of place — belongs, I say to the Pope." On the 3rd of September the Emperor replied saying that he was glad his Holiness had done him the honor to write to him, because it afforded him an opportunity to correct errors which must have occurred in the communications his Holiness had received relative to German affairs. "If the reports which are made to your Holiness respecting German questions only stated the truth," wrote William, "it would not be possible for your Holiness to entertain the supposition that my government enters upon a path which I do not approve. According to the constitution of my states, such a case cannot happen, since the laws and government measures in Prussia require my consent as sovereign. To my deep sorrow, a portion of my Catholic subjects have organized for the past two years a political party which endeavors to disturb, by intrigues hostile to the state, the religious peace which has existed in Prussia for centuries. Leading Catholic priests have unfortunately not only approved this movement, but joined in it to the extent of open revolt against existing laws." The Emperor expressed a hope that his Holiness would, upon being informed of the true position of affairs, use his authority to put an end to the agitation carried on amid deplorable distortion of the truth and abuse of priestly authority. He could not pass without contradiction the expression that every one who has received baptism belongs to the Pope. He accepted no other mediator with God than Jesus Christ. "This difference of belief," he concluded, "does not prevent me from living in peace with those who do not share mine, and I offer your Holiness the expression of my personal devotion and esteem." It was generally conceded that William had the best of the argument, and congratulations poured in upon him from all parts of Germany. The city of Augsburg in particular sent a remarkable address signed by Catholics and Protestants alike, expressing satisfaction and pride at the independent attitude of the Emperor, declaring the papal complaints of persecution to be a wanton perversion of the truth, and urging his Majesty to continue to enforce the laws. As the Emperor's letter came opportunely just before the elections to the Prussian and Imperial Diets, it had the effect of gaining many votes in favor of the policy of William and his premier. In the session now inaugurated another important bill was passed, sanctioning civil marriage and civil registration of births and deaths throughout the Prussian dominions. The functions of the registrar were made obligatory, while those of the clergy were left optional. On the 7th of December, William, as King of Prussia, issued a decree requiring all Catholic bishops, previous to receiving recognition from the state, to take an oath to observe the laws of the Prussian kingdom, and not to allow the clergy subject to them to teach resistance. They had hitherto sworn only to obey the laws, but reserved to themselves all rights with regard to their spiritual obligations. Pius IX grew more and more morose over the state of things in Germany, and in an encyclical described the Old Catholics as "wretched sons of perdition," and excommunicated their newly appointed leader, Bishop Rheinkens.

The year 1874 was marked by continual friction between Bismarck and the Catholic party. Although both the Ultramontanes and Social Democrats opposed his repressive ecclesiastical policy, it was supported as a necessity by nearly all the influential and liberal classes of Germany. Bismarck had said, "We will not go to Canossa." He now considered it necessary to supplement the Falck laws by three additional bills. The first simply explained certain terms which had been obscurely worded in the first laws, and had received conflicting interpretations in the law courts. The second and third provided for the administration of dioceses which might be deprived of their bishops. Before many weeks had elapsed, four out of the twelve Roman Catholic bishops of the Prussian kingdom came to a rupture with the government. Three of these, Archbishop Ledochowski, the Archbishop of Cologne, and the bishop of Treves, were arrested and imprisoned for refusing to pay the fines imposed upon them for their persistent violation of the Falck laws. A bill was passed during the spring session of the Reichstag to prevent the re-assertion of their claims by offenders whose terms of imprisonment should expire. Such persons could be ordered by the administrative authorities of their several states to leave, or take up their residence in districts assigned to them. Should an offender still decline to conform to the law, the government of his state was authorized to strip him of his citizenship, and to expel him from the territory of the German Empire. The Imperial Diet passed this measure by the enormous majority of 257 to 95. The supplementary Falck laws were likewise confirmed, and it was decreed that under certain conditions Roman Catholic congregations should be permitted to choose their own priests, and have a hand in the management of church property. Prince Bismarck went to drink the waters at Kissengen in July, and while there a journeyman cooper named Kullmann, imbued with hatred of the ecclesiastical laws, fired a pistol at him. The Prince escaped unhurt, and his would-be assassin was arrested, tried, and sentenced to seven years' penal servitude. In 1877 a colossal statue of Bismarck was unveiled at Kissengen near the spot where this attempt upon his life was made. Throughout the year 1874, Bismarck's anti-Romish policy was pursued with vigor. Numerous arrests of recalcitrant priests were made, and diplomatic relations with the Vatican were entirely broken off. This led to another vehement debate, in which Dr. Windthorst attacked the foreign policy of Bismarck. In the course of his reply the chancellor said, "I know from the very best sources that Napoleon was dragged into the war very much against his will by the Jesuitical influences rampant at his court; that at the eleventh hour he determined to maintain peace; that he stuck to this determination for half an hour; and that he was ultimately overpowered by persons representing Rome." This speech made a deeper and more lasting impression than any yet delivered by Bismarck since the commencement of the conflict with the church. One of the first acts of the German Diet in 1875 was to pass a comprehensive measure extending the civil registration of births, deaths, and marriages over the whole em-

pire, abolishing clerical jurisdiction in suits for divorce, and allowing Catholic priests, monks and nuns to marry. The Pope issued an encyclical declaring the Falck laws to be invalid and contrary to the divine institution of the church. Bismarck replied by giving the Ultramontanes another stringent Falck measure. In March a bill was passed by the Prussian Diet withdrawing the state grants from Roman Catholic bishops. Another bill was passed excluding all religious orders and societies of the Catholic church from Prussian territory. The elections to the German Reichstag of 1877 were less favorable than formerly to the government. The Ultramontanes lost considerably, but there was a great Conservative reaction as well as a notable increase in the socialist vote. Bismarck was not slow to perceive that with the complete triumph of his ecclesiastical policy the tide of feeling against the Catholics had about reached its culminating point, and began quietly to shape his course towards reconciliation with the Vatican; but it was not until after the accession of Pope Leo XIII in 1878 that a *modus vivendi* between the Romish church and the German government was finally established.

Next to the Ultramontanes, the most formidable opponents of the imperial government were the socialists, who had been secretly organizing and growing in numbers since 1862, when Ferdinand La Salle began his agitation by addressing audiences of working men in Berlin and Leipsic. La Salle was a gentlemen of fortune and a philanthropist, and his views were moderate from the socialistic standpoint. He thought the method by which workingmen might rise above their condition was by forming protective associations with the aid of the state. Those who championed the cause after his death were extremists who aimed at nothing short of communism, and did not hesitate to advocate revolution if necessary to bring about their Utopia. After the close of the war with France, this party began to figure more and more largely at the annual elections, until in 1877 it was estimated that they could control one-tenth at least of the voting power of the state. They thought the time had come for them to show their hand openly as early as 1871, when Herr Bebel gave utterance to their views in the Prussian Parliament. After remarking that what the Communists had done in Paris was but an outpost skirmish, which would be followed up some day by a great European battle, he exclaimed, "War to the palaces, peace to the cottages, and death to luxurious idleness, is and ever will be the watchword of the proletariat in all parts of the world." Several strikes of workmen, notably in Berlin, occurred in the fall, and before the year closed a meeting of working men was convened in the capital by the Social Democratic Union. Its objects were to protest against the petty remuneration given to the landwehr and reserves as compared with the munificent grants made to the generals and other officers, and to adopt some plan for greater industrial cooperation among the Berlin working men. As a counterbalancing movement, when the manufacturers assembled for their annual meeting at Leipsic, they took into consideration the interests of the capitalists, and sought to contrive measures for overcoming the hostility of the workmen. Notwithstanding the complaints of the socialists, the commercial condition of the empire was very prosperous. The war had not appreciably interfered with business, and the taxes yielded as much in 1870 and 1871 as in the preceding years of peace. The commerce of the country was sound at heart, and after the conclusion of peace with France the commercial prosperity of the German empire advanced by leaps and bounds, money being so plentiful that means could scarcely be found to employ it. Seven years of tranquillity and prosperity passed, and while Bismarck's hands were full with the Catholic troubles, the socialists made no overt demonstration of opposition to his government. But in 1878 the whole civilized world was shocked by an attempt, as cruel as it was foolish, to take the life of the aged Emperor while he was driving in the avenue called Unter den Linden with his daughter, the Grand Duchess of Baden. A mechanic named Hœdel came behind the carriage and fired twice at William, missing both times. "Is it possible these shots are intended for me?" was the comment of the astonished Emperor. Hœdel was tried and executed. All Europe joined in expressing detestation of the crime, and among the most gratifying messages of congratulation received by William was one from Marshal MacMahon, President of the French Republic. In consequence of Hœdel's attempt, the government introduced in the Reichstag an anti-socialist bill of a very stringent character. It was earnestly opposed by Bismarck's own friends, the National Liberals, Herr von Bennigsen and Dr. Lasker making speeches against it. The government was badly defeated, chiefly by liberal votes, and withdrew the bill. But on the 2nd of June a far more serious attack than Hœdel's was made upon the Emperor. As he was passing through Unter der Linden on foot, two shots were fired at him from the second floor of a house by Dr. Nobiling, who was immediately arrested. He fired repeatedly upon those who forced their way into his apartment, and then turned his pistol on himself, inflicting wounds upon his head before he was overpowered, of which he soon died.

The Emperor was taken in a carriage to the palace, where thirty small shot were extracted from his arms, neck, and shoulders, when the operation had to be suspended because of the inflammation of the wounds. "It is well thou wast not with me this time," said William to his beloved daughter. He was incapacitated for public business for six months, during which time the Crown Prince Frederick acted as regent. For some time a fatal issue was dreaded. These crimes made a deep impression upon Prince Bismarck. The American general Grant, who was then making a tour of Europe, was in Berlin at the time of Nobiling's attempt, and had a conversation with the Prince on that subject. The American general having expressed the horror with which he and all his countrymen regarded the act, Bismarck gave free vent to his feelings. "We see an attack made on the life of an old man," he said, "one of the best men in the world. There never was a man with a more modest, generous, humane character than the Emperor. He is quite distinguished from those born in so high a position, or at least from most of them. You know that people of his rank, born in the purple, come to believe themselves different from their fellowcreatures. They attach little importance to the feelings and wishes of others. Their whole education tends to suppress human sympathy. The Emperor, on the contrary, is sympathetic and humane in everything. He has never in his life injured anyone, or treated him with harshness. He is one of those whose kind nature wins the hearts of all. He is always occupied with the happiness and welfare of his subjects and his entourage. It is not possible to conceive a type of gentleman more noble, amiable and generous. He is adorned with all the lofty qualities of a Prince, and all the virtues of a man. I thought that the Emperor could pass through his empire alone and unattended without the slightest danger, and yet we see that people have attempted to murder him. Our Emperor is in all things so republican that even the most bitter republican would admire him if his judgments were impartial." The Parliament would doubtless now have reconsidered their action, and passed the bill for the suppression of socialistic meetings and publications, but Bismarck would not give them the chance. On the 11th of June an imperial ordinance pronounced the dissolution of Parliament in consequence of the rejection of the law. At the elections which followed, the socialists returned fewer members, though they polled a larger number of votes, only 9 instead of 12 being elected. The conservatives largely increased their strength, while the liberals were greatly weakened. The Emperor's speech, which was read by deputy at the opening of the German Diet on the 9th of September, dealt chiefly with the attempts made upon his life and the anti-socialist bill to be laid before the house. A hope was confidently expressed that the deputies would not refuse to grant the means of giving the peaceful development of the empire the same security against attacks from within as it had enjoyed against those from without, and that the spread of the socialist movement would be arrested. When the bill was introduced, Count Stolberg, as spokesman for the government, admitted that the measure was one of great severity, but insisted that halfway measures would only do harm. The Ultramontane party opposed the bill, and recommended its reference to a select committee. Herr Bebel denied that there was any connection between the Social democracy and the crimes of Hœdel and Nobiling. Prince Bismarck was reproached for having formerly courted the socialists whom he now sought to repress. In his vindication, the chancellor admitted that he had been on intimate terms with La Salle, but maintained that, so far from being an extreme revolutionist, that prominent socialist was deeply imbued with national and even with monarchical principles. The bill was ultimately referred to a committee of 21 members, was reported back, and finally passed the Reichstag by 221 votes to 149. By this bill it was left to the authorities to decide what socialist and communist doctrines were, and to take peremptory measures for the suppression of socialist writers and agitators. It came into force immediately, and four clubs in Berlin and a large number of publications were at once suppressed by the police. It was as promptly and rigorously enforced throughout the country, and, at the close of the year, 171 associations and 45 newspapers had been suppressed, and 150 books and pamphlets prohibited. In the following year 457 injunctions were issued under the anti-socialist law, 189 being directed against clubs and societies, 58 against periodical publications, and 210 against books and pamphlets. This repressive law was not the only result of the attempts to accomplish socialistic ends by murder. The government undertook a vast legislative labor, embracing the whole social and economical domain; and when Bismarck's projects were rejected by a hostile majority the Emperor openly interposed to give the Prince's proposals the weight of his sanction. At the opening of Parliament on the 12th of February, 1879, William said that repressive laws were not sufficient to solve the socialistic problem, but that it was necessary to do something to cure the evils from which the working classes were suffering. Two years later, on the 17th of November, 1881, he put forth the same idea still more emphatically. He again recommended the Parliament to adopt laws for the working classes, saying that while the reforms which he desired could not be suddenly realized, he felt himself bound before God and man to take the initiative without considering the probability of immediate success. Dissatisfied with the dilatoriness of the Parliament in dealing with the Workmen's Accident Insurance bill, which was brought forward by the government and provided for a state insurance, the employers being called upon to guarantee the premiums,

William sent them a special message on the 14th of May, 1883, requesting them to terminate the debate on the Budget in the first part of the session, so that they might devote themselves to an examination of the economic measures which were before them. In the session of 1884, a bill for the continuation of the repressive law against the socialists was introduced and met with a violent and teuacious opposition, and on the 22nd of March, when William received the Parliamentary Deputation which came to congratulate him on his birthday, he again expressed in strong terms his surprise at the dilatory manner in which this question was being treated by them. He said that the opposition seemed to have forgotten the circumstances by which the law was called forth. He had to shed his blood before the dangers menacing society were recognized. The opposition to the anti-socialist law was therefore directed against his own person. On the other hand he was firmly attached to the laws for the benefit of the working classes, and he requested the members of the Deputation to use all their influence for their adoption.

The Emperor's allusion to the shedding of his own blood as a result of socialistic agitation was justified not alone by Dr. Nobiling's attack on him. In September, 1883, the national monument at Niederwald near Rudesheim on the Rhine — a colossal figure representing Germania looking out across the frontier — was unveiled by his Majesty to commemorate the victories of the war of 1870. This imposing monument, which strikes the eye of every tourist on the Rhine to-day, was dedicated by William "in memory of those who fell; in gratitude to those who live; in emulation of those to come." Little did he or any of the brilliant staff who were present with him at this ceremony imagine the horrible plot which had been laid at that moment to destroy his Majesty's life. While addressing the assembled throng, William was literally standing upon a volcano, but happily there was no eruption. It was not until some months afterwards that the knowledge of a third diabolical plot to assassinate William was brought to the authorities. A stone bottle containing dynamite was found in a drain running across the road by which the Emperor was to pass. Three men, Reinsdorf, Kuchler, and Rupsch, were arrested and tried for the conspiracy. Rupsch confessed while in prison that he had placed the bottle with the dynamite in the drain at the instigation of Reinsdorf, but said he did not light the match, because he had intended from the first to frustrate the plot. His story was not believed, and he and his accomplices were sentenced to death. The Reichstag at once passed a bill on May 15th, 1884, providing that the manufacture, sale and possession of explosives, and their importation from abroad, should only be permitted by authority of the police, and imposed the punishment of penal servitude upon anyone who wilfully endangered life or property by means of explosives, or incited to the commission of such a crime by speeches or the publication of pamphlets. Another bill provided for the extension of the law against socialism until September, 1886. The parliament made more difficulty about the passage of the latter bill, and the Emperor was obliged personally to remonstrate with them for their slowness. Bismarck spoke earnestly in favor of the bill, and even held out a threat of dissolution; the measure finally passed by the narrow majority of 189 to 157.

Meanwhile the parliamentary policy of Bismarck had been silently undergoing a considerable change. By the help of the Liberals he had carried on the "Kulturkampf," and now that its objects had been attained, he found himself face to face with the equally dangerous problem of socialism, in dealing with which his former allies, the Liberals, had become an opposition. Some of the Falck measures had been distasteful to the Emperor, and all of them especially so to the Dowager Queen Elizabeth, for whom William had a profound regard. Influences from opposite directions were thus operating upon the chancellor to break with the Liberal party. He, therefore, welcomed every chance of renewing old ties with the Conservatives. Both the Emperor and the Empress Augusta deplored the "Kulturkampf" as a national calamity, which could not too speedily be brought to an end. The pressure they put upon Bismarck was strengthened by overtures which Pope Leo XIII made to the Emperor immediately after his accession in 1878. Very soon the German government began a course of legislation which gave the wits of the press and diplomatic circles occasion to suggest that Bismarck was going to Canossa after all. On the 7th of February, 1878, Pius IX died, and Leo XIII lost no time in writing to William expressing his regret at the interruption of the friendly relations which had formerly existed between Germany and the Holy See. To this William replied, on the 24th of March, gladly accepting the Pope's assurance that he would use his influence "to induce those who have hitherto proved refractory, to follow the example set them by their flocks, and conform to the laws of the land in which they dwell." On the 17th of April, the Pope again wrote to congratulate the Emperor on his escape from Hœdel's murderous attempt upon his life, but declined to use his influence with the clergy in the sense demanded by the Emperor, and referred to some of the Falck laws as a direct violation of the rights of the church. This letter arrived in Berlin while the Crown Prince Frederick was acting as regent, and his reply, while expressing the firm determination of the Prussian sovereign to remain independent of the control of the church, professed a readiness to approach the questions at issue in a liberal spirit. "The demand advanced in your letter of the 17th of April, that the constitution and laws of Prussia should be modified to meet the principles of the Roman Catholic church," wrote Frederick, "is one which no Prussian sovereign will be able to admit, because the independence of the monarchy, which it is now my duty to defend as an inheritance received from my fathers and an obligation owed to my country, would cease to be absolute if the free development of its legislation were to be subordinated to the control of another power without. Though it is, therefore, not in my power, and perhaps not in that of your Holiness either, to remove an antagonism of principles which has for a thousand years been more keenly felt in the history of Germany than in that of any other country, I am, nevertheless, prepared to meet the difficulties which both parties have inherited in this conflict in the peace-loving and liberal spirit which my convictions as a Christian enjoin." The ice being thus broken by Frederick's tact, a high dignitary of the church suggested that Rome might be reached without passing through Canossa, and Bismarck was eager to act upon the hint. His old allies, the Liberals, were going too fast for him, and the alarming spread of socialism and rationalism convinced him that it was full time to break away from them. In June, 1879, he accepted the resignations of Dr. Falck and of the Ministers of Finance and Agriculture, and on the 9th of July openly announced his separation from the National Liberal party. In the session of 1882, Dr. Windthorst carried a bill through the Prussian Parliament for the repeal of the law prohibiting the exercise of ecclesiastical functions without authority from the government, and another measure was also passed restoring to their sees several of the deposed bishops, who had for some years been living in Rome. A plenipotentiary was appointed to the Vatican, and at last the Emperor was able to announce to the Prussian Chambers that the "Kulturkampf" was ended, and that Prussia was once more on friendly terms with the Pope. One by one the offensive features of the "laws of May" were relaxed. The grants from the state to Catholic bishoprics and parishes, which had now been provided with pastors acceptable both to the Pope and the government, were restored. The Prussian government, however, held out firmly against allowing Ledochowski to return to the archbishopric of Posen, and refused to permit a Polish priest to be his successor. The Pope settled the difficulty by making Ledochowski a cardinal and nominating a German priest of East Prussia to the archbishopric of Posen. The Crown Prince Frederick was sent on a mission to strengthen still further the new friendship between Berlin and the Vatican. In December, 1883, he paid a visit to the King of Spain at Madrid, and returned home by way of Italy. Victor Emmanuel had paid his respects to Emperor William at Berlin in 1873, and William had in return visited him in 1875 at Milan, then the Italian capital. The relations between Germany and the Vatican at that time prevented William from going to Rome, but in the spring of 1884 the Crown Prince, on his way home from Spain, paid a visit as his father's representative to both the King of Italy, now installed in the palace of the Quirinal, and to the Pope. Frederick's tact enabled him to perform both errands without offending the susceptibilities of either King or Pope. The Pope received the Prince with cordiality and with royal honors, and expressed a hope that he might live to see all differences between the church and the German government terminated by a lasting peace. Bismarck still further gratified his Holiness in the course of the year 1885 by asking for his mediation between Germany and Spain in regard to the protectorate of the Caroline Islands. Spain had claimed the suzerainty of these islands since the seventeenth century, but had never taken actual possession of the territory. In pursuance of Bismarck's new colonial policy, of which we have yet to speak, Germany had repudiated the Spanish claim and hoisted her own flag upon one of the islands. Spain protested, and Bismarck asked for the Pope's mediation. By this stroke of policy he not only gratified the Pope, but silenced for the time his clerical opponents, the "party of the Centre," at home. Spain could not do otherwise than consent, and in a month the decision of Leo XIII was given, upholding the claim of Spain to the sovereignty of the islands, but granting to Germany the right of forming agricultural colonies there, and establishing coaling and naval stations. Further concessions were made to the Vatican by the Prussian Parliament in the same year, amounting almost to a total abandonment of the famous "laws of May." A bill was passed restricting government control over the Catholic seminaries, abolishing the ecclesiastical tribunal, and giving back to the Pope and the bishops supreme jurisdiction over the clergy. The truce thus concluded has remained unbroken through the reigns of William's successors to the present time.

The modern empire has had two other disturbing elements to deal with, one dynastic and the other national and it has dealt with them successfully. Several of the princes who had been deposed in 1866 made their peace with William after the war of 1870. The Elector of Hesse Cassel having died in exile in 1875, his son made a compromise with the Emperor, by which he and his family renounced all their claims to the Electorate. The Duke of Nassau had long resigned himself to the loss of his crown, and the marriage of his daughter in 1885 with the eldest son of the Grand Duke of Baden and grandson of Emperor

William I, confirmed his reconciliation to the court of Berlin. Another marriage removed the last trace of the ill feeling caused by the Schleswig-Holstein question, when Prince William, the eldest son of the Crown Prince Frederick, married Victoria, daughter of the Duke of Augustenburg, in 1880. The Emperor made his consent to this match conditional upon the acknowledgment of the status quo by Duke Frederick; and the Duke issued a declaration stating that the duchies of Schleswig and Holstein having been liberated from Denmark and become an integral part of Germany, he relinquished his personal interest to that of German unity. He died at Wies-Baden in January, 1880, at the very moment when this declaration was placed in the Emperor's hands. Frederick's son and heir, Duke Ernst Gunther, as well as Prince Christian, brother of the deceased duke and son-in-law of Queen Victoria, confirmed that declaration and received pecuniary indemnities for so doing. The King of Hanover still remained unreconciled, and had partisans in both the Prussian Chamber and the Imperial Parliament, calling themselves the Guelph faction, who always voted with the opposition. George V of Hanover died on the 12th of June, 1878, but his son and heir followed the same course as his father. He took the title of Duke of Cumberland, and in December, 1878, married a daughter of the King of Denmark. When the Duke of Brunswick died in 1885, he was the next heir, but the Federal Council of the empire declared him incapable of succeeding to the vacant duchy, and appointed Prince Albert of Prussia, a nephew of the Emperor, as regent. "The future will show," says a French writer, M. Simon, "whether this regency is the prelude to the creation of a state for the younger branch of the house of Hohenzollern, or to incorporation with the Prussian monarchy; in any case it adds another success to the many successes of the Emperor William."

Alsace and Lorraine.

The government of the conquered provinces of Alsace and Lorraine was a serious problem for the cabinet of Berlin. These provinces could not be placed under the rule of Louis of Bavaria, the promoter of William's imperial dignity, passing by the Grand Duke of Baden, William's son-in-law; and William himself was aware that there were insuperable obstacles to their annexation to his own hereditary dominions. The inhabitants of Alsace, who had been in sympathy with France in the Waterloo era, were so still, and Bismarck concluded that the best way to humor their susceptibilities was to make of the conquered provinces a "Reichsland," an autonomous state, governed by a lieutenant of the Emperor. But as a first experiment he decided upon a dictatorial regime, and obtained the passage of a law on the 3rd of June, 1871, providing that these provinces should be governed by imperial decrees from Berlin until the first of January, 1873. When the Deputies from Alsace-Lorraine took their seats in the Imperial Parliament, they sided with the other discontented groups who voted with the Opposition. In 1874 the constitution of the empire was introduced into Alsace-Lorraine, and Strasburg became the seat of a deputy of the Emperor, surrounded by ministers and a parliament, who ruled the country independently of the German administration. The spirit of the people has shown little change, but this may be owing to the strict rule of General Manteuffel, the first governor, whose antecedents as Minister of Frederick William IV and as Governor of Schleswig after the Danish war made him singularly unfit for the duties of a pacificator. The Emperor visited Alsace several times to preside over local solemnities or to direct military manœuvres, and always met with the respect due to his great age and personal character, but while welcomed by the upper classes, the multitude stood aloof, and it was not till after the death of Manteuffel, and the appointment of Prince Hohenlohe as his successor in 1885, that the reserve of the people toward the Imperial house began to abate.

The Poles in the provinces of Posen and eastern Prussia have always been a thorn in the side of the Prussian government. In 1871 the inhabitants of these provinces protested against being swallowed up in the German Empire, and demanded autonomy, but they were sternly silenced by Bismarck. Their race antipathy to the Germans was aggravated by the antagonism between the State and the Catholic church. The Polish priests united their efforts with the political agitation of the upper classes, and it became difficult to determine whether a Polish Deputy in the Parliament of Berlin had been elected to defend the cause of Poland or that of the Church of Rome. In 1885, in consequence of the disaffection of this Slavic people, brought about by the priests under the influence of Ledochowski, the Prussian Parliament passed a law for the expulsion of all Poles who were not Prussian subjects. Some of them took refuge in Austria and many in the United States. Another bill was approved granting one hundred million marks for the purchase by the State of mortgaged Polish districts, and for transferring to the State the supervision in such districts of popular education. The result of this legislation is yet to be seen.

The military organization of the empire was always a question of the first importance to William and his advisers. The constitution of the Northern Confederation had fixed the effective force and the military expenses for a period ending in 1871, and at the end of that period the Confederation itself had been absorbed by the new empire. It therefore became necessary in the first session of the Imperial Parliament to pass a new army bill. William would not be satisfied with anything else than the application to all Germany of the system prevalent in the North. He would not have an army depending for support on the votes of parliamentary majorities. As he had formerly expressed himself, "I desire a royal, not a parliamentary army." But as things were yet in a state of transition, the government contented itself with fixing the military budget for three years. In 1874 the question had again to be passed upon by the diet. The government demanded an effective force of 401,600 men, to be maintained as long as the law did not decree otherwise. But a law of the empire which could only be modified by the united consent of the Emperor, the Federal Council and the Parliament, was recognized by all as an infringement of the Parliament's control over the Budget. The Opposition were vainly appealed to by the leaders of the army, who pointed out that foreign powers were jealous and hostile, and that France in particular was only awaiting her opportunity for revenge. "If you wish for peace, be prepared for war," said Count Von Moltke. Finally it was agreed, by way of compromise, that the effective force of the army should remain invariable for a period of seven years. The septennial military grant was voted on the 14th of April. Some months later the organization of the army was completed by the creation of the "landsturm," comprising the men who had left the ranks and the reserve, who were required to undertake the defence of fortresses and of German territory. Through these various organizations the German army numbered on the 1st of January, 1878, in time of war, 1,283,791 men, to whom were added 900,000 of the "landsturm," making a total of over two million soldiers. But even this number did not appear sufficient to the Emperor and his ministers. The septennial period ending on the 31st of December, 1881, the government proposed in the session of 1880 its prolongation until the 31st of March, 1888, and also demanded an increase of the effective force in time of peace to 427,270 men, and the calling out of the first class of reserve for the periodical manœuvres. After violent debates, the new law was passed on the 15th of April, 1880. The result was highly gratifying to William. A few months afterwards, his grandson, the present Emperor William II, who had just been married to the young Princess of Augustenburg, received his Colonelcy in the 1st Foot Guards, and the Emperor, in presenting him his commission took occasion to review the military history of the empire.

With the concentration of formidable military power in the hands of the Emperor, was combined a policy of resistance to parliamentary demands which were thought to encroach upon the imperial prerogative. William made a point of showing that he was the only initiator and promoter of all the acts of the government, and he boldly assumed the full responsibility of these measures, as we have seen in his correspondence with Pope Pius IX. In this respect his ideas had not been modified since his coronation as King of Prussia in 1861. On the contrary, his years and his brilliant triumphs only fortified his conception of Royal authority. In his opening speech at the autumn session of the Prussian Parliament in 1871, he drew a broad line of demarcation between the jurisdiction of the German Reichstag and that of the Prussian Parliament; while the maintenance of the national power and security belonged to the empire, it was for the Prussian representatives to devote themselves to the healthy development of internal institutions. Some years afterwards, when the Reichstag protested against the expulsion of the Poles, he applied the same doctrine to them, and told them plainly they had nothing to do with measures which solely concerned the internal policy of Prussia. While keeping both Parliament and Reichstag in their proper place, he in 1872 administered a check to the power of the nobles. A bill to remodel the administration of the six provinces of East Prussia was introduced in the Prussian Chamber, which proposed to abolish the last remnant of feudal government in the Prussian Kingdom. Heretofore the magistrates and county assemblies of these provinces had been exclusively composed of landed proprietors. It was now proposed to admit a large number of townspeople and villagers to the county assemblies, and to bestow upon the villages the right of chosing their municipal officers. The bill passed the Lower House, but was thrown out by the Upper, although the Emperor had intimated to Count Bruhl, the President of the Upper Chamber, that he desired and expected it to pass. The feudal lords, whose arbitrary rights were struck at by the bill, of course declined to vote for the extinction of their own power and influence. A constitutional crisis was the result. To carry the measure, William was obliged, reluctantly, to create twenty-five new peers, and a letter which he wrote to a Conservative member of the Lower House had the effect of turning many votes, so that ultimately the bill was passed.

Imperial and Prussian jurisdiction defined.

Feudalism abolished.

The just and humane solicitude shown by the Emperor and his first minister for the material welfare of the masses was injuriously misinterpreted by a new band of agitators, comprising members of the aristocracy and ministers of the Protestant church, who abused, in language as violent as the socialists had ever used, the "rapacious middle class," whose leaders they asserted to be of the Jewish persuasion. Thus began the "Judenhetze," or persecution of the German Jews, in 1880. Herr

Persecution of the Jews.

Stocker, the Emperor's court chaplain, was the leader of this disgraceful movement. He made himself temporarily notorious by his extreme activity in forming an anti-Semitic political party, in organizing meetings and inducing people to sign petitions. The Jews were referred to in these documents as a dangerous class, and it was pointed out that while the census of 1871 showed a Jewish population in France, Italy and Great Britain amounting altogether to only 40,000, there were in Germany 512,000. Riots broke out in Berlin, sometimes caused by the Jews themselves, but in most cases by their nominally Christian antagonists. The Emperor did not bestow serious attention on an agitation which, however much it may have alarmed the Jews and excited the multitude, he considered merely ephemeral, and which the Crown Prince had blamed in public in the severest terms. When the Prussian Chambers assembled in October, 1880, a petition was laid before them asking that the Jews should be placed under police supervision, and that restraints should be placed by the government on Jewish immigration. No action was taken, but the government announced its determination not to permit the civil rights of citizens of any religious denomination to be interfered with. The constituents of Herr Stocker showed their appreciation of his zeal by retiring him in the following year.

The victories of 1870 made William the arbiter of continental Europe. The excesses of the Commune in Paris drew the three emperors into a closer intimacy. In 1871 the Emperors of Germany and Austria had several interviews on Austrian territory, at Ischl, Salzburg, and Gastein, at which a plan of general policy was agreed upon. The principle of non-intervention was applied to Italy on the Roman question, and to France in her internal affairs; Germany was to assist Austria should she be attacked by Russia; and united opposition was to be made to the excesses of social democracy. A sponge was passed over the events of 1866. Next year there was a grand conference of the Emperors of Russia, Austria and Germany at Berlin, and while they were discussing affairs from their point of view, the three Chancellors, Bismarck, Gortschakoff, and Andrassy, were also holding consultations. The hopes of France for an alliance against Germany were shattered, and the Pope had to give up the prospect of an ally in the Austrian emperor, "the born defender of the church." The cabinet of Berlin obtained the recognition by Russia and Austria of the conquests of 1870, and the closer union of these two powers under the auspices of Emperor William. From that date the three emperors confirmed their amity by visits to the respective territories of each.

Russo-Turkish war.

In 1877, when Russia declared war against Turkey, Germany remained neutral in spite of the remonstrances of England. But when Russia had arrived at the gates of Constantinople, and imposed upon Turkey the treaty of San Stefano, which deprived the Sultan of nearly all his European possessions, England and Austria joined in armed protest; Austria mobilized her troops, and England sent a squadron into Turkish waters. The mediation of Germany was called for by Russia, and a congress met at Berlin during the regency of the Crown Prince Frederick. William would probably have intervened in favor of his nephew, the Czar, but England and Austria found powerful supporters in the Crown Prince and Bismarck. Turkey was condemned to pay the costs, and be shorn of much of her territory. Some provinces in Europe and Asia fell to the share of Russia; Cyprus to England; but what annoyed Russia the most was that Austria was installed in the possession of the western portion of the Balkan peninsula, comprising Bosnia and Herzegovinia. Such a division of the spoils so disgusted Prince Gortschakoff that he exclaimed, "This congress is the blackest part of my career." A coolness grew up between Russia and Germany in consequence, and on the 15th of October, 1879, a treaty was concluded between Germany and Austria ostensibly for defensive purposes, but plainly directed against Russia. The two powers agreed to maintain the state of things established in central Europe, and to assist each other to repel foreign aggression. The assassination of Alexander II in March, 1881, brought the courts of Berlin and St. Petersburg into more friendly relations. Gortschakoff resigned, and in 1883 a league of peace, or triple alliance, was formed by the three great empires, which has not since been disturbed. With England the German Empire has always been on good terms, notwithstanding the fact that in 1872 William decided the San Juan question in favor of the United States and against Great Britain; and the same can be said of its relations with the United States, the disagreement with regard to the importation of American animal products having been easily adjusted by diplomacy.

In 1884 Bismarck turned his attention to colonial settlements, with a view to providing new markets for the products of German industry, and opening a vent for the superfluous energy which was too often spent in mischievous agitation. Some German merchants, who had settled in Africa and Australia, solicited in 1876 the protection of the German flag for their enterprises, but the Parliament of Berlin gave no encouragement to this new idea, and it startled William himself. Not so with Bismarck. He encountered British diplomacy in this field, and succeeded in obtaining recognition for German settlements on the Congo. Great Britain welcomed Germany as a neighbor in the district of Cape Colony, and as a further step in German colonization, a convention was concluded between Germany and the Transvaal republic. The German government now took its place among the colonial powers in West Africa. Shortly afterwards a dispute arose with England about the Cameroons and a part of New Guinea, but on both questions England came to terms with Germany. The future of Bismarck's colonial policy is as yet unrealized. The military system of the empire excludes the use of German troops in distant countries, and though the Germans are ready, without any government incentive, to emigrate to America to improve their fortunes, war in a tropical climate has no charms for them.

Death of Emperor William I

The year 1888 was a sad one for the imperial house of Germany. William's health had for some time been breaking, and the end of his honored life was known to be near; but a cancerous malady which had attacked the Crown Prince caused all the loyal subjects of the empire still greater alarm. It was a question during some months whether the aged Kaiser or his son would be the first to die. The Crown Prince had been suffering from the effects of a cold, but was sufficiently recovered to be able to attend the ceremonies in honor of Queen Victoria's jubilee in 1886, and after that was over he took up his abode at the Villa Zirio, at San Remo, in Italy. His malady progressed so rapidly that in February, 1887, the doctors attending him decided to perform the operation of tracheotomy, and he then had to breathe through a tube inserted in his throat. The news of his son's condition greatly depressed the Emperor, and hastened his end. On the 9th of March, 1888, William I passed to his fathers. His son, Frederick III, arrived at Berlin on the night of the 11th, in the midst of a snow and sleet storm, which told seriously on his enfeebled constitution. King Humbert of Italy accompanied him as far as Genoa. Prince Bismarck and the other members of the imperial government met him at Leipsic, and escorted him to the capital. Frederick was unable to attend the funeral of his father, but watched the procession from a window of the palace, as it went past toward the mausoleum in the Garden of Charlottenburg, where Queen Louisa and Frederick William III lie side by side.

Frederick III.

Illness and death of Frederick III.

The reign of Frederick III lasted only three months. The final crisis of his disease set in soon after his removal to the old chateau at Potsdam, where he was born, and to which he now gave the name of "Friedrichskron." Here, surrounded by his family, he died on the 15th of June. He had left behind him a rescript addressed to Prince Bismarck, setting forth his projects of government. It stated that the constitutional rights of all the federal governments must be recognised as much as those of the Imperial diet; urged the necessity of keeping up the army and the growing navy and commanded toleration of all religious sects. He expressed his desire to support "every movement toward furthering the economic prosperity of all classes of society, reconciling their conflicting interests, and mitigating if possible unavoidable differences, without encouraging the anticipation that every social evil can be remedied by state intervention." "I consider," he said, "as intimately connected with the social question the control of the education of youth while the higher education must be extended. We must beware of the danger of half education, awakening demands which the nation's economic development is unable to satisfy." The memory of Frederick III is regarded not only in Germany but throughout the world with respect and admiration. A great general, as he proved himself to be in the Austrian and French wars, he was also an enlightened statesman. He held his ground against papal aggression in 1878, and he opposed the persecution of the Jews in 1880. After the victory of Sedan, it was his duty to inspect the military forces of the south German states, and his personal popularity among them did much to inspire among the south German soldiers a loyalty to the changed order of things. To him and to his consort, the Princess Royal of England, several institutions for the encouragement of art owe their origin in Berlin; and to the princess, now known as Empress Frederick, civilization is indebted for such institutions as the Victoria lyceum, the school for the training of nurses, and the school for the higher education of women. During the wars with Austria and France, the Crown Princess had personally superintended the nursing of wounded soldiers in the hospitals. The institution for the training of nurses, which is still performing a beneficent work, was organized by her as the result of her experience during those campaigns.

The eldest son of Frederick succeeded him under the title of William II. His accession was contemplated with concern and apprehension throughout all Europe, because this young prince had shown as yet no indication of the liberal spirit of his father, but on the other hand had given proof of a strong leaning toward military rule. Those fears have been greatly allayed, if not entirely overcome, by the conduct of William II, since he came to the throne. During the summer months of 1888 he visited the courts of Russia, Sweden, Denmark and Italy, and succeded in confirming the friendly relations existing between them and Germany. During the year 1889 he still further strengthened the military and naval armament of Germany, and demonstrated his business and executive ability by settling dangerous strikes and discontent among the working men. A tem

porary misunderstanding between himself and the Empress Frederick relative to the disposal of some private papers of the late Emperor which she claimed as her own property, and which William thought should be deposited among the royal archives of Prussia, gave rise to some newspaper speculation as to a possible rupture of friendly relations between the governments of England and Germany; but this cloud also passed away, and in August, 1890, William made a friendly visit to his graudmother, the Queen, and his royal relatives in England. In March, 1890, an international labor conference was held at Berlin under William's auspices, presided over by Baron von Berlepsch, the Prussian miuister of commerce.

Under William I, Bismarck had been the absolute head of the government, and notwithstanding all his notions of kingly prerogative, the simple-hearted old soldier monarch was accustomed to lean entirely upon the advice of Bismarck. The young Emperor determined to change this system of things, and issued a cabinet order revoking that of 1852 and requiring all Ministers, Bismarck included, to report to him direct instead of making the chancellor their mouthpiece as theretofore. The chancellor felt humbled and slighted by this order; he was now no more prime minister, but a mere head of a department; he who had made and unmade other ministers was now reduced to a level with them. On the 18th of March, three days after the assembling of the labor conference, Bismarck tendered his resignation to the Emperor, alleging age and failing health as his reason. The resignation was accepted, and General von Caprivi was appointed Chancellor of the Empire and president of the Prussian ministry. William publicly thanked Bismarck for his long services to the Imperial house, and conferred upon him the title of Duke of Lauenburg. The departure of Prince Bismarck for his country home at Friedrichsruhe was the occasion of the greatest public demonstration in Berlin since the return of the victorious troops in 1871. The station was literally heaped with flowers, the Emperor and Empress each sending a beautiful floral tribute to the retiring chancellor. The crowd was so great that the police were unable to keep order. As the train passed out of the station the crowd joined in singing "Die Wacht am Rhein." In August, 1890, in virtue of a treaty with the English government, William took possession of the island of Heligoland, which will now become an important station for the German navy. England obtained as compensation the consent of Germany to her protectorate of Zanzibar, which was also ratified by France. The Emperor on taking possession of Heligoland issued a proclamation in which he promised to protect the islanders in the observance of their old customs, in their freedom of religious worship and the education of their youth. The year 1890 closes with every prospect that Germauy will be able to maintain and preserve the peace of Europe, of which she has been, ever since the Berlin Congress of 1878, the recognized arbiter.

## PART III.—LANGUAGE.

In its ordinary sense the name German Language or *Deutsche Sprache* is now generally used to denote, in all their stages from the earliest time to the present day, the different languages and dialects of Teutonic origin spokeu in the German and Austrian empires and in Switzerland, not including, however, the Frisian language, which once was spoken, and still in a few remnants survives, on the shores and islands of the German Ocean, nor the dialects of the Danish population of northern Schleswig. Flemish and Dutch, although very closely connected with German, are likewise excluded. But the word *Deutsch* has also been, and still continues to be, used in a wider sense. Jacob Grimm introduced it, in his famous *Deutsche Grammatik*, as a comprehensive name for that family of the so-called Indo-European or Aryan languages, for which English writers generally use the name of "Teutonic," and of which the principal branches are represented by Gothic, the Scandinavian languages, English, Frisian, and German. In this Grimm has had many followers, but scarcely anywhere out of Germany; and even there the fact that the name, in this application, besides being incorrect from an historical point of view (as the word has never been used thus by any one of the people to whom it has been applied by Grimm), is also liable to be misunderstood, has caused a growing tendency towards confining it again to its original meaning described above, and using *Germanisch*, or *Germanic*, in the collective sense of the English "Teutonic." But even in the stricter sense the designation *Deutsch* is not of very long standing, nor has the word always been a real proper name for a distinct people or tribe. In Bishop Ulfilas's Gothic version of the Bible we find the adverb *thiudisko* (ἐθνικῶς), Gal. ii, 14, which is clearly a derivative from *thiuda* (ἔθνος), meaning primarily "after the manner of the people." German writers of the earlier centuries were therefore as fully justified in calling their own language *diutisc*, or in a Latinized form, *theudiscus, theotiscus*, that is, their popular or vernacular language, as were those mediæval Latin writers of all nations who distinguished their national languages by the name of *lingua vulgaris* from Latin, the only literary language fully acknowledged in their time. It was not until the 10th century that another Latinized form frequently used in later times, viz., *teutonicus*, began to be used instead of the older *theotiscus*, of which the only rivals in former times had been such local names as *franciscus* (*frenkisc*) or *saxonicus*, which were no doubt derived from the names of single tribes, but were often also used in the same comprehensive sense as *theotiscus*, without necessarily implying any allusion to dialectal differences between the languages of the tribes they properly belonged to. The last name we have to mention here is the Latin *Germanus*, with its different derivatives in the modern languages, including the English form *German*. Many attempts have been made to elucidate the origin of this word, but as yet nothing can be taken for certain beyond the fact that it is neither of Latin nor of German origin. Most probably it was a Celtic word, and, according to what Tacitus says in his *Germania* (ch. ii.), it was originally the name of a Celtic tribe, from which, by some strange error of the Roman and Greek historians, it has been transferred to the non-Celtic inhabitants of Germany. Accordingly the name has never been used by the Germans themselves except in imitation of its use in the works of Latin writers.

As to its geographical extension the German language has undergone very great changes in the course of the last two thousand years. At the dawn of history no Germans were to be found to the left of the Rhine, and even to the right of it Celtic tribes occur in the earliest times. There were Celts also in the south of the present Germany as far north at least as the Danube and the Main; Bohemia, too, derives its name from an early Celtic population, the Boii. Only the midland and north were inhabited by Germanic nations or tribes, stretching as far east as Poland, and perhaps covering even parts of the adjoining territories of Russia, where Slavonic and Finnish tribes were their neighbors. But of these Germanic tribes and their languages some have left no equivalents in our modern German tribes and dialects. We have mentioned the Frisian language as not belonging to German in its proper sense, although the Frisians have kept their original residence up to the present day, and have always been in constant connection and frequent intercourse with their "German" neighbors. Many other tribes have wandered from their seats and colonized other countries. It was as late as the middle of the 5th century that the Jutes, Angles, and Saxons began their voyages of conquest to England, where they founded a new people and a new language,[1] leaving their native soil open to Danish invasions. Much earlier the midland tribes had already been slowly pushing on to the west and south, and expelling or subduing and assimilating the Celtic owners of the territories they invaded. But what was gained in these parts was counterbalanced by great losses in the north and east. The territories about the lower and middle Elbe, Oder, and Vistula, abandoned by the Lombards, the Burgundians, the Goths, and some other Germanic tribes, as well as Bohemia, which for some short time had been in the possession of the German Marcomans, were soon filled up by the immigration of numerous tribes of the great Slavonic family. Without going into details of the facts which are well known to the student of history,[2] we may simply state that, since about 500 A. D., when the great migration of the nations had

[1] See the article ENGLISH LANGUAGE, vol. viii. p. 349 *sqq.*

[2] For fuller particulars see C. Zeuss, *Die Deutschen und die Nachbarstämme*, Munich, 1837.

come to an end so far as Germany was concerned, no further change of any great importance has taken place in the western and southern parts. In the east the German population at this time did not go beyond a line that may be drawn from about Kiel to the Böhmerwald, passing near Hamburg, Magdeburg, Naumburg, Coburg, and Baireuth. As is well known, it is in later centuries that almost all the eastern districts have been recovered for the German language.[1]

In the 6th century the remains of the numerous smaller Germanic tribes, mentioned before and during the migration of the nations, had consolidated into seven larger bodies or aggregations of tribes. The Frisians still held the extreme north of Holland and Germany. Their midland and eastern neighbors were then called by the new name of Saxons, borrowed from the Saxons who had left the Continent for England. In the main parts of the Netherlands and Belgium, along both sides of the Rhine, and across Germany to the Thuringian and Bohemian Forests, the powerful Frankish confederation had established itself, and it soon incorporated the smaller and less vigorous tribes of the Hessians and Thuringians, which were surrounded by the midland or eastern Franks, the Saxons, and the Slavs. Alsatia, Switzerland, and South Germany eastward to the river Lech were occupied by the Alemannians, while the inhabitants of the remaining districts of the present Bavaria and Austria bore the collective name of Bavarians.

The history of the German language cannot be severed from the history of these tribes, for Frisian, Saxon, Frankish (Hessian, Thuringian), Alemannian, and Bavarian are the leading dialects of the Continental branch of the Teutonic family. What Dr. J. A. H. Murray has pointed out about the origin of the principal English dialects[2] may equally well be said of these Continental idioms. Having no specimens of the languages of the Continental tribes for nearly three centuries after their final settlement, we cannot tell to what extent they originally agreed with or differed from each other, although there must have been some dialectal differences to begin with, which were afterwards increased and multiplied, partly by phonetic changes (most probably resulting from scarcely discernible phonetic peculiarities, which, even in the earliest times, must have prevailed in those idioms), and partly by such alterations of the inflexional systems as are known to occur frequently in all languages whose character is not merely literary. But, however scanty our means of illustrating the earliest history of these idioms may be, there is no doubt that they were not all of them related to each other in the same degree. Three main groups are easily distinguishable:—(1) Frisian and Saxon, whose nearest relation is English; (2) Frankish, Hessian, and Thuringian; and (3) Alemannian and Bavarian. Frisian is generally considered as a separate language. From Saxon the later Low German dialects (*Niederdeutsche Mundarten*) have sprung. The members of the third group (generally designated as *Oberdeutsch*, or Upper German), combined with *Mitteldeutsch*, or the midland dialects, viz., Thuringian, Hessian, and part of the Frankish dialects, are the sources of the latter *Hochdeutsch* or High German. The greatest difference prevails between the first and third groups; the second may be characterized as containing various transition dialects. The southern Frankish dialects are very closely akin to the adjacent Upper German idioms, while Dutch, the utmost offshoot of the Frankish language to the north, does not very materially differ from Saxon or Frisian in the earliest period. The most striking phonetic feature of the languages of the first group is their regular dropping of the nasal sounds before the spirants *f, th, s*, accompanied by subsequent lengthening of the preceding vowels. Thus we have in Anglo-Saxon or Old English *fíf, óðer, cûð, gós* (Mod. English *five, other, (un-)couth, goose*), in Old Frisian *fíf, óthar, cúth, gós*, in Old Saxon *fíf, óthar, cúth, gós*, corresponding to such Gothic forms as *fimf, anthar, kunths*, or the ordinary High German *fünf, ander, kund, gans*. Since, however, Dutch partakes of this peculiarity to some extent, we cannot easily form a decisive opinion as to the value of this fact as a distinctive mark; but more stress may be laid on a very remarkable difference in the inflexional system of the verb. Here the languages of the first group have melted together the forms of the three persons of the plural number, thus *wé, gé, hie findaþ* or *fundon*, we, you, they find, or found, in Old English; *wí, gí, hia, findaþ*, or *fundon* in Old Frisian; *wí, gí, sia findaþ*, or *fundon* in Old Saxon. The corresponding Old High German forms are *wir findam, ir findat, sie findant* for the present, *wir funtum, ir funtut, sie funtun* for the perfect tense. Old Dutch joins, in this case, the German branch; from *werthan*, to become, for instance, are derived *wí werthun, gí werthiþ, sia werthunt*, etc. The declension of the substantives shows another remarkable difference. While the languages of the first group have retained the original *s* in the nominative plural of such words as Old English *dagas*, days, Old Saxon *dagos*, or changed it to *r*, as Old Frisian *dagar*, Dutch and German have dropped it altogether, the corresponding forms being *daga* and *taga* These facts must be taken for decisive, as it seems to be certain that they existed before any distinction of Low and High German in their modern sense (a distinction chiefly dependent on subsequent changes in their mute system) could be thought of. From a purely grammatical point of view, Dutch, although generally considered a separate language (which no doubt it is, with regard to its literary and political position), is entitled to claim a closer relation to High German than even Low German, whose non-literary character, taken along with the political union of northern and southern Germany, has led to the current opinion that it is only a dialect of "German" in its narrower sense. We do not mean to deny that there is, at present, a more conspicuous conformity between Dutch and Low German than between Low German and High German; but this is only due to the fact that High German, after the final settlement of the German tribes, has deviated much more from its original features than either Dutch or Low German. The most striking peculiarities of High German, as opposed to all other Teutonic idioms, have mainly been caused by the second or High German "Lautverschiebung," or change of mute consonants, which forms part of a long series of sound-changes generally comprehended under the name of Germanische Lautverschiebung or Grimm's Law. This Lautverschiebung began, perhaps as early as the 7th century in the south, and thence slowly spread northward, but with decreasing vigor and consistency, Dutch and Low German not being touched at all. It was only thus that the idiom of the Netherlands Franks of the later centuries was separated from the dialects of their "German" relations. Before, however, the first literary documents are met with, this separation is complete; and we may therefore restrict ourselves here to a short history of High and Low German alone.

The German language presents, as do most of the cognate tongues, three main stages of development,—Old, Middle, and Modern,—distinguished by their inflexional and literary character. In accordance with Mr. Henry Sweet's description of the stages of the English language,[3] Old German may be defined as the period of *full* inflections (Old Low German, *dages, dage, dagu; dagôs, dago, dagun;* Old High German, *tages, tage, tagu; tagâ, tago, tagum*), while the Middle period is that of *levelled* inflections (Middle Low German, *dages, dage, dagen;* Middle High German, *tages, tage, tagen*); but it is chiefly the literary character that distinguishes Modern High German from Low German and its own earlier stages. A special form of High German is established in this period for all literary purposes, supplanting the dialects both of Low and of High German that formerly were freely used in literary intercourse. Assuming two periods of *transition* besides, we have the following divisions, with the approximate dates:—

| | |
|---|---|
| Old High German | to 1050 |
| Early Middle High German | 1050 to 1150 |
| Middle High German | 1150 to 1350 |
| Late Middle High German | 1350 to 1500 |
| Modern High German | 1500 onward. |

The same divisions have to be made for Low German, but the scheme cannot be so fully carried through, as the time between 1000 and 1200 is almost destitute of literary monuments.

*Old German.*—The inflexional characteristics of Old German are almost identical with those of Old English. Nouns had the same five cases,—nominative, accusative (only in a few instances kept distinct), genitive, dative, and instrumental. Strong and weak declensions of nouns and their

[1] See G. Wendt, *Die Nationalität der Bevölkerung der Deutschen Ostmarken vor dem Beginne der Germanisierung*, Göttingen, 1878.

[2] See ENGLISH LANGUAGE, as above, p. 350.

[3] See article ENGLISH LANGUAGE, vol. viii. p. 350.

subdivisions are likewise the same. The dual of the first and second personal pronouns is almost extinct in Old High German, but is quite common in Low German. In the verb we find the same distinction of the subjunctive from the indicative mood, and the same two inflected tenses, present and past,—the former also used for the future. the latter for all shades of past time. The order of the sentence corresponds generally to the modern use, but is not kept so strictly as now, especially in the oldest prose texts, which are often materially influenced by the Latin sources from which they have been derived or translated.

The earliest extant specimen of Low German belongs to the beginning of the 9th century. It is a short formula of renunciation of the devil to be used before the ceremony of baptism.[1] It begins thus:—"Forsachistu diobole? et respondeat: ec forsacho diabole. End allum diobolgelde? respondeat: end ec forsacho allum diobolgelde. End allum dioboles uuercum? respondeat: end ec forsacho allum dioboles uuercum and uuordum, Thuner ende Uuoden ende Saxnote ende allum them unholdum the hira genotas sint." "Forsakest thou (the) devil? I forsake (the) devil. And all devil-sacrifice? And I forsake all devil-sacrifice. And all (the) devil's works? And I forsake all the devil's works and words, Thuner and Woden and Saxnot and all the uncouth (beings) that their companions are."

We cannot, unfortunately, tell what special dialect of Low German this piece belonged to, nor even whether it was originally written in German, as several forms occurring in it have rather an Old English look. No more certain are the place of origin and the dialect of the most important relic of the Old Saxon language, the great poem of the *Héliand*, or the History of our Saviour, composed in the old alliterative verse by a Saxon cleric or monk, about the year 830. We quote as a specimen the following lines from the Munich MS.[2]:—

"Quamun managa
Iudeon an thene gastseli; uuard im thar gladmod hugi,
blidi an iro breostun: gisahun iro baggebon
uuesen an uunneon. Drog man uuin an flet
skiri mid scalun, scenkeon huurbun,
gengun mid goldfatun; gaman uuas thar inne,
hlud an thero hallu, helidos drunkun."

"(There) came many Jews to the guest-hall; became to them there glad (their) mind, blithe in their breasts: (they) saw their ring-giver be in joy. Wine was borne into (the) hall bright in cups; cup-bearers walked about, went with golden vessels, joy was therein loud in the hall, the knights drank.

Much more numerous and various in age and dialect are the documents of Old High German, some of which date as far back as the 8th century. Welcome as they may be to the student of grammar, not much can be said for their intrinsic value. Almost all the prose pieces are mere translations (many of them could not be worse) from the Latin; and even such poetical works as Otfrid's *Life of Christ*[3] are no more than prose thoughts forced into bad verse. Only a very few relics of true poetry have reached us, among which the *Hildebrandslied* (in a mixed dialect), the fragments of the *Múspilli* (a poem about the Last Judgment, in the Bavarian dialect, belonging, like the *Hildebrandslied*, to the beginning of the 9th century, and also written in alliterative verse), and the *Ludwigslied* (881 or 882, in one of the Frankish dialects) may be mentioned here.[4]

High German, as already hinted, is chiefly distinguished from the other Teutonic languages by a certain transformation of its mute system. The ordinary changes,—that is to say, those received in the modern High German literary language,—are the following:—*d* is changed to *t* in all positions; *t* to *z* (either pronounced *ts* or *ss*); *p* to *pf*, *ff*, or *f* according to its position in the word; *k* initial and following a consonant is kept, but after a vowel *k* passes into *ch* (pronounced as Scotch or Modern German *ch*). Thus we get the following comparisons:—

| Old English. | Old Saxon. | Old High German. | Modern High German. | Modern English. |
|---|---|---|---|---|
| dón | dón | tuon | thun | do |
| tó | tó | zuo | zu | to |
| sealt | salt | salz | salz | salt |
| settan | settian | sezz | setzen | set |
| etan | etan | ezzan | essen | eat |
| pund | pund | pfunt | pfund | pound |
| hearp | harpa | harpfa, harfa | harfe | harp |
| slǽpan | slápan | sláffan | schlafen | sleep |
| cyning | kuning | kuning | könig | king |
| thencan | thenkian | thenken | denken | think |
| macian | makon | machon | machen | make |

This is the state of things in the High Frankish or Eastern Frankish dialect, spoken in the south-east of the Frankish territory. In the earliest period, as may be seen from the above list, it still preserved the *th* sound in many cases; in the later stages *d* is found to have been substituted, as in Modern High German. The Upper German dialects show the same change at a much earlier time, and, in addition to this, they have also changed *k* initial and following a consonant into *ch*, and *b* and *g* initial into *p* and *k* (representing most likely voiceless soft stops, as still pronounced in South Germany and Switzerland); Bavarian admits *p* for *b* even in the middle of words. Thus we have, for instance, *denchen* for Frankish *thenken*, to think; *pitten* for Frankish *bitten*, to bid; *keban*, or Bavarian *kepan*, for Frankish *geban*, to give. In illustration of these distinctions and some other variations of spelling we may quote three contemporaneous versions of the Lord's Prayer which have fortunately been preserved[5]:—

| *Frankish Version.* | *Alemannian Version.* | *Bavarian Version.* |
|---|---|---|
| Fater unser thu in himilombist, giuuihit si namo thin. Queme richi thin. Uuerdhe uuilleo thin samaso in himile endi in erthu. Broot unseraz emezzigaz gib uns hiutu. Endi farlaz uns sculdhi unsero samaso uuir farlazzem scolom unserem. Indi ni gileiti unsih in costunga, auh arlosi unsih fona ubile. | Fater unsar thu pist in himile, uuihi namun dinan. Qhueme rihhi din. Uuerde uuillo diin samaso in himile sosa in erdu. Prooth unsar emezich kip uns hiutu. Oblaz uns sculdi unsaro so uuir oblazem uns sculdikem. Enti ni unsih firleiti in khorunka, uzzer losi unsih fona ubile. | Fater unser, du pist in himilum. Kauuihit si namo din. Piqhueme rihhi din. Uuesa din uuillo samaso in himile est, sama in erdu. Pilipi unsraz emizzigaz kip uns eogauuanna. Enti flaz uns unsro sculdi samaso uuir flazzames unsrem scolom. Enti ni princ unsih in chorunka, uzzan kaneri unsih fona allem sunton. |

It is impossible to give here a sufficient idea of the variability of Old High German, as, indeed, out of several hundred pieces that have come to our knowledge, there are not two representing exactly the same dialect to all its shades or at least in exactly the same spelling. We shall therefore restrict ourselves to a short notice of the more important documents. South-western Frankish is best represented by a very old translation of a treatise by Isidorus Hispalensis, *De Fide Catholica*,[6] and Otfrid's *Life of Christ*, mentioned above. The chief source of Eastern Frankish is a translation of the *Harmony of the Gospels* erroneously ascribed to the Syrian father Tatianus.[7] For Bavarian we may quote some old glossaries,[8] for Alemannian the interlineary versions of the Benedictine Rule[9] and some Latin church hymns,[10] besides several glossaries. For later Old High German, the works of Notker Labeo, or Teutonicus, a monk of St. Gall who died in 1022, are the fundamental sources.[11] What Ormin did for English phonetics, Notker may be said to have done, even more completely, for those of Germany. He not only carefully marks the quantities of vowels, but also points out the phonetic difference between such diphthongs as *ei*, *ou*, *iu*, and *ie*, *uo* by his way of accentuating them (*éi*, *óu*, *íu*, and *íe*, *úo*); even such phonetic minutiæ as the change of initial voiced stop consonants into voiceless stops after a pause or a voiceless consonant are duly registered, as may be seen from the following specimen. "Sanctus paulus kehîez tîen dîe in sînên zîten

[1] It has been published along with all the minor pieces of Old Saxon still extant, by M. Heyne, *Kleinere altniederdeutsche Denkmäler*, 2d edit., Paderborn, 1877. See also K. Müllenhoff and W. Scherer, *Denkmäler deutscher Poesie und Prosa*, 2d edit., Berlin, 1873.

[2] This MS. gives the poem in a pure Saxon dialect, while the dialect of the Cotton MS. in some respects resembles the Frankish idiom. Both texts are printed in the latest edition by E. Sievers, Halle, 1878.

[3] Otfrid, a monk of Weissenburg, in Alsace, formerly a pupil of Hrahanus Maurus, at Fulda, wrote his work (in the South-Frankish dialect) in 867 or 868. It is for the most part due to him that the rhymed stanza (imitated from that of the Latin Church hymns) was introduced into German poetry, instead of the earlier alliterative metre. The latest editions are by J. Kelle, Ratisbon, 1856, 1869, and by P. Piper, Paderborn, 1878.

[4] The minor pieces of Old High German, both verse and prose, are collected in Müllenhoff and Scherer's *Denkmäler*, 1873.

[5] Ten different versions of The Lord's Prayer (down to the 14th century) are given in a synoptical order. by Massmann, *Die deutschen Abschwörungs-, Beicht-, und Betformeln*, Quedlinburg and Leipsic, 1839, p. 158 *sq.*

[11] Hattemer, *op. cit.*, vols. ii., iii.

uuândon des sûonetagen, taz er êr nechâme êr romanum imperium zegîenge únde antichristus rîchesôn begóndi. Uuér zuíuelôt romanos íu uuésen állero rîcho hêrren únde íro geuuâlt kân ze énde dero uuérlte?" "St. Paul assured those who in his time expected the day of judgment that it would not come before the Roman Empire was dissolved, and Antichrist began to reign. Who doubts that the Romans are the masters of all kingdoms, and that their power reaches to the end of the world?"

It will be clear from what has been said above that the main feature of the Old High German period is the total absence of a common literary language. No voluntary modifications of the form of speech are to be found, but such as are naturally involved in any attempt to adapt a spoken idiom to literary use. Nevertheless it has been suggested by K. Müllenhoff[1] and others that idioms of a more refined character than the ordinary popular dialects were spoken at the principal courts of the empire, and especially at the imperial court itself, and that the authority of these *Hofsprachen* was great enough to exercise a modifying influence on the literary productions throughout the empire, or in those parts at least where High German was the vernacular speech. But how these suppositions can be proved does not appear, or how they can be reconciled with the fact that all literary documents of the period *are* dialectal.

*Middle German.*—The transition to Middle High and Low German is conspicuously marked by a decided improvement in the poetic faculties of the nation.[2] While the 10th century has left only a very few specimens of poetry, and these of poor quality, the number of poems (mainly of a theological bearing) dating from the 11th century is not inconsiderable, and the 12th century shows a rapidity of literary development almost unparalleled. At first indeed religious and legendary poetry is still prevalent, but soon literature begins to take a more historical or epic turn. This tendency is clearly visible in the *Kaiserchronik*, or Emperor's Chronicle, in which the first attempt is made to give a survey of universal and German history in a poetical form. The romantic tales of Alexander the Great and of the battle of Roncesvalles were translated from the French,—the *Alexanderlied* by the Pfaffe Lamprecht, the *Rolandslied* by the Pfaffe Konrad; while old national traditions contributed fitting subjects for such epic poems as that concerning the adventures of the Lombard King Rother. Lyric poetry, hitherto altogether neglected, sprang suddenly into vigor in the remote east of Austria about the middle of the century, and soon found its way to other countries. But the most decided advance was not made till about 1180, when the new forms of social life that had crept in among the more cultivated classes, in imitation of the laws and customs of French chivalry, began to exercise a powerful reforming influence on all branches of poetry. The example set by the Netherlands poet, Heinrich von Veldeke (who for some time lived, and partly wrote, in Germany), in his *Eneit* or *Æneid*, was soon followed by the three great epic masters of the period, Hartmann von Aue, Gottfried von Strasburg, and Wolfram von Eschenbach. About the same time the *Nibelungenlied* and other compositions of a more national character were composed, while lyric poetry was raised to a height of excellence never attained at any other period of the Middle Ages, and best represented in the songs of Walther von der Vogelweide. It is true enough that this new chivalrous poetry was not always very original in thought; indeed, most epic poems of this class, and many lyric stanzas, have been directly copied from French models; but its influence on the culture of the language was immense. It was then for the first time that Germany possessed a real literary language, undoubtedly homogeneous as far as style and metre are concerned. Whether a similar unity of the outer form of speech had already been reached at that period is a point very difficult to decide. The question was raised for the first time as early as 1820, by Karl Lachmann, in his *Auswahl aus den hochdeutschen Dichtern des XIII. Jahrh.* Lachmann's opinion was that the poets of the 13th century spoke a definite, unchangeable sort of High German, a few minor dialectal peculiarities being excepted, and that uneducated scribes had been guilty of introducing older or corrupt forms of the common speech into our manuscripts. These views were at the time unanimously accepted, and are still held (though in a somewhat modified form, admitting two literary idioms, one in the south, the other in the midland) by a majority of the German philologists of the present day. As a consequence of this, most of the "critical" editions of Middle High German poetry that have appeared since Lachmann's time do not reproduce the original readings of the manuscripts, but give the texts in a "corrected" form, commonly called "correct Middle High German," which is assumed to appear in its purest form in the works of Hartmann von Aue. It is chiefly Alemannian, or Swabian, with some Frankish peculiarities of spelling in the use of the consonants, in order to produce a greater resemblance to ordinary Modern High German orthography. No manuscript, however, is known to be written in exactly the same language or orthography; nor are there any poets, except those of Swabia, who do not clearly show by their rhymes the existence of dialectal forms in their speech. All incongruities in the rhymes disappear when they are transferred to the forms peculiar to the local dialects of their authors.[3] It was therefore but natural that a reaction against Lachmann's views should ultimately have set in;[4] and this reaction appears to have been right in denying that dialectal forms were purposely and studiously avoided, even by the classic authors of the period, with a view to the approximation of their language to a certain universal idiom never existing anywhere but in the fancy of certain modern writers. How injurious to the study of Middle High German dialects the views of Lachmann, had they prevailed, must have been, it is easy to see; but on the other hand it must not be forgotten that the only method of investigating the dialects of the single authors was that followed by Lachmann, viz., to reconstruct them by a careful study of the rhymes, for the dialects of the manuscripts are often, nay in most cases, clearly different from those of the writers themselves, as shown by the rhymes. It is therefore not so much the principle of reconstruction that has been resisted by Lachmann's opponents as the way in which this reconstruction has been practically carried out. For prose writings of course no such reconstruction is possible; still, prose documents, especially such as were destined for local use only (charters, etc.), and therefore less liable to adulterations of the original, are often the main sources for German dialectology.

The prominent feature of German (Low German included) in this period is the levelling of the unaccented vowels of the inflexional and some of the derivative syllables already mentioned. As to the former there is only one exception, viz., the retaining of the termination *iu* (pronounced as Modern German *ü* or French long *u*) for the nom. sing. fem. and the nom. and acc. plur. neutr. of the adjectives (*blindiu*, while all other cases have the levelled *e*); and even this seems to be a specialty of Upper German, the corresponding Midland form being *blinde* as in Modern German. The unaccented *e* is frequently dropped in all dialects, especially in the south, where the dropping is almost regular after an *r* or *l* closing the short syllable, as in *bern, steln*, for *beren, stelen*, to bear, to steal; Old High German, *beran, stelan*. In the Midland dialects *i* is often written for this *e*, thus *berin, stelin*. The accented vowels of the root syllables are greatly changed in this period by the "Umlaut," or mutation of sounds, being an assimilation of these vowels to an *i* or *y* originally following. Thus *a, ā, o, ō, u, ū, uo* are changed to *e, æ, ü* or *ö, œ, ü, iu* (long *ü*), *üe* as may be seen in the following instances:—*hant*, hand, pl. *hende; rāt*, council, pl. *ræte; golt*, gold, *güldîn*, golden, or *mohte*, I might, subj. *möhte; grōz*, great, *grœze*, size; *kus*, a kiss, *küssen*, to kiss; *mūs*, mouse, pl. *miuse; guot*, good, *güete*, goodness. The Umlaut, however, is not always expressed in the spelling of the manuscripts, though it must have existed in the living language. Of the diphthongs, *iu* has been changed into long *ü*, but the old spelling is often retained in the MSS. (*liute*, modern *Leute*, Old High German *liuti*, people). As to the consonants, the *th* sound had nearly disappeared at the beginning of the period, and was lost entirely in its course; *sk* has passed into

[1] See his *Denkmäler*, Introduction.

[2] See W. Scherer, *Geschichte der deutschen Literatur im XI. und XII. Jahrhundert*, Strasburg, 1875.

[3] This has been exemplified in a most masterly manner by W. Braune, in his *Untersuchungen über Heinrich von Veldeke;* see *Zeitschrift für deutsche Philologie*, iv. p. 279 *sqq.* Braune has conclusively shown that Heinrich von Veldeke never tried to write German (although he wrote for German readers), as had generally been supposed before, but simply wrote in his familiar Netherlands dialect.

[4] See especially H. Paul, *Gab es eine mittelhochdeutsche Schriftsprache?* Halle, 1873. Paul seems, however, to go too far in denying the existence of some peculiarities of style pointed out by Lachmann and his followers.

the *sh* sound, written *sch* as in Modern German. Spelling in general is simpler, and in some points more rigidly phonetic than in Old German. Final voiced consonants, as *b*, *d*, *g*, are generally changed into the corresponding voiceless sounds, as *p*, *t*, *c* (in High German *grap*, grave, gen. *grabes*, *pfat*, path, gen. *pfades*, *tac*, day, gen. *dages*; in Low German *graf graves*, *pat pades*, *dach dages*). Double consonants are simplified in the same position, as in Old German (*bal*, ball, gen. *balles*). The use of the letter *v* has greatly increased; in High German it means simply *f*, and is therefore quite superfluous; in Low German its pronunciation is *f* at the beginning of words, while in the middle of words it has the same sound as English *v*.

The leading dialects of the period are those of Old German, the most noteworthy difference being the accession of the dialects of the kingdom of Saxony (*Obersächsisch*, or Upper Saxon) and Silesia to the midland dialects, and those of some eastern provinces of Prussia (*Niedersächsisch*, or Low Saxon) to Low German, in consequence of the German colonization of these countries. Low German, to begin with, has retained the phonetic structure of its consonantal system unaltered, except by the loss of the *th* sound. The spelling of the vowel system is very imperfect. Umlaut is not expressed in the older manuscripts, except in the case of *a* and *e*. A long *e* corresponds to both High German *ei* and *ie*, a long *o* to High German *ou*, *öu*, and *uo*, *üe*, the only diphthong generally admitted being *ou* before a *w*, as in *houwen*, to hew. The pronunciation of *ē* and *ō* must, however, in these cases have been different according to their etymological values, for all the High German sounds mentioned above are distinctly kept asunder in the modern Low German dialects, and *ei* and *ů* or u are often written for *ē* and *ō* where they stand for High German *ei* and *uo* or *üe*, but never otherwise. It is most likely, judging from the present state of things, that open *e*, *o* were the equivalents for High German *ei*, *ou*, *öu*, while close *e*, *o* corresponded to High German *ie*, *uo*, *üe*. The prefix *ge* is dropped, as in English and in the Scandinavian languages (thus *bort*, birth, High German *geburt*). But the most remarkable fact in the history of Low German sounds is the restoration of *nd* or *nn* for *th* after a dropped nasal sound (see above, p. 462), as in *ander* or *anner*, other, for Old Saxon *óthar*, or in *munt*, mouth, for Old Saxon *múth*. This transition cannot be explained by any phonetic laws, but must necessarily be ascribed to High German influence. As to the inflexional system, a similar influence seems to have introduced the High German terminations of the plural of verbs (*wi geven*, *gi gevet*, *se geven*, we, you, they give). The Old Saxon *-s* in the nominative plural has been dropped, as in High German. The following lines quoted from the municipal laws of the town of Hamburg (written 1270) may be taken as a fair specimen of 13th-century Low German:—"Dat nement syn erue verkopen schal, he ne bede id erst synen negesten. So we syn erue vorkopen wil, dat bynnen desser stad vnde bynnen dessem wicbelde belegen is, de schal id beden twen synen negesten vrunden, dar syn erue vp vallen mach, vnde wil it erer nen kopen, so mot he syn erue wol vorkopen deme de eme dar vmme allermest geuen wil." "That nobody shall sell his inheritance, unless he offer it first to his nearest (relations). Whosoever is willing to sell his inheritance, that is situated within this town and within these precincts, shall offer it to two his nearest friends (relations), to whom his inheritance may fall, and if neither of them is willing to buy it, he must (may) well sell his inheritance to him who is willing to give him most for it."

The differences of the main dialects of High German are not very striking during the first stage of this period. Alemannian is best characterized by its rigidly keeping its original vowel qualities, some of the modern Swiss dialects showing exactly the same system as about 1200. Swabian is easily discovered by its frequent use of *au* for *ā*, as in *gaun*, to go, for *gān*. A very important change of vowel qualities is found to have taken place, at a very early time, in the Bavarian dialect. While *ie*, *uo*, *üe* were preserved as in Alemannian, *ei*, *ou*, *öu* were changed into *œi* (or *ai*), *au*, *eu* (or *åu*), and three new diphthongs, *ei*, *ou*, *eu*, sprang up from the long vowels *ī*, *ū* *iu* (*ǖ*). In the Midland dialects again, *ei*, *ou*, and *ī*, *ū*, *ǖ* were kept, as in Alemannian (although *ü* is generally not distinguished from *u* in writing, as in most Midland manuscripts no special signs for the Umlaut vowels are used, except *e*), but *ie*, *uo*, *üe* were contracted to simple *ī*, *ū* (*ǖ*), differing from the old *ī*, *ū*, *iu* only in their open quality. The system of these changes may be illustrated by the following list:—

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| *Alemann.* | diep | guot | sūeze | mīn | būs | mūse | stein | boum | fröude |
| *Bavarian* | diep | guot | sūeze | mein | bous | meuse | stain | paum | freude |
| *Midland* | dīp | gūt | sūze | mīn | būs | mūse | stein | boum | freude |
| *Low Ger.* | dēf | gōd | sōte | mīn | hūs | mūse | stēn | bōm | froude |
| *English* | thief | good | sweet | mine | bouse | mice | stone | beam | (joy) |

As to the consonants, Alemannian and Bavarian still clung to the use of *ch* or *kch* for ordinary *k*, as *chomen*, for *komen*, to come. *P* initial for *b* is especially Bavarian, and was rather more frequent in the 14th and 15th centuries than before; *w* initial is often expressed by *b* in Bavarian manuscripts since the 13th century; thus we find *paideu*, both, for *beidiu* or *peidiu* in Alemannian, or *beide* in the Midland dialects, and *beip*, wife, or even *zbai*, two, for ordinary *wīp*, *zwei*; *k* initial for ordinary *g* went altogether out of use. In Midland orthography the two sounds of Old High German *z*, viz. *ts* and *ss*, were expressed by *cz* or *zc*, and *z* or *zz* respectively. The following specimens of the language of this period are taken from the *Schwabenspiegel*, or Swabian Law, for Alemannian (13th century); the *Spiegel deutscher Leute*, or Mirror of German People, for Bavarian (14th century); and a Midland version of the *Sachsenspiegel*, or Saxon Law [1]:—

*Schwabenspiegel.*

Dem pabest ist gesetzet in bescheidenlicher zit ze rihten vf einem bianchen pferde, vnd der cheiser sol dem pabest den stegreif haben, daz sich der satel nit entwinde. Daz bezeichent daz, swaz dem pabest widerste des er mit geistlichem gerihte niht betwingen mac, daz sol der cheiser vnd ander weitliche rihter betwingen mit der ebte.

*Sp. deutscher Leute.*

Dem babst ist gesetzet ze richten ze bescheidener zeit auf einen bianchem rosse, vnd der chaiser sol im den stegraif haben durch daz sich der satel icht entwende. Ditz ist dev beschaidenunge: swaz dem babest widerste, daz er mit geistleichem gerichte nicht betwingen müge, daz sol der chaiser vnd ander wertleich richter mit der æchte betwingen vnd das geistleich sol twingen mit dem panne.

*Sachsenspiegel.*

Deme babste ist ouch gesaczt zu ritene zu bescheidener zcit uf eime bianken pferde, und der keiser sal im den stegereif halden, durch daz der satel nicht enwinde. Daz ist die bezcechenunge: swaz deme babste widerste, des her nicht mid geistlichem gericbte getwingen mag, daz ez der keiser mit werltlichem gerichte twinge deme babste gehorsam zu wesene.

"To the pope it is set (ordained) that he shall judge at a certain time, (sitting) on a white horse, and the emperor shall hold the stirrup to the pope, that the saddle may not slide off. This means that whatsoever resists the pope, so that he cannot overcome it with spiritual censure, the emperor and other secular judges shall overcome with the proscription (and the spiritual [court] shall exercise discipline with the ban)."

In the 14th and 15th centuries the development of the dialects rapidly advanced. The greatest changes were those occurring in the vowel system. The new diphthongs *ei*, *ou*, *eu*, for older *ī*, *ū*, *iu*, which had originated in the south-eastern parts of the Bavarian district, gradually spread to the north and west; even some of the South Midland dialects, as Bohemian and Silesian, began to partake of this change, while the north Midland dialects and Alemannian remained unaltered. Short root syllables ending in a single consonant began to be lengthened in almost all dialects, as *gēben*, *nēmen*, for *gĕben*, *nĕmen*, to give, to take. Unaccented *e* was dropped in the southern dialects, especially in Bavarian, to the utmost extent possible. Such forms as *pschœch*, *gtorst*, *kœrt*, for *beschœhe*, happened (subj.), *getorste*, I durst, *gehœret*, heard (part.), began to be quite familiar. Even before a final *l* or nasal sound *e* was now and then dropped in Bavarian, as in *gebm* for *geben*, to give, *gegnt* for *gegende* country, which are exactly the forms still used in our time. Midland and Low German dialects continued to be much more conservative in all these respects. In the consonantal system we have to mention the loss of the *z* sound in all dialects, where it was a simple spirant (not *ts*); although the letter *z* was still often preserved in spelling, it was frequently confounded with *s* in the rhymes, a thing which never occurred in the earlier centuries. Alemannian is chiefly distinguished by its constant change of *sm*, *sn*, *sl*, *sw*, *sp*, *st* into *schm*, *schn*, *schl*, *schw*, *schp*, *scht*, as in *schmit*, smith, *schne*, snow, *schlahen*, to slay, *schwimmen*, to swim, *geschprochen*, spoken, *geischtlich*, "ghostly," spiritual. Late Bavarian favors such spellings as *chrankch*, *pekch*, for *krank*, *becke*. Spelling in general was much neglected, although it was not quite so bad as often in the 16th century, when

[1] The editions whence the extracts are taken are—for the *Schwabenspiegel*, that of Lassberg, Tübingen, 1840, p. 5; for the *Spiegel deutscher Leute*, that of J. Ficker, Innsbruck, 1859, p. 35; and for the *Sachsenspiegel*, that of Hildebrand, Leipsic, 1870, p. 3.

there was a strong tendency towards crowding as many letters into a word as possible.

While the 15th century was thus marked by great divergencies of the spoken dialects, important steps towards gaining a greater uniformity of literary speech were made in the same period by the invention of the art of printing, and by the development of certain *Kanzleisprachen*, or literary idioms of the imperial and other chanceries. There is no need to explain how the habit of reading books printed in dialects not familiar to the reader must have obliged the learned public of the time to acquire a certain amount of knowledge of dialects in general, and must have made them better aware of the peculiarities of their own idioms than was either necessary or possible at the time when manuscripts written expressly in the local dialects of the readers were the only means of conveying literary information. Besides, writers as well as printers must soon have found it profitable to publish their works in a language readily understood by readers in all parts of the country. The principal work, however, was done in Germany by the chanceries. Among these the imperial chancery naturally held the most prominent position; and, inasmuch as its public acts were addressed to readers of all dialects existing throughout the empire, it obviously had also the greatest interest in calling into existence a general idiom. In the 14th century no difference between the language of the imperial chancery and the local idioms of the particular emperors was yet visible.[1] The public Acts of Louis of Bavaria (1314–1347) were written in the Bavarian dialect. The succession of Charles IV. (1347–1378) was accompanied by the introduction of the Bohemian dialect into the imperial charters. This dialect, as was natural from its local position, was neither purely Southern nor purely Midland. *Ei, ou, eu* for *ī, ū, iu* were frequently adopted from the Southern dialects, but *ch* for *k* and *p* for *b* were generally rejected; unaccented vowels were preserved to about the same extent as in Midland German. In the reign of Wenceslaus of Bohemia (1378–1400) the same state of things was maintained; but in the charters of Rupert, the elector palatine (1400–1410), we find the Midland dialect of the Palatinate. Sigismund (1410–1437) reintroduced the Bohemian dialect, which by this time had, with the exception of a very short period, prevailed for nearly a hundred years in the imperial chancery. It was therefore but natural that Duke Frederick of Austria should exchange the Austrian dialect of his ducal chancery (which abounded with *kch, kh, kg* for *k*, and *p* for *b*) for the Bohemian chancery dialect of his predecessors, when he succeeded to the imperial throne (1470–1493). His example was followed by Maximilian (1493–1519), but only so far as public Acts were concerned. In charters destined for local Austrian use as well as in his private correspondence he always kept his vernacular Austrian dialect, showing thus that no change of the spoken idioms had been caused as yet by the introduction of the new artificial language. In the same manner and at the same time the Midland dialect of the electoral chancery of Saxony came to be better adapted for general use by the adoption of the Southern *ei, ou, eu* for *ī, ū, iu*, and the abolition of several prominent Midland peculiarities.

*Modern High German.*—In the preceding paragraph we have tried to give a short sketch of the origin of literary Modern High German; and it is this very idiom of the imperial and Saxon chanceries that Luther made afterwards popular by his translation of the Bible and his numerous other writings. We may quote his own words in confirmation:—

"Ich habe keine gewisse, sonderliche, eigne sprache im deutschen, sondern brauche der gemeinen deutschen sprache, das mich beide Ober- und Neiderländer verstehen mögen. Ich rede nach der sechsischen cantzlei, welcher nachfolgen alle fürsten vnd könige in Deutschland; Alle reichsstedte, fürstenhöfe schreiben nach der sechsischen vnd vnsers fürsten cantzeley. Darumb ists auch die gemeinste deutsche sprache. Kaiser Maximilian vnd churfürst Friderich, hertzog von Sachsen, haben im römischen reiche die deutschen sprachen also in *eine* gewisse sprach zusammengezogen."[2]

Luther's language, again, was soon acknowledged by German grammarians, as Sebastian Franck (1531) and Johannes Clajus (1578), and was accordingly imitated, as the best pattern of High German. It is true that in the 16th century many writers, especially in Switzerland and Lower Germany, still clung with great pertinacity to their native dialects. But about 1600 Luther's language was fully established as the only idiom of literary intercourse throughout Germany.[3] The changes the language has undergone since Luther's time mostly concern the inflexional system. In the strong verbs the differences between the singular and plural and the indicative and subjunctive of the past have been levelled in the course of time; thus, *ich fand, wir fanden*, I, we found, subj. *ich fände*, or *ich schnitt, wir schnitten*, I, we cut, for *ich fand, wir funden, ich fünde*, or *ich schneit, wir schnitten*. At present the verb *werden*, to become, is the only specimen left of the old regular inflexion:—*ich ward, wir wurden, ich würde*; but even here a new irregular form, *ich wurde*, has come into use and almost superseded the more archaic *ich ward*, which is now chiefly confined to poetry. Many other vowel changes have taken place besides, as in *webe, wob, gewoben*, weave, wove, woven, for Middle High German *wibe, wap, geweben*, so that the old system of "Ablaut," or vowel change in the root syllables of the strong verbs has often become quite indistinct. A great number of verbs have passed from the strong inflexion to the weak, and *vice versa*. The declension of substantives has also been greatly altered. Umlaut is now regularly used as a plural sign with most monosyllabic and many dissyllabic masculine words, as in *baum, bäume*, or *nagel, nägel*, for Middle High German *boum, boume*, and *nagel, nagele*; originally it was confined to a much smaller number of words (*i*-stems, as *gast, gäste*, Middle High German *gast, geste*). Other masculine words have adopted the plural *-er*, together with Umlaut of the root syllables, from the neuter declension, as *mann, männer, geist, geister*, besides frequent exchanges between the strong and weak declensions, which cannot be specified here. The strong and the weak declension of feminine words originally ending in *e* have been melted together, one form (ending in *e* or a consonant) being used for all singular, and one (ending in *en* or *n* after a consonant) for all plural cases, as *gabe, gaben, zahl, zahlen, zunge, zungen*, for Middle High German *gābe, gābe*, gen. and dat. *gāben; zal, zal*, gen. and dat. *zaln; zunge*, gen. dat. and acc. *zungen*, pl. *zungen* throughout. As to phonology, no change of vowel quality is noticeable in literary German. Modern High German still has the Midland sounds *ī* (often spelt *ie*), *ū, ǖ*, for Southern *ie, uo, üe*, as well as the Bavarian diphthongs *ei, au, eu* (*äu*), for the older sounds *ī, ū, iu*, the latter not being distinguished either in spelling or in educated pronunciation from the older diphthongs, *ei, ou, öu*. We have thus *zwei, drei, baum, haus, freude, häuser, leute*, for Middle High German *zwei, drī, boum, hūs, vröude, hiuser, liute*. Change of vowel quantity is the most prominent phonetic feature of Modern High German when compared with the earlier stages of the language. All root-syllables ending formerly in a short vowel followed by a simple consonant have now become long, either by lengthening the vowel or by doubling the consonant, thus *tāg, tāge, sāl, bōte*, or *gott, gottes, blatt, blätter*, for Middle High German *tăg* (or *tăc*), *tăge, săl, bŏte, gŏt, gŏtes, blăt, blĕter*. The rules for dropping unaccented vowels have often been changed accordingly. It must not be forgotten, however, that all these rules are only applicable to the literary idiom; the dialects, and even those of the educated people, often differ very materially from the rules laid down above. There is, indeed, no such thing as a generally recognized standard pronunciation of German, except perhaps on the stage, which no doubt has exercised and still exercises a certain influence on the current opinions as to how one ought to pronounce, but has not been powerful enough to abolish all dialectal peculiarities in the case of even the highest classes. Only a very few general rules can be given. Englishmen will do well to pronounce the vowels as in Italian: *ü* and *ö* are rounded or labialized *i* and *e* sounds, formed by pouting the lips while trying to pronounce *i* or *e*. Long vowels are always pronounced simple, never as diphthongs (which is frequently the case in English, especially with *a* and *o*). Unaccented *e* is invariably dropped in the terminations *el, en*, the real pronunciation of such words as *handel, bitten, lippen, haben, nehmen* being *handl, bittn, lippn* or *lippm, hābn* or *hābm, nēm* (with a lengthened *m*).[4] Among the pecu-

[1] The particulars which follow are chiefly taken from an able sketch by Dr. E. Wülcker, *Die Entstehung der kursächsischen Kanzleisprache*. See *Zeitschrift des Vereins für thüringische, Geschichte*, ix. p. 349.

[2] *Tischreden*, ch. 69. Dr. Wülcker assigns these words to the year 1545.

[3] For fuller particulars readers are referred to H. Rückert, *Geschichte der neuhochdeutschen Schriftsprache*, 2 vols., Leipsic, 1875.

[4] Foreigners are easily detected by their generally inserting a real vowel-sound before the *l, n*.

liarities of the consonantal system we may mention the sound of *ch* (in two distinct varieties as in *ach* and *ich*), the *z*, which is a combination of *t* and *s*, and the *r*, which ought to be trilled with the tip of the tongue, but is often pronounced as a uvular or guttural sound. *S* initial is generally sounded like the English *z*, in stage pronunciation, but not usually elsewhere; *st* and *sp* initial are never pronounced on the stage like English *st* or *sp*, but are always *sht*, *shp*, as in *stein*, *spiel*, pronounced (to use English spelling) as *shtine*, *shpeel*. The English *w* ought to be avoided. The German *w* sound is more like English *v*, but somewhat softer; in Midland pronunciation a sound intermediate between English *w* and *v* takes its place. German *v* is simply *f*.[1]

The varieties of the German dialects of the present are too numerous to be described here. It may suffice to state that the old divisions of Low German, Midland, and Upper German dialects are still applicable. Among the first, the Western or Westphalian dialects are distinctly marked by the pronunciation of *g* initial as a *gh*, or voiced *ch* (sometimes even voiceless), and the use of numerous diphthongs, both long and short, instead of simple vowels. The principal sub-divisions of Midland German are the Lower Rhenish or Middle Frankish dialect (including the German dialects of Transylvania), South-Western and Eastern or High Frankish, Hessian, Thuringian, Saxon, and Silesian. Alemannian is divided into the three main groups of Swabian, Alsatian, and Swiss, while Bavarian is constituted by several sub-dialects spoken in Bavaria and Austria. The study of these dialects has been carried on in Germany for a considerable time,[2] but not always very successfully, especially so far as phonology is concerned; for many observers, while well-trained in all the disciplines of the older school of philology, have been totally ignorant of the simplest laws of phonetics. It is only within the last few years that the value of phonetic studies (although they began in German researches) has been duly recognized in the country of their origin, and dialectology has not hitherto gained much by the more theoretical study of general phonetics. Some excellent beginnings indeed have been made, among which Dr. Winteler's book on his native Swiss dialect holds by far the foremost rank;[3] but it is probable that a long time must yet elapse before Germany can possess so well trained and independent a school of phonetists as that which already exists in England headed by Mr. A. Melville Bell and Mr. Alexander J. Ellis. Not till then, however, can a real history of the German language be written. (E. SI.)

## PART IV.—LITERATURE.

Ancient poetry.

There is a deep vein of poetry in the Teutonic nature, and it appears to have revealed itself in the earliest ages. According to Tacitus, the Germans of his time had ancient songs relating to the god Tuisco, his son Mannus, and the three forefathers of the Teutonic race. They had also poems in honor of Arminius, the original subject of which was probably the god Irmin, whose pillar Charles the Great overthrew long afterwards in his first campaign against the Saxons. A song called "barditus," celebrating the greatness of the war-god whom Tacitus calls Hercules, was sung or chanted by the freemen as they advanced to battle. The name "barditus" led some ingenious writers of the 18th century to speculate respecting an order of bards among the ancient Germans; but there is no evidence that any such order existed. "Barditus" meant in the first instance a shield, and was transferred to the song because, while the singing went on, the shield was held to the mouth to make the sound more terrible. It is the opinion of many critics that the stories of "Reynard the Fox" and "Isengrim the Wolf" may be traced back to these remote times. If so, the probability is that they were brought by the Teutons from Asia, and were originally common to the Aryan family. There is every reason to believe that some elements of the *Nibelungenlied* belong to the prehistoric age. The legend of Siegfried has all the marks of extreme antiquity, and it seems to have had at first a purely mythological character. Of the rhythm in which these primitive conceptions were embodied we have no certain knowledge; but as the most ancient poems which have been preserved are in alliterative verse, it is reasonable to assume that this had grown up long before writing came into use.

Opposition of the clergy.

I. *The Early Middle Age.*—When the German tribes began to accept Christianity the clergy everywhere opposed the native poetry, and strove to replace its rude conceptions by the milder images of the gospel. Among the Goths of the 4th century Bishop Ulfilas took the most effectual means of achieving his purpose by preparing a clear, faithful, and simple rendering of the Scriptures,—a translation which has been of inestimable value in the scientific study of the Teutonic languages. No clergyman of like genius arose in Germany itself; but there, too, pagan compositions were steadily discouraged. Charles the Great was the first to check this hostile movement. He showed his love of his native speech, not only by beginning to put together a German grammar, but by issuing orders for a collection of old German poetry. Louis the Pious had little sympathy with the taste of his father, but he could not efface the impression produced by the great emperor. Many of the clergy ceased to dislike that which so mighty a friend of the church had approved, and in some monasteries there were ardent collectors of ancient epic fragments and ballads.

Pagan literature.

These treasures of Old High and Low German literature are nearly all lost, but from the small portions which have come down to us, and from hints in Latin chronicles, we can at least make out the themes with which many of them dealt. Ermanrick, or Ermanaricus, the famous Gothic king of the 4th century, was the subject of a large number of poetical legends. Siegfried continued to be a great epic hero, and from about the 7th century he appears to have been no longer treated as superhuman. The legend of the overthrow of the Burgundian king, Gundicarius or Günther, by Attila assumed many forms, and was at a later time connected with the story of Siegfried. Around the name of Theodoric the East Goth, as Dieterich, several legends soon grouped themselves; and from about the 9th century he was associated with Attila, with whom in history he had nothing to do. Unfortunately, the fragments which have been preserved—all of which are alliterative—do not treat of these supreme heroes; their subjects are of subordinate importance and interest. The *Hildebrandslied*, which was written from traditional narratives early in the 9th century, and is in a mixed dialect, introduces us to a follower of Dieterich. Hildebrand, returning from the wars carried on by his lord, is compelled to fight his own son; but we are left in uncertainty whether father or son is conqueror. The *Ludwigslied* is a ballad of the latter part of the 9th century, written in honor of a victory gained over the Northmen by Louis III., the West-Frankish king. The author was probably a monk who had been a favorite at the court of Charles the Bald. There is also an Old High German ballad celebrating the reconciliation of Otto I. with his brother Henry; and similar ballads are known to have kept up the fame of Duke Ernest of Swabia, who rebelled against Conrad II., and of many other popular heroes. Walter of Aquitania, who flies with his bride from the court of Attila, and at Worms fights King Günther and his warriors, is the hero of a Latin poem of the 10th century, written by a monk of St. Gall, whose materials were evidently taken from a more vigorous German original. The *Merseburger Gedichte*, two songs of enchantment, were written in the 10th century, but must have come down from a much more remote period. They are chiefly interesting for the light they throw upon the religious beliefs and customs of ancient Germany.

Minstrels.

The old ballads, which were intended to be sung as well as recited, were handed down from generation to generation and necessarily underwent many changes. They were preserved from an early period in the memory of the people by professional minstrels, who were held in considerable honor in the time of Charles the Great, but were afterwards rather tolerated than encouraged by the higher classes. Many of them were blind men, and in their solitary wanderings the ancient stories must often have assumed in their minds new

[1] For more accurate descriptions of the German sounds see E. Sievers, *Grundzüge der Lautphysiologie*, Leipsic, 1876.

[2] A very full list of books referring to German dialectology has been given by C. H. Herrmann, *Bibliotheca Germanica*, Halle, 1878, p. 67 *sqq*.

[3] J. Winteler, *Die Kerenzer Mundart des Kantons Glarus*, Leipsic, 1876. This is indeed the only work that can be justly compared with Dr. J. A. H. Murray's *Dialect of the Southern Counties of Scotland*, published in 1873.

shapes. They usually accompanied their singing with the zither or the harp.

Religious poetry.

Of the works with which the church sought to counteract pagan influences very few remain. The most important is *Heliand*, a Low German poem in alliterative verse said to have been written by a Saxon at the request of Louis the Pious. It is a narrative of the life of Christ, and follows closely the Four Gospels, whose separate accounts it attempts to harmonize. The author has considerable force and freedom of expression, and seems to have been so absorbed in the grandeur of his theme as to have deliberately rejected rhetorical ornament. The so-called *Krist* of Otfrid, a High German poet, who dedicated his work to Louis the German, has the same subject, but is not nearly so effective. It is the first rhymed German poem, and the necessities of rhyme often compel Otfrid to fill out his line with words and phrases which obscure his meaning. His lyrical passages are too didactic to rank as genuine poetry. The fragment of *Muspilli*, a Bavarian poem of the 9th century on the Last Judgment, indicates power of a much higher order. Its form is alliterative; and reminiscences of paganism are strangely mingled with its Christian ideas.

Monastic learning.

During the reigns of Charles the Great and Louis the Pious secular learning was zealously cultivated in the monasteries of Germany as well as in those of other portions of the Frankish empire. The school established by Hrabanus Maurus in the famous abbey of Fulda vied with that of Tours, where Hrabanus had been a pupil of Alcuin, in the excellence of its teaching. In the wars with the Northmen, with the Magyars, and with the Slavs under the later Carolingian kings, many of the ecclesiastical institutions were destroyed; but they sprang up again under the protection of Henry I. From the time of his son Otto I. the Germans stood in direct relation with Italy; the marriage of Otto II. with the princess Theophano brought them into connection with the learning and refinement of the Byzantine court; and Gerbert, the friend of Otto III., afterwards Pope Silvester II., introduced them to some of the achievements of Arabian science. These influences quickened the energies of enlightened churchmen, and originated an intellectual movement which to some extent continued during the vigorous reigns of the first two Franconian sovereigns, Conrad II. and Henry III. The chief subject of study was the scholastic philosophy, to which, however, in its earlier stages, Germany made no supremely important contribution. The Neo-Platonic tendencies of Scotus Erigena were opposed by Hrabanus Maurus, who remained loyal to Aristotle and Boetius; and his example was generally followed, not only by his successors in Fulda, but by the members of all other German schools. The school of St. Gall was exceptionally active, and one of the monks, Notker Labeo, who died in 1022, wrote some original philosophical books, and translated into German the *De Consolatione* of Boetius and two of Aristotle's works. In pure literature very little was done; but there are several well-written Latin histories belonging to the 11th century. The best thought of the age was manifested in its Romanesque architecture, and in the then subordinate arts of painting, sculpture, and music.

Hohenstaufen period.

II. *The Age of Chivalry.*—The reign of Henry IV., during which the struggle between the empire and the papacy began, had a disastrous effect on the national culture; and the evil was not remedied under the disturbed rule of his two immediate successors. But under the Hohenstaufen dynasty, during the period of Middle High German, the country passed through one of the greatest epochs of its literature. The more learned of the clergy interested themselves deeply in the development of scholasticism through the nominalists and the realists; and in the 13th century Albertus Magnus, a native of Swabia, produced the first systematic exposition of Aristotle, in the full light of Arabian research. It was, however, in poetry that Germany achieved the highest distinction; and her most important poets were members of the knightly class, which at this time rose to its utmost power and fame. There were many reasons why the members of this class became sensitive to the higher influences of the imagination. In the first place, they had the elevating consciousness of a life shared with a vast community which set before itself the loftiest aims. Historians sometimes take a malicious pleasure in contrasting the mean performance of many knights with their high vows; but these vows at any rate introduced into the life of rough nobles an ideal element, and inclined them to take interest in the gentler and nobler aspects of existence. In the Italian wars of Frederick Barbarossa the German knights saw more than they had ever before done of Southern civilization, and their minds were continually stimulated by the varying fortunes of their adventurous emperor. Of still greater importance was the influence of the crusades, in which the Germans first took an active part under Frederick's predecessor, Conrad III. The crusaders had a remote and unselfish aim, connected with all that was most sacred and most tender in their religious ideas; and this alone would have created a sentiment favorable to poetic aspiration. But, besides this, the far-off Eastern lands, with their strange peoples and mystical associations, awoke dreams which could not have other than harmonious utterance, and on the return of the warriors they stirred the fancy of their friends with reports of a new and greater world. While the crusades lasted, the knights were forced into intimate acquaintance with the clergy, whose refined culture inevitably to some extent softened their rudeness; they also formed friendships with representatives of French chivalry. In France the works of the troubadours and the trouvères formed one of the most prominent elements of the national life, and the French nobles did not forget in Palestine the songs and romances of their home. The better minds in the German armies caught the inspiration, and longed to distinguish themselves by like achievements. And their desire was deepened when, by the acquisition of the Free County of Burgundy, Frederick Barbarossa opened a new pathway by which intellectual influences might pass from the western to the eastern bank of the Rhine.

The poetic impulse which thus entered Germany affected a wide circle; the highest princes as well as the humblest knights felt its power. Even the emperor Henry VI. himself is said to have been moved by the prevailing feeling, and to have composed verses. At the imperial and princely courts poets were encouraged to give expression to their genius; and the ladies whose beauty and virtues they delighted to praise stimulated their endeavors by marked appreciation. Thus the national imagination found in the whole temper of the age an atmosphere well adapted to the blooming of its first spring-time.

Poetical romances.

The most characteristic outcome of this active era is the series of poetical romances produced in the 12th and 13th centuries. The German poets might have found magnificent material in their old, native legends; but for the most part they preferred subjects which had already been artistically wrought by the trouvères, whose methods and style they also closely imitated. Among the themes they selected may be mentioned the legends of Alexander the Great, of Charles the Great and his paladins, of Arthur and the knights of the Round Table, with the allied legend of the Holy Grail. The fortunes of Tristram and Iseult also exercised a powerful charm over many minds. These and all other chosen subjects were treated wholly in the spirit of chivalry. The poets of the Middle Age had no idea of being true to the characteristics of a particular epoch; their own time was the only one they attempted to understand. Ancient heroes became in their hands mediæval knights; men who had died long before the rise of Christianity were transformed into devoted servants of the Church. And in every romance the supreme aim was to present an idealized picture of the virtues of knighthood.

Romance writers.

One of those who prepared the way for the chief romance-writers was Conrad, a priest in the service of Henry the Proud, who, before 1139, composed the *Rolandslied*, setting forth, in imitation of the French *Chanson de Roland*, the overthrow of Roland, the favorite paladin of Charles the Great, in the pass of Roncesvalles. He was followed by another priest, Lamprecht, who, also working upon a French original, relates in the *Alexanderlied* the deeds of the Macedonian hero. Greater than either of these was Heinrich von Veldeke, the first of the poets who may claim to rank as German trouvères. His great work was the *Eneit*, written between 1175 and 1190. It is not only in armor and in dress that Virgil's characters are here changed; in thought and feeling they are recreated. The language of the poem is so carefully chosen, and the incidents are narrated with so much spirit, that it is still possible to understand the immense popularity it once enjoyed. Hartmann von Aue, in *Der Arme Heinrich*

Hartmann von Aue.

and other poems, selected themes that are extremely repulsive to modern feeling; but he was endowed with genuinely plastic force, and interests us by touching certain mystical aspects of mediæval sentiment. The master in whom these aspects were most fully represented was Wolfram von Eschenbach, a member of a noble family of Franconia, who was born during the reign of Frederick Barbarossa and died during that of his grandson, Frederick II. He was one of a group of poets who established themselves at the Wartburg, the court of the brilliant landgrave Hermann of Thuringia; and his chief poem, *Parzival*, was composed there towards the end of the 12th century. Germany did not produce during the Middle Ages a more truly poetic mind, and it is curious to observe how exactly he anticipated some of the qualities for which she long afterwards became famous. He has all the dreaminess, the sentiment, the passion for the ideal, which are, or rather at one time were, her most attractive characteristics. The hero, trained by his mother amid circumstances of idyllic simplicity, suddenly passes into a world of movement and adventure, and he is brought by accident to the gorgeous palace of the Holy Grail, of whose kingdom he ultimately becomes lord. The object of the poem is evidently to depict the strivings of a restless but noble spirit, dissatisfied with passing pleasure, having always before it a high and spotless aim. It is difficult for modern readers to detect the spiritual significance of many of the scenes; the poet seems to escape from us into a far-off region, whence his words reach us rather as dim echoes than as clear, ringing sounds. And some of the descriptions are in themselves tedious and superfluous, while advance from one stage of the tale to another apparently proceeds according to the arbitrary whim of the moment. Nevertheless, the character of Parzival is a true conception of genius, and enables us to understand, better than any other imaginative creation of mediæval Germany, that discontent with life as it is, that sense of being haunted by visions of spiritual loveliness, which, throughout the Middle Ages, existed side by side with unrestrained delight in the outward world.

Wolfram von Eschenbach.

Gottfried of Strasburg.

A complete, almost a dramatic contrast to Wolfram von Eschenbach is found in Gottfried of Strasburg, the greatest of his literary contemporaries. These two men are representatives of a distinction which incessantly recurs,—that between the poet who fashions spirits of a finer mould than those we actually know, and the poet who contents himself with penetrating into the innermost recesses of existing character. Gottfried's theme is Tristram and Iseult; and the charming tale, which unfortunately he did not live to carry to the end, was perhaps never more beautifully told. There are no mystic longings in the men and women he presents to us: they love the earth and the sky, with their gorgeous colors, graceful forms, and happy sounds; they care not to inquire what may lie behind these, or whether in the scheme of things there is a place for moral law. Few poets have set forth so powerfully the fascination of youthful passion. In his glowing pictures we find no shadowy figures like those of Wolfram, with step so light that they appear to be the figures of a dream; his images are clear, sharply cut, like those of the world from which they are taken. And although psychological analysis was unknown to him, the actions of his characters display keen insight into the secrets of human hearts when entangled in the most confused meshes.

Mediæval romance bore its richest fruit in the works of these two great poets; and most of their successors imitated one or other of them. Those who followed in Gottfried's steps came nearest to a happy result, for Wolfram was one of those lonely and daring spirits in whose remote path it is given to few to tread without stumbling. The best known of Gottfried's imitators was Conrad von Würzburg, who wrote on the Trojan war and many other subjects, and is considered one of the most artistic of mediæval writers. Towards the end of the 13th century the movement showed signs of exhaustion, and romances began to make way for rough popular tales and rhymed chronicles.

Fortunately the poets of the age of chivalry did not all occupy themselves with the subjects of French romances. A few, whose names we do not know, turned towards the rich material in the metrical legends of their native lands. Of these poets, the most important was he who collected and put into shape the ancient ballads which make up the *Nibelungenlied*. How far he modified them we cannot tell. In the form in which we possess them, they probably owe something of their force to his genius; but he needed rather to arrange and to curtail than to invent, and although a genuine poet, he was not at all times competent for his task. The work includes the legends of Siegfried, of Gundicarius, or Günther, king of Burgundy, of Dieterich, and of Attila; and the motives which bind them into a whole are the love and revenge of Kriemhild, the sister of Günther and Siegfried's wife. She excites the envy of Brunhild, the Burgundian queen, whose friend Hagen, one of Günther's followers, discovers the vulnerable point in Siegfried's enchanted body, treacherously slays him, and buries in the Rhine the treasure he has long before conquered from the race of the Nibelungen. There is then a pause of thirteen years, after which Kriemhild, the better to effect her fatal purpose, marries Attila, king of the Huns. Thirteen years having again passed, her thirst for vengeance is satiated by the slaying of the whole Burgundian court. The Germans justly regard this great epic as one of the most precious gems of their literature. It has little of the grace of courtly poetry; its characters are without subtlety or refinement; we are throughout in the presence of vast elemental forces. But these forces are rendered with extraordinary vividness of imagination, and with a profound feeling for what is sublime and awful in human destiny. The narrative begins with epic calmness, but swells into a torrent and dashes vehemently forward, when the injured queen makes a fearful return for her wrongs, and is herself swept away by the tragic powers she has called to her service. In the management of the story there are occasional traces of mediævalism; but its spirit is that of a more primitive time, when the German tribes were breaking into the Roman empire, when passions were untamed by Christian influence, and when the necessities of a wandering and aggressive life knit closely the bonds that united the chief to his followers. Deliberate villainy hardly appears in the poem; the most savage actions spring either from the unrestricted play of natural feeling, or from unquestioning fidelity to an acknowledged superior. Here and there we come upon touches which indicate that the poet who preserved the ancient legends was not incapable of appreciating finer effects than those at which he generally aims. The sketch of the hospitable and chivalrous Rüdiger, who receives the Burgundians on their way to the court of Attila, and afterwards dies while unwillingly fighting them in obedience to his queen's command, is not surpassed in the most artistic of the mediæval romances.

Nibelungenlied.

*Gudrun* is another epic in which a poet of this period gave form to several old legends. They had for centuries been current along the coasts of Friesland and Scandinavia, and the society they represent is essentially the same as that of the *Nibelungenlied*,—a society in which the men are rude, warlike, and loyal, the women independent and faithful. Although full of serious episodes, *Gudrun* is as happy in its ending as the greater poem is tragic; and we feel throughout that the beautiful Princess Gudrun of Seeland, whom the Northmen have carried from her home, and on whom the cruel Queen Gerlind heaps indignities, will at last be restored to King Herwig, her brave and passionate lover. The characters stand out clearly in their rough vigor; and several happy strokes call up a vision of the bleak coasts and changeful northern sea which are the scenes of their adventures.

Gudrun.

In the 15th century a German writer brought together in a single volume which he called the *Heldenbuch*—the "Book of Heroes"—a number of old legendary tales that must have been frequently on the lips of the people and of the wandering minstrels, while the knightly poets were singing of Tristram or of Arthur. This work, which was partly written by Kaspar von der Rhön, will not compare in imaginative force with its more famous rivals. The most powerful of the stories is probably the "Grosser Rosengarten," in which a monk, Ilsan, displays a very unclerical, but truly Teutonic, passion for war.

Heldenbuch.

The age of chivalry was remarkable not only for its romances and epics but for its lyrics. All the leading writers of the time exercised themselves in lyrical poetry, and it was laboriously cultivated by multitudes who did not feel equal to the task of a prolonged effort. Among those who gained more or less

Minnesänger

distinction may be named Heinrich von Morungen, Reinmar der Alte, and Gottfried von Neifen. The poets of this class were known as Minnesänger, because their favorite theme was Minne or love. They began by imitating the troubadours, whose metres they often reproduced when not penetrated by the emotion which originally found in these forms a genuine expression. At a later stage it was considered a point of honor for each poet to invent a stanza of his own, whether or not those already existing were appropriate to his feeling. Thus many of the minne songs produce an impression of unreality and coldness, seeming at best to be but clever pieces of handiwork. But when the utmost deduction has been made, it is surprising how much of what was achieved by these ardent writers still appeals to us. The best among them strike notes which respond in every age to a master's touch; and they do it with a fine sense of beauty, a trained instinct for the appropriateness of words, and an evident delight both in simple and in subtle melody.

Perhaps no group of writers has ever had a deeper undertone of sadness than is to be detected in the greatest of the minnesänger. They had a vivid consciousness of the evanescence of human pleasure, an abiding feeling that corruption lurks behind the gayest forms and brightest colors. But they caught with proportional eagerness the passing rapture, letting no drop escape from the cup that would soon fall from their grasp. This intensity of feeling is reproduced in their lays, yet it was purified and generalized as it passed from the fleeting reality to the permanent realm of art. Their treatment of love, although sometimes, according to modern ideas, extravagant and fantastic, often displays genuine elevation of sentiment. They sing also in impassioned strains the loyalty of the vassal to his lord, the devotion of the Christian to his church. If they do not exhibit the soaring spiritual ambition of Wolfram's *Parzival*, they have a kind of pathetic memory of a lost paradise, a vague longing, by some distant difficult service, in battle with the infidel, to attain to a world in which the discords of the present life may be forgotten or harmonized. And behind all their images is the background of nature, whose loveliness they do not the less appreciate because they refrain from elaborately describing it. To the dwellers in dreary towers winter had often a cheerless and melancholy aspect; but this made all the more enchanting the new life of spring. It is in hailing the returning warmth and color of the young season that the minnesänger attain their happiest triumphs.

Walther von der Vogelweide.

Of all the minnesänger the first place belongs without question to Walther von der Vogelweide, probably of Tyrol, whom Gottfried of Strasburg praises as heartily as he slyly depreciates Wolfram von Eschenbach. Walther lived some time at the Wartburg, and was the friend of King Philip and Frederick II.; he died on a little estate which the latter gave him in fief. Other Minnesänger lavished praise on generous princes; Walther was of a more manly character, and seems always to have maintained an independent bearing. Besides the usual themes of the lyrical poetry of his time, he wrote with enthusiasm of his native land; he also frequently alludes to the strife between the spiritual and secular powers, and sternly rebukes the ambition of the papacy. Beyond all his rivals he gives us the impression of writing with ease and delight. The structure of his stanzas does not hamper the movement of his feeling; it appears to provide the conditions of perfect freedom. Such a lyric as his *Unter der Linden an der Heide*, with its musical refrain *Tandaradei*, although a master-piece of art, is exquisite in its childlike simplicity; it has the unaffected grace of a flower, the spontaneity of a bird's song.

Ulrich von Lichtenstein.

As the expression of all that was fantastic and ridiculous in the age of chivalry, must be mentioned the *Frauendienst* of Ulrich von Lichtenstein, a work which was written about the middle of the 13th century, and had a certain popularity in its time. It is an autobiography, with a number of lyrics interwoven to give variety and animation to the narrative. The solemn gravity with which the author relates the amazing tasks imposed upon him by his mistress shows how easily the worship of womanhood degenerated into almost incredible childishness. Ulrich is sometimes compared to Don Quixote, but this is to do extreme injustice to Cervantes's hero. Amid all his illusions the fictitious knight maintains a certain pathetic dignity; the knight of reality passes from absurdity to absurdity without a touch of idealism to redeem his folly. And his lyrics are the tasteless manufacture of a thoroughly prosaic spirit.

Didactic poets.

Several of the minnesänger, Walther von der Vogelweide especially, display at times a strongly didactic tendency. From the beginning of the period this tendency was developed by writers who took little interest in poetry for its own sake, and it became more and more prominent as the purely lyrical impulse passed away. The didactic poet, however significant his labors may be to his contemporaries, has necessarily the stamp of commonplace for posterity; and the gnomic writers of the 13th century form no exception to this rule. But several of them have at least the interest that attaches to sincerity and earnestness. There is genuine enthusiasm for pure morality in the *Welsche Gast* of Thomasin Zerklar; and the *Bescheidenheit* of Freidank expresses so high a conception of duty, and expresses it so well, that the work was ascribed to Walther himself. Reinmar von Zweter and Heinrich Frauenlob came a little later, and they were followed by Hugo von Trimberg, whose *Renner* sets forth unimpeachable lessons in homely and satirical verses. A higher tone is perceptible in *Der Winsbecke*, a collection of sayings in which we find an echo of the reverence for noble women that marked the epoch at its dawn. Among didactic writings must be classed the well-known *Der Krieg auf der Wartburg* ("The Contest at the Wartburg"). It includes the verses supposed to have been sung at a tournament of poets attended by Heinrich von Ofterdingen, Walther von der Vogelweide, and Wolfram von Eschenbach.

Beginnings of prose.

As Latin continued to be the speech of scholars, and the passion for metrical expression pervaded the higher classes, there was not much scope for the growth of prose. Nevertheless, it is in this age that we find the first serious attempts to secure for German prose a place in the national literature. The *Sachsenspiegel* and the *Schwabenspiegel*, two great collections of local laws, although of a scientific character, and mainly interesting because of their social importance, had considerable influence in encouraging the respect of the Germans for their own language. The preachers, however, were the principal founders of prose style. Preaching became about the middle of the 13th century an agency of great power in the life of Germany. A number of the clergy, dissatisfied with the technicalities of scholasticism, and with the mere forms under which spiritual aspiration was often crushed, strove to attain to a fresh vision of religious truth, and to kindle their own enthusiasm in the minds of others. Of this generous band the most popular was Brother Berthold, a Franciscan monk, a man of a noble and commanding temper, and an orator of the highest rank. Love for the poor was his dominant motive, and he sometimes expressed it in language a modern socialist might envy. Having something of the imaginative glow of the minnesänger, he gave such color to his abstract teaching as made it at once intelligible and attractive. Of a less poetical nature than Berthold, Master Eckhart, the next early master of religious prose, was more deeply philosophical. Although familiar with the scholastic systems, he broke away from their method, and became the founder of the mystical school which was one of the most potent factors in preparing the way for the Reformation. Eckhart's reasonings are sometimes hard to follow, but he is not a confused thinker; his obscurity arises rather from the nature of his themes than from his mode of handling them. He occasionally touches profound depths in the spiritual nature of man, and it is refreshing to pass from the formal hair-splitting of the scholastic philosophers to the large conceptions of a mind which obeys its own laws and is evidently in direct contact with the problems it seeks to solve.

III. *The Later Middle Age.*—After the fall of the Hohenstaufen dynasty the age of chivalry in Germany virtually came to an end. The breaking up of the old duchies set free a large number of petty nobles from their allegiance to mediate lords; and as there was no longer a strong central authority, either to hold them in check or to provide them with such outlets for their energy as they had found in the crusades and in the imperial expeditions into Italy, nearly the whole class sank from the high level to which it had temporarily risen. Many knights became mere robbers, and thought them-

Decline of chivalry.

selves honorably employed in taking part in the innumerable little wars which shattered the prosperity of the nation. Men of this kind were not very likely to inherit the free and poetic spirit of Walther von der Vogelweide. In the course of the 14th and 15th centuries attempts were still made by Wolkenstein, Muskatblüt, and other writers to imitate his style; but in their hands the lyre of the minnesänger gave forth only feeble or discordant notes. For a long time the princes were no more inclined to literature than the nobles; they were too much occupied with mutual jealousies, and with incessant attempts to shake themselves free of the crown, to give heed to anything so removed from practical interests as poetry.

Literature in the cities.

It so happened that during this period the cities rose to a position of higher importance than they had ever before occupied. There was a while when it even seemed possible that by their leagues, and by alliance with those emperors who had insight enough to recognize their strength, they might become the preponderating element in the state. Driven from the castles of the princes and the towers of the nobles, literature took refuge in these young and growing centres of a vigorous life. Not one or two here and there, but multitudes of honest citizens, became possessed by the desire to distinguish themselves in the arts in which they had been so much surpassed by the nobles of a previous generation. Unfortunately, they had no literary training; they were not familiar with any great models; few of them had leisure for the cultivation of style; and the character of their daily employments was not such as to kindle thoughts that demand poetic utterance. At that time every trade had its guild; and they now formed guilds of poetry, the task of whose members was in intervals of leisure to produce songs according to a body of strict rules, as in hours of business they produced shoes or loaves. The rules were called the "Tabulatur," and the rank of each member was determined by his skill in applying them. The lowest stage was that of a man who had simply been received into the guild; the highest, that of a master, who had invented a new melody. Between these were the scholar, the friend of the school, the singer, and the poet. Literature produced under such conditions could not have much vitality. It amused the versifiers, and developed a certain keenness in the detection of outward faults; but the spirit of poetry was wanting, and there is hardly a "meistersänger" whose name is worthy of being remembered.

Meistersänger.

Much more important than these tedious manufacturers of verse were the unknown authors of the earliest attempts at dramatic composition. In the 10th century Hroswitha, the abbess of Gandersheim, wrote Latin imitations of Terence; but they were without influence on the progress of culture. The real beginnings of the modern drama were the crude representations of scriptural subjects with which the clergy strove to replace certain pagan festivals. These representations gradually passed into the "Mysteries" or "Miracle Plays," in which there was a rough endeavor to dramatize the events celebrated at Easter and other sacred seasons. They were acted at first in churches, but afterwards in open courts and market places; and for many hours, sometimes day after day, they were listened to by enormous audiences. The fragment of a Swiss "Mystery" of the 13th century has survived; but the earliest that has come down to us in a complete form is a play of the first half of the 14th century, treating of the parable of the ten virgins. Like those of France and England, these mediæval German dramas display little imagination; and they are often astonishingly grotesque in their handling of the most awful themes. Along with them grew up what were known as "Shrove Tuesday Plays," dialogues setting forth some scene of noisy fun, such as a quarrel between a husband and wife, with a few wise saws interspersed. They were declaimed without much ceremony in the public room of an inn, or before the door of a prominent citizen, and gave ample occasion for impromptu wit. Nuremberg seems to have been particularly fond of "Shrove Tuesday Plays," for one of its poets, Hans Rosenblüt, who flourished about the middle of the 15th century, was the most prolific author of them. A little later he was extensively imitated by Hans Folz, a Nuremberg barber and meistersänger.

Beginnings of the drama.

Miracle plays.

By far the most interesting writers of the 14th century were the mystics, who continued the movement started by Eckhart. Johannes Tauler of Strasburg (1300–61) had not the originality and force of his predecessor, but the ultimate mysteries of the world had an intense fascination for him, and his tender and sensitive spirit opened itself to lights which find no way of entrance into more robust and logical intellects. He did not in the main pass beyond the speculations of Eckhart, but he added grace and finish to their expression, and made them a greater popular power than they could have become through the master's writings. Heinrich Suso, of Constance (1300–65), who has been called "the minnesänger of the love of God," made the doctrines of Eckhart an occasion for the outpourings of a full and sometimes extravagant fancy. Eckhart's teaching was also put into shape by an unknown author, whose work was afterwards published by Luther under the title *Eyn deutsch Theologia*. To all these writers the phenomenal world is in its nature evil, but it is also unreal; the only reality they recognize is a world outside the limits of space and time, in union with which man rises to his true life. They are chiefly of importance in the history of speculative thought, but even from the point of view of literature they were of high service in the development of a rich and vigorous prose.

Mystics.

A plain narrative prose style was cultivated in the chronicles which began at this time to be written in different parts of Germany. The Limburg Chronicle written between 1336 and 1398, the Alsace Chronicle about 1386, and the Thuringian Chronicle, by Rothe, a monk of Eisenach, about 1430 have all considerable historical value; and the fact that they are in German, not like previous chronicles in Latin, proves the rising respect among the people for their native speech.

Prose chronicles.

During the latter part of the 15th century there was in Germany, as in the other leading European nations, a great revival of intellectual life. And it was due to the same causes as prevailed elsewhere,—especially the re-discovery of Greek literature and the invention of printing. The movement was naturally most powerfully felt in the universities. The first of these institutions had been founded early in the 14th century by Charles IV. in Prague. Soon afterwards others were established in Vienna, Heidelberg, Cologne, and Erfurt; and in the 15th century universities were set up also in Rostock, Greifswald, Tübingen, Leipsic, and elsewhere. For a long time law and divinity were almost the only subjects studied; but when the Renaissance passed from Italy into Germany, university teaching became the instrument of a freer and larger culture. Scholastic philosophy fell into disrepute; the most active minds occupied themselves only with the intellectual treasures of the ancient world. The men devoted to the new studies were called "Humanists," and they carried on continual warfare with the more ignorant and intolerant of the clergy. Unfortunately they knew nothing of the value of their own language; they wrote, as the scholastic philosophers had done, solely in Latin, and they gave but slight and contemptuous attention to the movements of popular literature.

The Renaissance.

Yet the popular literature of their time was quite worthy of study, for the stir of new life had affected not only scholars but all classes of society, citizens and even peasants included. It is surprising how many books found their way to the public between 1450 and the outbreak of the Reformation; every one seemed anxious that the newly discovered process by which writers could appeal to so wide an audience should be turned to the utmost possible advantage. Of this great mass of literature a comparatively small proportion was created in obedience to the free impulses of the intellect. The problems of the time were mainly social and practical; men were less moved by ideal interests than by questions as to the tyranny of the princes, the greed and sensuality of the clergy, the worldliness of the papacy, the powerlessness of the crown to enforce peace and order. Multitudes of little tales in prose and verse appeared, in which the princes, the nobles, the clergy and sometimes rich citizens, were held up to ridicule. The "Shrove Tuesday Plays," which now became extremely popular, also expressed the general discontent; and there were even "Miracle Plays" whose object was to reveal the

Popular literature of 15th century.

wrongs of the people. In one of them the leading character of which was Joanna, the mythical female pope, a clerical author did not hesitate to pour contempt on the Roman see itself.

Reineke Vos.

By far the greatest of these satirical writings was the epic narrative *Reineke Vos*. It has been already stated that the stories of "Reynard the Fox" and "Isengrim the Wolf" probably belong to prehistoric ages. They became current, through the Franks, in Lorraine and France; and from the 11th to the 15th century they formed the subject of many works in Latin, French, and German. The epic to which allusion is now made appeared in 1498, and was probably by Hermann Barkhusen, a printer of Rostock. It is in Low German, and its materials were obtained from a prose version of the tale which had appeared some years before in Holland, and of which Caxton printed an English translation. Originally, the story had no satirical significance; it was a simple expression of interest in what may be called the social life of wild animals. In the hands of the author of this Low German poem, it becomes an instrument of satire on some enduring tendencies of human nature. He does not lash himself into fury at the vices he chastises; he laughs at while he exposes them. His humor is broad and frank, and he did more than any one else to make Reynard the type of the resource and cunning which overmaster not only brute force but even truth and justice. There are several renderings of the poem into High German, the most important being the well-known work of Goethe in hexameters.

Brandt.

Another popular satirical work was the *Narrenschiff* ("Ship of Fools") of Sebastian Brandt, published in Basel in 1494. It is an allegorical poem of more than a hundred sections, in which the vices are satirized as fools. This work passed through many editions, and was rendered into more than one Low German dialect, and into Latin, French, and English; it was even made the subject of a series of sermons by Geiler, of Kaisersberg, a well-known preacher of the day, who had himself some satirical talent. Brandt was personally of a mild and unassuming character, and the fact that he became a satirist in spite of himself is a striking proof of the confusion which had fallen upon both church and state. Now that the occasion of his book has passed away, it is difficult to realize that it once enjoyed almost unprecedented popularity. We cannot but feel that the writer was an honest man; but his allegories are without force or charm, and his moral lessons have been the commonplaces of every civilized society.

Murner.

A satirist of a bolder type was Thomas Murner, who, although he lived far into the age of the Reformation, belongs in spirit altogether to the preceding period. He was a preacher, and both in sermons and in secular writings attacked without mercy the classes who were the butts of his fellow-satirists. After the beginning of the Reformation he included Luther among the objects of his comprehensive dislikes. His laughter was loud and harsh, and can hardly have been favorable to any small buddings of charity that may have revealed themselves among the antagonisms of his generation.

Tyll Eulenspiegel.

One of the favorite books of this time was *Tyll Eulenspiegel*. It was published in 1519, and the author (probably Murner) seems to have included in it many anecdotes already well known. According to the preface, Tyll was a Brunswick peasant of the 14th century, who went about the country perpetrating practical jokes. The force of his humor mainly consists in taking every word addressed to him in its most literal sense, and in giving it applications altogether different from those intended by the speaker. There are readers who still find amusement in his rough pleasantries.

Maximilian I.

During the better part of this stirring period Maximilian I. was emperor, and he interested himself a good deal in the current literature. As in politics, however, so in poetry, his sympathies were altogether with an earlier age; and he attempted to revive the taste for mediæval romance. From a sketch said to have been prepared by him, Melchior Pfinzig celebrated in *Theuerdank* the emperor's marriage with Princess Mary of Burgundy. The work was splendidly printed, and attracted much notice; but romantic poetry, once so fascinating, produces in its pages the effect of an elderly coquette who, refusing to believe in the ravages of years, tricks herself out in the gay adornments of youth. An earlier book, the *Weiss Kunig*, an autobiography of Maximilian, written by his direction in prose by his secretary Treizsauerwein, has the excellence neither of a chronicle nor of a romance; it is for the most part the fantastic work of a mind which misunderstood its epoch and its own powers.

Popular poetry.

Behind the strife and noise of contending sections there was slowly growing up an admirable intellectual product of Germany,—its popular poetry. One of the earliest writers who struck the note of the popular poets was Veit Weber, a Swiss who fought with his countrymen against Charles the Bold, and who celebrated in vigorous verses the battles of Granson, Murten, and Nancy. From this time the German people had always a living poetry of their own, created by unknown authors, but caught up by the masses, passed on from village to village till it was everywhere known, and handed down by each generation to its successors. This popular poetry ultimately reflected every aspect of daily life among the humbler classes; each section among them had its appropriate lyrics, and there were songs of youth, of age, and of middle life. There is no elaboration in these offshoots of the popular fancy, but many of them have an artless beauty which touches the fountains of smiles and tears, and which had an irresistible fascination for the poets of the greatest period of German literature.

Reformation period.

IV. *The Century of the Reformation.*—It is possible that if there had been no Reformation the Renaissance would have revealed itself in Germany in a great literary movement, as in France and England, or in a great artistic movement, as in Italy. The conditions of both movements were present in the labors of the humanists on the one hand, and of the Holbeins, Albert Dürer, and Lucas Cranach on the other. But the questions of the Reformation were too profound and agitating for the mind of the nation to turn seriously to any task save that which they imposed. Thus it happened that the young shoots of the Renaissance withered almost before they were in leaf. It was settled that Germany must wait until a much later time for the full exercise of her highest energies.

Luther.

In literature not less than in religion Luther (1483–1546) was the commanding spirit of the age; but he was so rather by accident than by choice. For form for its own sake he cared little; he studied it solely that he might the better produce the moral effect at which he aimed. It is hardly possibly for any one to sympathize now with the violence and the dogmatism of his tracts, addresses, and sermons; but they had the high merit of addressing the nation in a language it could understand. They are always clear, simple, warm with the glow of a passionate nature; and amid their noise and fury an attentive ear will sometimes catch the still small voice of a spirit touched to finer issues than mere party warfare. "My husk may be hard," he himself said, "but the kernel is soft and sweet." We do extreme injustice to Luther if we do not recognize in him a strongly poetic element,—an element which had free play only in the best of his private letters, and in his still popular hymns. By the highest of his literary achievements, his translation of the Bible, he made a truly splendid contribution to the spiritual life of his people. No body of literature has been so fortunate in its translators as the Scriptures; and Luther's rendering ranks with the best. Its absolute simplicity brings it to the level of a child's understanding; its strength and grace give it an enduring place as a work of art. Germany instantly felt its charm; and for three centuries it has been to innumerable millions the supreme consoler and sanctifier, the power associated with their tenderest, most pathetic memories, the one link which has connected sordid lives with noble and sublime ideas. And for the first time it gave the nation a literary language. Up to this stage every author had written in the dialect with which he was himself familiar; henceforth for the men of Swabia, of Bavaria, of Saxony, and of all other districts there was a common speech, which the writers of each state could use without any sense of inferiority to those of another. It is thus to Luther that the Germans owe the most essential of all the conditions of a truly national life and literature.

Ulrich von Hutten.

The writer who deserves to stand next to Luther is Ulrich von Hutten (1488–1523). An accomplished humanist, he effectively at-

tacked the enemies of the new culture in the *Epistolæ Obscurorum Virorum*, of which he was one of the chief writers. This was before the special work of Luther began; and at a still earlier period he had assailed in a series of fine Latin orations the tyranny of Duke Ulrich of Würtemberg, who was accused of murdering a member of Hutten's family. He had little real sympathy with Luther's religious aims; but he threw himself heartily into a movement by which it seemed possible to purge the state of the spiritual and secular ills which were in deadly antagonism to the progressive energy of humanism. His German writings are mainly short satirical poems and prose dialogues and addresses. Their style is direct, bold, and trenchant; but they are now interesting mainly because of the spirit of freedom which breathes through them, the lofty political ideals of the writer, and his generous ardor for the popular welfare.

Hans Sachs.

A far more voluminous author than Hutten or Luther was Hans Sachs, meistersänger of Nuremberg (1494–1576). He was, indeed, one of the most prolific of German writers, having composed, according to his own calculation, more than 6000 poems. Although extremely popular in his own time, Sachs was almost forgotten after his death. His memory was revived by Wieland and Goethe, and he is now universally admitted to have been the chief German poet of the 16th century. Every species of verse then known he freely cultivated, and there is no important element of his age which is not touched in one or other of his works. He had little of the culture of the schools, and many of his verses are excessively rude. But Hans, had considerable force of imagination, sly humor, and, in his happiest moments, a true feeling for melody. His best works are his "Shrove Tuesday Plays." It is true he makes hardly more attempt than Rosenblüt to develop a dramatic action, but his characters have life, and in many individual scenes are artistically grouped. His didactic dialogues and satirical tales present a remarkably vivid picture of the ideas, controversies, and moral sentiments of his generation; and some of his lyrics still live in the memory of the nation. The song in which he hailed the "Wittenberg Nightingale" gave fine utterance to the reverence of the Lutherans for their chief, and in his hymn, *Warum betrübst du dich, mein Herz?* he so happily met the spiritual need of the day that it was soon translated into eight languages, including English, French, and Greek.

Fischart.

If Hans Sachs was the most industrious poet of the century, Johann Fischart was beyond all comparison its greatest satirist. There was a distinctly Rabelaisian touch in this restless, bizarre, and effusive spirit,—a man of upright and manly character, keenly alive to the evils of his time, and continually opening fire at new points on his enemies. He was an enthusiast for the Reformation, and did it more lasting service among the middle class than half the theologians. His chief work was an adaptation of Rabelais's *Gargantua*, which he rendered with an insight into its purpose, and a fulness of sympathy with its methods, unsurpassed even by Urquhart. In the poem, *Das Glückhaft Schiff*, he gives evidence of a faculty for stirring narrative verse, but his prose is richer, fuller, and more free. Considering how imperfectly prose style was then developed, he had an astonishing command over the resources of the language. He delighted in new and complicated word-formations, and by means of them often succeeded, while dealing with his main theme, in casting side lights on its subordinate branches. Even he, penetrating and enlightened as he was, could not rise so far above his age as to condemn the burning of witches; but hardly another popular folly escaped his glance. From the evil practices of hypocritical priests to the impudence of astrologers and weather prophets every abuse found in him a watchful critic; and nothing of the kind could be more admirable than the skill with which he excites contempt while professing to write in a spirit of respect and credulity. The secret of his power lay also partly in his profound humanity, for this scathing satirist was at heart thoroughly genial; his mockery had its root in an abiding faith in justice.

Prose writers.

Several other cultivators of prose style deserve mention. Albert Dürer, whose paintings, drawings, and engravings gave to the age of transition between mediævalism and the modern world its most perfect artistic expression, wrote several scientific treatises, one of which, on the proportions of the human body, is a masterpiece of calm, clear, and systematic exposition. Johann Thurnmeier, called Aventinus (1466–1534), Sebastian Franck (1500–45), and Ægidius Tschudi, of Glarus (1505–72), wrote histories which, as ordered narratives, rank considerably above mere chronicles. The autobiography of Götz von Berlichingen, if its style is without merit, has an enduring interest as a sketch of the rude lives of the petty nobles at the time when the old social order was breaking up under the influence of new ideas. Huldrich Zwingli, the Swiss Reformer (1484–1531), could state an argument with logical precision, but his style is thin and weak in comparison with the nervous force of Luther. Johann Agricola (1492–1566) wrote some theological works on the Catholic side; he is chiefly important, however, for a collection of German proverbs, which afford important evidence as to the currents of popular thought. Of a far higher class as a religious writer was Johann Arndt (1555–1621), who wrote the most widely read work of the 16th century, *Vier Bücher vom Wahren Christenthum* ("Four Books on True Christianity"). Soon after Luther's death the doctrines of the Reformation lost nearly all vitality; becoming the subjects of vehement controversy among contending theologians, they ceased to interest the masses, who turned to simpler and more congenial themes. Arndt, like Eckhart, Tauler, and Luther himself, being a man of religious genius, saw the futility of these noisy disputes, and brushing them aside went to the heart of Christianity as a power fitted to nourish spiritual feeling and to govern conduct. His work appeared in Magdeburg in 1610, passed through edition after edition, and was translated into eleven languages. It still has a place of its own, for beneath the forms of a past age there burns the fire of a true enthusiasm. Sebastian Franck, already mentioned as a historian, wrote some religious works in a spirit akin to that of Arndt; but he lacked the intensity, the power of touching the popular mind, which was possessed by the later writer. Less practical in tendency, but incomparably deeper in philosophic thought, were the writings of the Görlitz theosophist, Jacob Boehme (1575–1624). Boehme is in many respects one of the most striking figures in the history of German speculation. A man of mild and humble temper, working in patient obscurity as a shoemaker, he spent his life in grappling with the vastest problems which perplex humanity. Starting from the dogmas of Christianity, he sought to ground them in the deepest reason; and although he often appears to darken counsel by words, yet his writings contain many bold suggestions, which have profoundly influenced later philosophical systems. There are times when one feels that his struggling thought is imperfectly uttered only because it is not expressed in poetic forms. For Boehme was one of those thinkers who occupy the borderland between philosophy and poetry, a fact often perceptible in the concrete shape which the most abstract ideas assume in his hands. There is a touch of poetry in the very title of his first and best known, although not perhaps his best, book, *Aurora*.

Arndt.

Boehme.

The secular poetry of this period, if we except the works of Hans Sachs and Fischart, is without value. An ambitious didactic poem by Rollenhagen, *Der Froschmäusler* gained a certain reputation; but it stands far beneath *Reineke Vos*, of which it is partly an imitation.

Religious lyrics.

The religious lyrics of the age are, however, of high excellence; they, indeed, are the sole works in which a perfect marriage was effected between idea and form in the epoch of the Reformation. In his grand battle-hymn *Ein feste Burg ist unser Gott*, in his pathetic verses *Aus tieffer Not schrey ich zu dir*, and in other lyrics, Luther led the way; and he was, as we have seen, followed by Hans Sachs. Nicolaus Hermann in his *Erschienen ist der herrlich Tag*, Paul Eber in his *Wenn wir in höchsten Nöthen sein*, Philip Nicolai in his *Wie schön leucht uns der Morgenstern*, and several other writers not less distinguished, created, in moments of genuine inspiration, lyrics which must move men while religious instincts survive. The adherents of the Reformation everywhere opened their hearts to these beautiful poems, for in them alone, not in creeds or sermons or controversial treatises, were the deepest emotions of the time freely poured forth. Next to the translation of the Bible, nothing did so much as the popular hymns to unite the Protestants, to stimulate their faith, and to intensify their courage.

Growth of the drama.

During this century the drama made considerable progress. Besides the "Mysteries" and "Shrove Tuesday Plays," "School Comedies," in imitation of Terence and Plautus, were written and acted in the universities and public schools. Luther, with the large humanity characteristic of him when dogmatic disputes were not in question, encouraged these comedies, and was, indeed, friendly to dramatic effort of all kinds. To person who complained that modesty was often offended by the actors he replied that if they carried out their principle they would have to refrain from reading the Bible. When the Jesuits began to agitate in opposition to Protestantism they detected at once, with their usual tact, the importance of this element in popular life; and through their influence more attention was paid not only to the plays but to the manner in which they were represented. Towards the end of the 16th century Germany was visited by a band of English comedians, who went about acting in their own language. They appear to have produced a deep impression; and at least one of their importations, the clown, the "Pickelhäring" of the Dutch, survived in Hanswurst or Jack Pudding, who was for more than a century an indispensable character in every play designed to gratify the prevailing taste. In imitation of the English comedians, wandering companies, consisting largely of idle students, now began to be formed, and thrilled both rustic and city audiences with blood-and-thunder tragedies, and with comedies too coarse to deserve even the name of farces. About the middle of the century a theatre was built in Nuremberg, and Augsburg and other cities soon followed the example. Duke Julius of Brunswick (1564–1613) not only built a theatre in his capital but maintained a permanent company; and he amused himself by writing for it comedies and tragedies in the approved style of the day. It is significant of the stage of literary culture reached by Germany that she enjoyed the barbarous productions of this scribbling prince while English audiences were appreciating "Hamlet" and "Othello."

Thirty Years' War.

V. *The Period of Decay.*—The period at which we have now arrived is in many respects the most dismal in German history. From 1618 to 1648 the country was desolated by the Thirty Years' War, a struggle which—as Gustavus Adolphus, its greatest hero, declared—absorbed into itself all the other wars of Europe. It completed the disintegration of Germany, blurred every great national memory, fastened upon the people hundreds of petty despotisms, reduced the population by more than half, caused a whole generation to grow up in ignorance, accustomed all classes to an almost incredible brutality of manners, and put an end to the material prosperity which had been steadily growing during the 16th century. It is not surprising that pure literature drooped and nearly died out during the time which followed this tremendous war, for the conditions of pure literature were almost wholly wanting. Had a man of high genius arisen, the buds of his fancy must have faded for lack of light and air.

Religious lyrics.

The only species of literature for which the conditions were favorable was the religious lyric. Under the pressure of grinding care, with no hope that a better day would dawn for them in this world, meditative and gentle spirits devoted their thoughts to another life; and many of them linked themselves to the truest poets of the previous century by giving musical voice to their spiritual fears and joys. Their prevailing tone in regard to "things seen" is one of profound melancholy; but all the brighter are the strange lights from the invisible which break through the gloom. The greatest of these writers is Paul Gerhardt (1606–75), many of whose hymns —such as *O Haupt voll Blut und Wunden, O Welt sieh hier dein Leben*—penetrate to the essence of Christianity as the religion of humility, of sacrifice, and of sorrow. He had worthy associates among the Protestants in Johann Rist (1607–67), Joachim Neander (1610–88), and Louise Henriette of Brandenburg, wife of the Great Elector (1627–67). Some of the wiser Jesuits also attempted the lyrical expression of religious feeling; and one of them, Friedrich von Spee (1592–1635), fell little short of the best among his Lutheran rivals. Spee was a man of admirable moral as well as literary qualities. Asked by the elector of Mainz how it happened that at the age of forty his hair was white, he answered, "It is because I have accompanied to the stake so many women accused of witchcraft, not one of whom was guilty."

Literary societies.

The standard of pure speech set up by Luther in his translation of the Bible had not been maintained by later writers. The innumerable dialects of Germany are an almost inexhaustible fountain for the renewal of the youth of her literary language; but when the literary language was less fixed than it is now, they were also a temptation to barbarism. In addition to the evils of excessive provinciality, the written speech had suffered from a too generous importation of Latin, Spanish, and French words. In the early years of the 17th century the prevailing laxity suggested to an enlightened prince, Louis of Anhalt-Köthen, that it would be desirable to introduce into Germany institutions resembling the Italian academies. Accordingly, in 1617, the "Fruchtbringende Gesellschaft" ("The Fruit-bearing Society") was established, —a union which took the form of an order, with a palm tree for its emblem, and the words "Alles zu Nutzen" ("Everything for use") for its motto. It immediately became fashionable for members of the highest classes of central Germany to belong to this society; and at a somewhat later time other societies were started in imitation of it. Of these the most famous was the "Order of the Pegnitzschäfer" ("Shepherds of the River Pegnitz") in Nuremberg, which to some extent took the place of the school of meistersänger on which honor had been reflected by Hans Sachs.

These societies were associated with much pedantic folly, and from none of them proceeded any great work of genius; but they did good service by at least protesting against unlawful forms of speech. One of the earliest writers who worked in their spirit was Weckherlin (1584–1651), who, being associated with the German embassy in London, became intimately acquainted with some of the many forms in which the English genius then revealed itself. He wrote a number of odes, idylls, and sonnets, with an evident desire to give them a careful artistic finish. To him belongs the doubtful honor of having introduced alexandrines into German poetry,—a measure totally unsuited to the national spirit, but which for more than a century was in general use. The fame of Weckherlin was soon overshadowed by that of Martin Opitz (1597–1639). The beginnings of modern German poetry are often dated from the publication of his critical book, *Die deutsche Poeterei*, which appeared in 1624, and enjoyed an astonishing popularity. It became a sort of secular Bible to the "Fruit-bearing Society," of which Opitz was a member, and was regarded by several generations of verse-makers as an almost infallible guide. In regard to merely outward forms, it deserved its reputation, for Opitz was the first German writer who attempted sharply to distinguish the different species of poetry, to bring together some of the external laws which govern them, and to insist with emphasis that purity of style is essential to high literary effect. He altogether missed the fact, however, that poetry must be the expression of an emotional life; it became in his exposition a mere handicraft, for excellence in which industry and familiarity with good models are alone necessary. The result is seen in his own lyrical and didactic poems, which are laudably correct in language and in metre, but are hardly once lighted up by the fire of intense feeling.

Weckherlin.

First Silesian school.

Opitz.

Opitz was born in Silesia; and from this circumstance the writers who shared his tendency or came under his influence are known as the first Silesian school. By far the most distinguished member of this so-called school was Paul Fleming (1609–40), the only secular German poet of the 17th century of whom it can be confidently said that he was endowed with true genius. He did not live long enough to reveal his full capacity; he confined himself to short rapid flights, and all his lyrics are contained in a moderately sized volume, *Geistliche und Weltliche Poemata.* This single volume, however, comprises enough to secure for him an enduring place in literature. He moves freely over the whole range of lyrical poetry, but his charm is at once strongest and most delicate in his love verses, which sometimes recall the gaiety of Herrick, although a touch of sentimentalism distinguishes the German writer from the more worldly Englishman. A fine spirit of manliness is the note of Fleming's sonnets; and in several hymns he almost equals the religious depth of Gerhardt. Even in its artistic qualities his best work is higher than anything achieved by Opitz; in its

Paul Fleming.

power of awakening permanent human sympathies it stands alone in its era.

Gryphius. Another writer of the first Silesian school was Andreas Gryphius (1616–64), who sought to create a drama in accordance with the laws laid down by Opitz. He was the first German dramatist who divided his tragedies—of which he wrote five—into five acts; but his characters are roughly conceived, and he produces his effects rather by violence and bombast than by the gradual evolution of a definite plan. His comedies, although also rude, have more life than his tragedies. In one of them, *Peter Squenz*, there are traces of Shakespeare's *Midsummer Night's Dream*, of which Gryphius appears to have had some knowledge through a third writer. Friedrich von Logau (1604–55) applied the principles of Opitz in epigram. He had a decided talent for terse, emphatic expression, and a considerable number of the vast collection of his epigrams have a keenness of edge which must have made him a dreaded enemy. His prevailing tone is satirical, and the chief object of his satire is the moral corruption of his time. Joachim Rachel (1618–69) was another satirist who strove by means of polished verses to castigate popular vices; but he lacked force and invention. There was much more vigor in the *Scherzgedichte* of Hans Wilmsen Lauremberg (1591–1659), who wrote in Platt Deutsch; he, however, can hardly be claimed as a member of the first Silesian school. Philip von Zesen (1619–89), a writer of some versatility, wrought in the spirit of Opitz by warring against foreign words which had intruded into German,—a warfare in which his zeal was not always as wise as it was patriotic. He founded in Hamburg, in imitation of the "Fruit-bearing Society," an association (the "Deutschgesinnte Gesellschaft") inspired by his enthusiasm for Teutonic purity of speech.

Logau.

Pegnitzschäfer. While the admirers of Opitz were striving, with the best intentions, to introduce a correct poetic style, a movement of a very different kind originated among the "Pegnitzschäfer" of Nuremberg. The members of this society, conscious of the barrenness of existing poetry, and not feeling in themselves the sources of a higher activity, turned for help to Italian literature. Instead of studying the great Italian poets they attached themselves to Marino and his extravagant school; and the chief result was a number of fantastic pastorals, the writers of which seemed to have no other aim than to show how much silly affectation the German language may be made to express. Their tendency was carried to its utmost development by the second Silesian school, whose leading representatives were Hoffmannswaldau (1618–79) and Lohenstein (1635–83). Hoffmannswaldau wrote odes, pastorals, and heroic epistles, which are marked by a childish foppery of manner, and whose tone affords startling evidence of the moral laxity of the society to which they were addressed. Lohenstein chiefly cultivated the drama, and he has the distinction of having written perhaps the worst plays ever accepted as literature by a modern community. They are so wild and bombastic that, even if presented as burlesques, they would now be condemned as ridiculously extravagant. The lyrics of this pretentious writer are not less crude and unnatural than his plays.

Second Silesian school.

Court poets. As the century advanced, the German courts passed more and more under the influence of France. Pocket editions of Louis XIV. were to be found in all the little capitals, courtiers talked more French than German, and it was unfashionable not to know, or not to affect to know, contemporary French literature. It was, therefore, inevitable that some writers should turn away from the path of the second Silesian school, and compete for court favor by imitating the French style. This was done by Canitz (1654–99), Besser (1654–1729), König (1688–1744), and many other authors of the same class. These "court poets" took Boileau for their guide, and had, therefore, the negative merit of avoiding the absurdities of Lohenstein and Hoffmannswaldau. But they were, as a rule, tame, cold, and dull. In Canitz alone, who was a Prussian statesman and wrote for his pleasure, is there any evidence of original energy; the others were professional versifiers who produced appropriate odes and sonnets at the bidding of their employers.

During the greater part of the 17th century Germany produced few prose works that can now be tolerated. Notwithstanding the efforts of the purists, the language became more and more corrupt, and most writers were either artificial, or pedantic, or coarse. One of the small number whose power we can still feel was Grimmelshausen, whose *Simplicissimus* (1659) has qualities bordering upon genius. The hero is a peasant's son, who tells his own tale. Torn from his parents during the Thirty Years' War, he is brought up by a hermit; afterwards in the service of a commandant, he makes himself notorious for tricks like those of Tyll Eulenspiegel; he then becomes a soldier, rises to wealth and rank, but ultimately loses both, passes through many wild adventures, and retires from the world to a desert island, in which he devotes himself to religion. The value of the book consists in its graphic pictures of the horrors of the Thirty Years' War,—pictures relieved by touches of rough, sometimes of the coarsest, humor. Another writer of great but insufficiently cultivated talent was Moscherosch, author of *Gesichte Philanders von Sittewalt* (1650), which is partly an imitation of the Sueños of Quevedo. It is made up of a number of visions or dreams, some of which, like passages of *Simplicissimus*, convey a vivid idea of the sufferings of Germany during her great struggle; in others the writer strikes with effect at popular follies, including the extravagances of the second Silesian school. Sigmund von Birken wrote a history of the house of Austria, which, although one-sided, is not without merit as a plain narrative; and an ecclesiastical history by Gottfried Arndt has some interest as an attempt to do justice to heretics condemned by the church. A very good book of travels was written by Adam Olearius, describing the adventures of a mission to Persia, of which the author and Paul Fleming were subordinate officials. A Protestant pastor, Balthasar Schupp (1610–61), was the author of several didactic prose works, which, although rough in form, display native wit, and pour wholesome ridicule on the follies and barbarisms of contemporary writers. Against these more or less valuable prose writings we must set piles of enormous romances in the style of D'Urfé and Mademoiselle Scudéry. The favorite authors of these astonishing productions were Buchholtz, who wrote *Hercules und Valisca*, and *Herculiscus und Herculadisla;* Anton Ulrich, duke of Brunswick, whose *Octavia* was loudly applauded by aristocratic readers; and Von Ziegler, the writer of *The Asiatic Banise*, an incredibly foolish book which, published in 1688, took Germany by storm, and maintained its popularity for more than a generation. Lohenstein was also the author of a romance, dealing with the fortunes of Arminius and Thusnelda. It is hard to understand the interest which works of this class once excited; they are barren of every imaginative quality, with no kind of relation to life, and grotesque in style. They were ultimately driven from the field by imitations of *Robinson Crusoe*, which, notwithstanding the charm of their model, display no more talent than the romances. Various writers imitated *Simplicissimus*, but they succeeded only in reproducing in an exaggerated form its occasional brutalities. Abraham a Sancta Clara (1642–1709), a Vienna priest, whose real name was Megerlin, revealed considerable power of satire in his *Judas der Erzschelm* ("Judas the Arch-Rogue"), and in pamphlets and sermons; but his naturally rich fancy was wholly uncontrolled, and his humorous passages are marred by a far larger number in which he is pedantic or vulgar.

State of the drama. No progress was made during the 17th century towards the formation of a national drama. At the courts the Italian opera was the favorite entertainment, and the wandering companies of actors represented for the most part barbarous plays of their own devising, in which Hanswurst was generally the popular character. Occasionally a man of some talent found his way into these companies; and one such actor, Velthen, showed so much insight as to include in his repertory some of the works of Molière. But the general tendency of what passed for the drama was from bad to worse, and the usual character of the plays to a considerable extent justified the hatred with which they were denounced by the clergy.

For a time it almost seemed as if Germany could never hope to emerge from the intellectual degradation into which she had sunk; but in reality the higher forces of the nation were rallying in preparation for a new era. One of the first symptoms of revival was presented by the remarkable

Pietism. pietistic movement, which, although it ultimately led to the formation of the pettiest of petty sects, was in its origin noble both in aim and in method. Its originators were the ardent, generous, and eloquent Jacob Spener (1633–1705), and August Hermann Francke (1663–1727). The labors of these writers and preachers, who had close affinity to the mystics, not only gave more sincerity to religious forms, but did service to literature by quickening the popular intellect, and awakening emotions which could find no satisfaction in the tedious writings of the day. Of still greater importance were the beginnings of modern German philosophy. It was in this dreary period that Germany gave birth to one of the most brilliant of her thinkers, Leibnitz (1646–1716). The prevailing style of the day—"Mischmasch," he called it—seems to have disgusted him with his own language, for nearly all his writings are in French or Latin. Nevertheless, he exercised a profound influence on the best minds of his generation. His monadology, his doctrine of the pre-established harmony, his theory of the best of possible worlds, while carrying on the central current of European thought, offered Germany new problems for solution, and helped to replace a rigid orthodoxy by a spirit of disinterested curiosity. The task of giving shape to his ideas was undertaken by Wolf (1679–1754), who had none of Leibnitz's genius, and often crushed his fruitful suggestions under a burden of logical proofs. The disciple, however, so far taught in his master's spirit as to exalt the claims of reason over mere authority; he also encouraged habits of systematic thinking, and proved by his practice that serious writers had no excuse for clothing their doctrines in any other language than their own. Less philosophical than Leibnitz, and even than Wolf, Christian Thomasius (1655–1728) was an impressive popular thinker. He edited the first German periodical, a sort of monthly magazine, in which he vigorously attacked pedants and bigots. His style, although not pure or graceful, received glow and warmth from his moral earnestness. Through him literature became a great practical power, for it was mainly he who put an end to the burning of witches and to punishment by torture.

Philosophy. Leibnitz. Wolf. Thomasius.

Even in poetry, before the close of this period, there were a few glimmerings of dawn. Wernicke, a man of cultivated and severe taste, published a volume of epigrams (1697) in which he thrust home at the follies of Lohenstein and his followers; and that his mockery had effect was plain from the outcry of two noisy members of the school, Postel and Hunold. Günther (1695–1723), who died too soon for his genius, wrote lyrics in which the voice of nature was once more heard. "A poet in the full sense of the word," Goethe calls him; and no one can realize how great was his achievement without making some acquaintances with his truly dismal predecessors. Brockes (1680–1747) had not Günther's fine spontaneity, but he had the merit of giving simple expression to unaffected pleasures—a virtue for which historians of literature, remembering the formality of the court poets and the insincere posturing of the second Silesian school, readily forgive his occasional flatness and garrulity. He was the first German poet who displayed some knowledge of English literature. Although unacquainted with Shakespeare, he directed his countrymen to Milton, Young, and Pope; and he appended to his chief work, *Irdisches Vergnügen in Gott*, a fair translation of Thomson's *Seasons*.

VI. *The Period of Revival.*—For five centuries there had been no great literary period in Germany which deserves to be named with the famous periods in the history of England, France, Italy, and Spain. The Reformation was a spiritual achievement of splendid originality, but in literature Germany had for the most part followed timidly in the footsteps of her neighbors. She was soon to make up amply for this tardy progress; and we have now reached the age in which she fairly awoke to a consciousness of her strength—an age mainly of preparation, but one which has also an independent interest, since it includes names that rank high in the history of European as well as of German culture. We have seen that in the midst of the period of decay there were already symptoms of revival. These became more and more numerous, and while they increased, Germany was suddenly startled by the appearance in her midst of a great warrior and statesman. It is impossible to estimate with any approach to exactness the impression produced by Frederick II.; but it is beyond doubt that he profoundly affected the intellectual life not only of Prussia but of Germany. After the Thirty Years' War the people had lost confidence in themselves. They forgot that they had a magnificent history; they only saw that the structure of society had been rudely battered, and that nearly every enterprise of the nation as a whole ended in failure. Frederick the Great restored to them faith in their own vigor; he convinced them that it depended on themselves whether or not they should rise to their ancient place in Europe; and by the prompt, faithful, and energetic discharge of his personal duties he set before them an example which was widely felt. Literature shared the impulse which penetrated the national life. It became stronger, more independent, and moved forward with the assured step of a power conscious of high destinies.

Frederick the Great.

Several causes of a purely literary character contributed to promote this advance. One of these was the revival of classical study in the best sense. Classical study had been pursued with ardor by the humanists; but after them it became dry, pedantic, and tedious, and was subordinated to theological controversy. In the 18th century a number of scholars arose, who, ceasing to interest themselves in merely verbal criticisms, sought to pierce to the meaning of classical writers, to understand and enjoy their imaginative effects, their ideas, and their style. They also strove to construct what the Germans call "Alterthumswissenschaft," the science of antiquity—that is, to comprehend the life of the Greeks and Romans, their religion, art, and philosophy, and to interpret their literature in the light of this knowledge. The movement passed from one university to another and soon made itself felt in the public schools. Thus the best class of minds were familiarized with higher ideals than they had yet known, and received, almost without being aware of it, the germs of new activity. Another cause, which co-operated with the more intelligent study of the classics, was acquaintance with English literature. Hitherto the foreign influences which had affected the Germans had come from Italy, Spain, and, above all, France; but now they began to know something of contemporary English writers, and gradually worked their way back to Shakespeare. The English genius was instinctively recognized as more in harmony with that of Germany than any other, and its products stimulated the free exercise of the imagination and the reason, while the ancient classics led to the perception of the greatest laws of form.

Classical study.

Influence of English literature.

Among the poets who helped to effect the revival of a truly national literature a place of honor belongs to Haller (1708–77), who, although chiefly famous as a man of science, revealed imagination and poetic sympathies in his descriptive and didactic poem *Die Alpen* ("The Alps"). Hagedorn (1708–54) was for a time the most popular poet of his day in virtue of his songs, odes, fables, and narratives in verse. He was of a genial and happy temper; and no author who preceded him was master of so clear, bright, and animated a style. One of the chief characteristics of the time was the tendency of writers to group themselves in schools. If two or three writers who lived in the same place happened to become friends, they forthwith called themselves a school; and the result was that they usually developed some marked common characteristics. These coteries inevitably became more or less narrow and exclusive; but they also stimulated each other to fresh effort, and the clash of their ideals sometimes helped the outside world to new points of view. The Saxon school, whose headquarters were in Leipsic, was for some years more prominent than any of its rivals. It was founded by Gottsched (1700–66), who, although he made himself ridiculous by pedantry and vanity, became the ruling literary man of Germany. He was appointed a professor in Leipsic in 1724, and founded there "The German Society," which soon became the centre of a number of similar bodies for the cultivation of literature. Gottsched aimed at nothing short of the complete reformation of German poetry. He had the sense to see that if he wished to reach the people he must begin with the drama, and he was fortunate enough to find in Frau Neuber, who had formed a company in Leipsic, an intelligent actress capable of giving effect to his ideas. With her help he banished Hanswurst from the stage; and she was forthwith supplied with plays by him-

Gottsched.

self, by his clever wife Louisa Victoria, and by several disciples. He gave his attention chiefly to tragedy, and unfortunately he had but one idea in regard to it—that it had reached the utmost possible excellence in the classic drama of France. The English drama, he admitted, had some merit, but only in so far as it had modelled itself on the work of Corncille and Racine. Hence, in his chief tragedy *Der Sterbende Cato* ("The Dying Cato") he availed himself freely of Addison's *Cato;* the Elizabethan dramatists, of whom his direct knowledge was slight, he believed to be mere barbarians. His taste gave the law in nearly every theatre in which German plays were acted; and it was certainly a good consequence that Lohenstein fell into permanent disrepute, while even the groundlings began to feel that the uncouth works which actors themselves had hitherto produced were, to say the least, far from perfection. On the other hand, the German genius was forced to submit to arbitrary laws antagonistic to its true nature; and so long as its submission lasted, a genuinely native drama was impossible. It was not only in regard to drama that Gottsched insisted on absolute subservience to France. In regard to all species of verse his sympathies were with the court poets, and both by example and by critical precept he insisted that in poetry as in everything else the understanding must be supreme, and that clearness of statement, correctness in the management of figures, and logical arrangement are the highest literary virtues. Regarding the function of imagination and feeling in poetry he had no suggestion to offer.

Swiss School.

There were writers who instinctively felt that this could not be a complete theory; and of these the chief were Bodmer and Breitinger, the leaders of the Swiss school, which was formed in Zürich. These writers, although destitute of creative genius, had nourished their imagination on English poetry, especially on *Paradise Lost*, and it was incredible to them that a critical doctrine could be correct which left out of account or condemned their favorite writers. At first they were on friendly terms with Gottsched, but when the latter harshly criticised a translation of Milton's epic issued by Bodmer, his Swiss rivals prepared to defend themselves; and thus broke out a literary controversy which made much noise at the time, and in which the angry critics, to the edification of onlookers, pelted each other unmercifully with abusive epithets. Neither party was fully conscious of the significance of its attack, and sometimes the warriors seemed almost to change sides. But the general tendency of the dispute was that the Swiss school, amid much exaggeration, defended the claims of free poetic impulse, while the Saxon school, in a narrow and pedantic spirit, maintained those of conscious art. It is hard work now to follow their arguments, but at the time they interested a considerable public in literature, and opened fresh lines of investigation. One of the results was that Baumgarten, a disciple of Wolf, published a book which Germans regard as the beginning of modern æsthetics,—a branch of mental science to which their philosophers have ever since devoted thought and labor.

While this warfare of critics was going on, there were in Leipsic a number of young writers who more or less attached themselves to Gottsched, but who gradually shook off his authority. They founded a periodical, the *Bremer Beiträge* (the "Bremen Contributions"), which had considerable influence in forming their own style, and in keeping alive the popular interest excited by the central controversy. After a while many of them were scattered over different parts of Germany, but they retained their original impulse, and continued to be known as members of the Saxon school. Gellert (1715–69) was by far the most famous of the circle. It is impossible to mention without respect this amiable writer. His plays are unimportant, but his fables and tales reveal so gentle and pure a spirit that we cannot wonder at his great popularity. He was a favorite among all classes, even Frederick the Great himself, who rarely condescended to notice a German author, declaring after a long interview that he was "the most reasonable of German scholars." His supreme defect was a tendency to weak sentimentalism and pious commonplace. Rabener (1714–71) acquired fame as a good-humored satirist. His prose is fresh and clear, but he has not sufficient grasp of any important principle to entitle him to very high rank among moralists. Christian Felix Weisse (1726–1804), the friend of Lessing's youth, failed as a writer of tragedy, but was a favorite author of comic operettas. He was also the first successful German writer for children, and edited for many years a periodical (the *Bibliothek der schönen Wissenschaften*) which had a favorable influence on popular culture. Johann Elias Schlegel (1718–49), uncle of the two Schlegels who became long afterwards leaders of the Romantic school, gave evidence of high dramatic talent, but died when he was beginning to be conscious of his power. Arnald Ebert distinguished himself by good translations from English; and Zachariä wrote with some success mock heroics in the style of *The Rape of the Lock*. Kästner, whose disputations at the Leipsic university were diligently attended by young Lessing, made himself feared as a biting epigrammatist. Cramer became one of the most eloquent preachers of the day, wrote popular religious odes, and edited *The Northern Guardian*, a well-meaning but rather commonplace imitation of the *Guardian* of Steele. These writers, who from being Gottsched's friends all became more or less hostile to him, have a clearness and grace of style which were unknown in the previous century. Another author who was from the beginning Gottsched's enemy, but who had no relation with this particular school, may be here mentioned,—Liscow (1701–60). His prose has nerve and animation, and few satirists have dealt severer blows at literary pretence.

Halle School.

The Halle school of poets was in some respects different both from the Saxon and the Swiss schools. Its original members were Gleim (1719–1803), Uz (1720–96), and Götz (1721–81). These three writers formed a friendship in their student days at Halle, where they came under the influence of the poets, Pastor Lange, and the tutor of his children, Immanuel Pyra, ardent disciples of Bodmer and Breitinger. The young students, while feeling sincere respect for the Swiss critics, did not attempt any very serious flight; they preferred to amuse themselves with lively little anacreontic verses, which they soon brought into high repute. Afterwards Gleim settled in Halberstadt, where he lived to an extreme age. His didactic poem *Halladat*, which he wrote, he himself modestly explained, in order to gratify a wish of his youth to produce a book like the Bible, has no vitality; but during the Seven Years' War he composed *War Songs of a Grenadier*, which were everywhere read, and have not yet lost their popularity. They were edited by Gleim's friend Lessing, who, however, protested against their patriotic vehemence. Gleim was one of the most kindly of men, and became the patron of young poets, several of whom he always had in his pleasant bachelor's home. He also kept up an extensive correspondence with other writers, which is now an important source of information respecting the movements of contemporary literature. One of his most intimate friends, who resembled him only in geniality of disposition, was the noble-hearted Ewald Christian von Kleist (1715–59), who was fatally wounded on the battle-field of Kunersdorf. He would still deserve to be remembered as the man whom, of all others, the equally noble Lessing most loved. His descriptive poem *Frühling* ("Spring") is partly an imitation of Thomson; but it is also the work of an independent lover of nature, who knew how to give beautiful utterance to true and simple feeling. Ramler (1725–98), another friend of Gleim, and the friend, too, of Kleist and Lessing, wrote spirited odes in Horatian metres, which, like the *War Songs of a Grenadier*, gave pleasure because of their strongly patriotic tone,—the direct result in both cases of Frederick's influence. Anna Louisa Karsch (1722–91), a poetess who owed much to Gleim's goodness, was a favorite among the literary men of the day, but her verses are ruder than they ought to have been at so late a date. Idyllic poetry, which Kleist and Götz to some extent cultivated, was taken up in earnest by Solomon Gessner (1730–87), whose prose idylls, *The Death of Abel*, *The First Sailor*, and others, were translated into French and English, and were better received in their foreign dress than in their original form. They are written in an easy style, and express much harmless although somewhat tedious sentiment. He was imitated by Xaver Bronner, a Catholic priest, whose idylls have not half the merit of his autobiography, which affords remarkable insight into the religious life of Catholic Germany about the middle of the 18th century.

Gleim.

Bremer Beiträge.

Religious lyrics.

The religious lyric, which had shared the general decay during the latter half of the 17th century, displayed more vitality during part of

this period. It owed its fresh life mainly to the pietists, who reopened fountains of spiritual feeling that had been apparently dried up by theologians. Among the best of this younger generation of hymn writers were Freylinghausen, Neumeister, and Tersteegen. Their fame was, however, less extensive than that of Count von Zinzendorf (1700–60), the founder of the sect of Herrnhüter or Moravian Brethren. Besides hymns he wrote religious works in prose, and made himself one of the most prominent figures of his time by ardent missionary zeal. His followers, like all deeply religious sects in Germany, delighted in hymns; and many of those they produced are remarkable for the sensuous, sometimes almost sensual, forms in which their emotions are expressed.

Fabulists.

Fables were at this time an extremely popular class of writings, and nearly every imaginative writer sought to distinguish himself as a fabulist. The Swiss school, indeed, in their zeal for a combination of the wonderful and the useful in literature, maintained that the fable was the highest type of literature. As a rule, Lafontaine was taken as the model in works of this kind, but we look in vain among his German imitators for his exquisite grace and naivcté. Gellert stands at the head of the more sentimental fabulists; after him may be named Willanow and Lichtwer. The latter (1719–83) has humor as well as sentiment, and some of his fables have an artistic finish that indicates a faculty by which he might have won distinction in more important labors.

Popular philosophers.

From about the middle of the 18th century onwards a number of prose writers, who may be classed together as popular philosophers, worked effectively for the enlightenment of ordinary readers. They attached themselves to some extent to Wolf; they also came under the influence, although not in any great degree, of the French Encyclopedists; and they were admiring students of the English deists, and of Locke, Shaftesbury, and Hutcheson. They are often condemned for the shallowness of their thought; and if we compare them with the great thinkers who followed them, the condemnation is just. They did not grasp the significance of the problems which had been handed down by Descartes, Spinoza, and Leibnitz, with which Hume was now grappling, and which were soon to enter upon a new phase in the critical philosophy of Kant. In regard to religion they had a very imperfect appreciation of every element that could not be expressed in clear logical statements; feeling and imagination were rigidly subordinated to the understanding. And they had not even a remote suspicion of what is now familiar as the historical spirit, so that they displayed amazing narrowness of vision in their treatment of past spiritual developments, and of contemporary creeds with which they did not happen to agree. But if we are to do justice to these popular philosophers, they must be compared rather with their predecessors than with their successors. An important place belongs to them in the movement by which vital human interests have been raised above theological disputes, by which morality has received a basis independent of dogmatic religion, and by which toleration has been secured for men of every faith. They were penetrated by a truly humane sentiment; and it must be counted a high merit that in a country which had been more or less dominated by pedants, and whose great writers of a later age have not always attempted to be both profound and clear, they sought to express themselves in unpretending and straightforward German. The chief of the popular philosophers was Moses Mendelssohn (1729–86), not a deep or massive thinker, but a man of fine moral sympathies, an enthusiast for freedom—from the lack of which he himself, as a Jew, keenly suffered—and an incisive psychological analyst. His friend, Frederick Nicolai (1733–1811), the Berlin book-seller, had the misfortune to outlive his epoch. He had only words of contempt for Goethe and Schiller; and Kant, whom he did not profess to understand, seemed to him a sort of cross between a bungler and an impostor. These terrible mistakes have made poor Nicolai, notwithstanding his lifelong warfare against bigotry, the type of a narrow-minded bigot. Yet in his earlier days he was recognized by such a judge as Lessing, with whose friendship he was honored, as a writer of talent. And his *Bibliothek* ("Library"), the most important literary periodical of his day, did excellent service by providing the popular philosophers with a medium for the expression of their opinions on all the great questions which then agitated Germany. Other popular philosophers were George Sulzer (1720–79), who devoted himself to æsthetics in the spirit of the Swiss school, but with the advantage of later lights; Thomas Abbt (1738–66), whose style was one of uncommon vigor; Christian Garve (1742–98), who did not attempt any great original work, but in letters and articles examined many individual philosophic questions from new points of view; and Johann Jacob Engel (1741–1802), whose *Philosoph für die Welt* ("Philosopher for the World") interested a class of readers who would have been unable to follow a more adventurous guide. Zimmermann (1728–95) hardly deserves to be mentioned in such good company; but his *Betrachtungen über die Einsamkeit* ("Observations on Solitude") by its sentimentalism and rhetoric carried his name far beyond the bounds of Germany. Some theologians, without exactly sharing the beliefs of the popular philosophers, were profoundly affected by them. Among these were Mosheim, the ecclesiastical historian; Spalding, the translator of Shaftesbury; and Jerusalem, the father of the young writer whose suicide suggested some elements in Goethe's *Werther*. These liberal theologians did not hold a very intelligible logical position, but they were of some importance by their attempts to introduce a freer and more polished style of eloquence than had hitherto marked the German pulpit. In regard to the permanent movements of thought, their influence was greatly inferior to that of Michaelis and Semler, whose labors heralded the approach of modern Biblical criticism.

Moses Mendelssohn.

Nicolai.

Liberal theologians.

In history Germany produced at this time at least one writer of high eminence, Justus Möser (1720–94), author of the *Osnabrückische Geschichte* ("History of Osnabrück") and *Patriotische Phantasien* ("Patriotic Fancies"). Möser was the first German historian who wrote a good style and attempted to penetrate to the meaning of events and to present them in the light of great principles. He also produced a strong impression by his enlightened patriotism and by his burning scorn of wrong. Schröck and Schlözer were prominent historians, and the latter made himself known as a clear writer on contemporary politics. Karl von Moser, of Stuttgart, applied to political subjects a faculty for wit and satire that was estimated highly in his own day.

Historians.

Möser.

It has been already stated that the revival of classical study was one of the chief causes by which the mind of Germany was awakened to new effort. Professors Christ and Ernesti, of Leipsic, who were the favorite teachers of many young students, including Lessing, were two of the chief writers to whom this revival was due. Incomparably greater than either, however, was Johann Joachim Winckelmann (1717–68), whose *History of Ancient Art* (1764) opened a new era in the appreciation of ancient life. Later investigation has corrected Winckelmann on many points, but no critic has displayed a keener feeling for the beauty and the significance of such works as came within his knowledge, or a truer imagination in bridging over the gulfs at which direct knowledge failed him. And his style, warm with the glow of sustained enthusiasm, yet calm, dignified, and harmonious, was worthy of his splendid theme. What he did for ancient art was to some extent done for ancient literature by the untiring editorial labors of Christian Gottlob Heyne (1729–1812).

Winckelmann.

Important as were many of these writers, Winckelmann above all, they exercised slight influence on the national mind compared with the three men whom the Germans justly regard as the founders of their classical literature—Klopstock (1724–1803), Wieland (1733–1813), and Lessing (1729–1781).

National literature.

Klopstock stood in direct relation to the Swiss writers. When a pupil at Schulpforta, one of the great Saxon schools which sent forth many of the best authors of the day, he was a diligent student of Bodmer, by whose critical principles he guided himself in reading Homer, Virgil, and Milton. The *Messiah*, on which his fame mainly rests, is now little read, and it is impossible even to glance through it without becoming conscious of glaring faults. Klopstock's genius was essentially lyrical; he lacked the plastic force of imagination necessary for a great epic. His central figure is nowhere presented in clear

Klopstock.

sharp outlines; it wavers between two distinct conceptions, that of a divine and that of a human character. And the facts to which he turns our gaze in the crisis of his narrative are not such as kindle the deepest sympathies; he exhausts the powers of language to convey an impression of the Messiah's sufferings, but we hear nothing of the qualities of soul which these sufferings rouse into action. The subordinate characters are innumerable, and except Abadonna, a repentant fallen angel, between whose character and whose fate there is an effective contrast, none of them can be said to live; they exist only as an excuse for the utterance of Klopstock's feelings. They talk incessantly, weep, embrace, and kiss, but they never do anything that exhibits more than a vast quantity of obtrusive sentiment. Notwithstanding its obvious defects, however, the *Messiah* has qualities which must still command admiration: it reveals a nature full of lofty aspiration and deep humanity, and it contains individual images of striking force and beauty.

It would be difficult to imagine anything more dreary than Klopstock's plays, the subject of three of which is Arminius, while the others deal with scriptural themes. He knew enough neither of life nor of the stage to be a true dramatist; his characters are mere names, and the incidents are grouped according to no principle of art. His odes, which he continued to write from the beginning to the end of his long career, are of far higher excellence. Those which derive their inspiration from Northern mythology are too remote from general sympathy and too obscure in construction to awaken interest; but the stamp of genius is upon several of the lyrics in which he expresses his passionate feeling for the grander phenomena of nature, his ardent patriotism, his enthusiasm for freedom, and his elevated sense of human worth and destiny. Both as an epic poet and as a writer of odes he had many imitators, who, like most others of their class, exaggerated the defects of their model and left his virtues alone. His influence upon the intellectual life of Germany was deep, and, on the whole, beneficent. He encouraged the self-respect of his countrymen, intensified their desire for an independent literature, and by handling high themes, sometimes powerfully, always seriously, suggested that the national imagination would reveal its full capacity only by undertaking greater enterprises than any it had yet attempted.

Wieland. Although Klopstock was one of the central literary figures during two generations, he was not a prolific writer; Wieland, on the other hand, was one of the most prolific of German authors. He was continually at his desk, and in the course of his career produced a considerable library. Of his many works the romantic poem *Oberon* is by far the most famous, and the only one that really pleases modern readers. *Agathon* is perhaps the best of the prose romances in which he endeavored to depict ancient Greek life. He was not endowed with great vividness of imagination, and his prevailing tendency is to extreme diffuseness; but some of his descriptive passages, especially those in *Oberon*, have a touch of ideal grace which enables us to return to them with fresh relish. He had a fine appreciation of style, and by the study of Greek and French masterpieces persistently strove to acquire lightness, clearness, and ease. Even yet few German writers will compare with him in these qualities. In all his works he had a strongly didactic tendency, but his teaching was the opposite of that inculcated by most modern writers who deliberately aim at ethical effect. Above all, he differed from his great contemporary, Klopstock. Writing at first as a strict pietist, he ultimately became a pronounced Epicurean in the popular sense, and made it his object to proclaim an Epicurean theory of life, discouraging enthusiasm, laughing at such aspirations as those of his own youth, exalting the claims of the senses, and placing the highest virtue in kindliness and good humor. This tendency often conducts him to more slippery ground than any on which a German writer of his standing would now venture; but it also gives him innumerable occasions for the play of a gentle and refined irony.

Lessing. Whatever may be the excellences of Wieland and Klopstock, both are essentially writers of the past. This cannot be said of Lessing, the third great German of this period; he is still a living influence. He is, indeed, the only writer before Goethe whom Germans can now read without feeling themselves in a world foreign to their sympathies. Throughout his career he strove to renew and fructify the intellectual life of his nation, and he achieved his aim by important creative activity, and by the clearest, freest, and most drastic criticism of the 18th century.

As an imaginative writer he was chiefly distinguished in the drama, and his most important dramatic work is *Minna von Barnhelm*. If it cannot be said that this is, in the highest sense, a comedy of genius, it is at any rate a comedy which contains elements of permanent interest. The characters are vividly presented; the plot is systematically, yet naturally, unfolded; the dialogue is clear, fresh, and animated. And the work has the high merit of giving artistic shape to elements taken by the dramatist from the living world around him. *Emilia Galotti* is marred by a deep flaw in the conception of the central figure; but every other character in the tragedy is conceived with bold imaginative force, and it is possible for a competent actress to soften, if not to harmonize, even the clashing elements in Emilia herself. No drama making even a distant approach to the excellence of these two plays had been produced in Germany; they thus gave literature in its highest department a fresh start.

But valuable as were Lessing's imaginative creations, they were inferior to his labors as a thinker. Here he was absolutely supreme among his contemporaries; and in some respects he has not since been surpassed. His method is invariably critical, but he aims at rising to the highest, most universal aspects of every subject with which he deals. As a master of style he ranks with the greatest European writers. The structure of his sentences is clear, precise, and compact; and he keeps the mind awake by vivid images drawn from nature and from human life, by interesting, sometimes remote, allusions, by rapid strokes of wit, and by unexpected turns of thought, as if he were abandoning his main theme, while he is in reality indirectly advancing it. He has often been called the most critical of poets; it would be equally just to call him the most poetical of critics.

The greatest of Lessing's purely critical writings is *Laocoon*, a fragment, but a fragment containing the germs of much of the best thought of his own and the immediately succeeding generations. It has an enduring value as the first serious and great attempt to distinguish sharply the realms of art and poetry, and to foster both by subjecting each to its own laws. Next in importance stands his *Hamburgische Dramaturgie*, a series of criticisms on plays represented at the Hamburg National Theatre. By these splendid criticisms, which are based in the main on Aristotle's *Poetics*, with many side references to Diderot's theories, he put an end to the abject submission of dramatic writers to French traditions. In his later years he issued the *Wolfenbüttel Fragments*, portions of a theological work by Reimarus, a deistical writer of admirable force and clearness. He thus became involved in a hot controversy with indignant professors and pastors, the noisiest of whom was Pastor Goeze of Hamburg. The tracts issued by Lessing in the course of this controversy are in form among the most perfect of his writings; they are at once learned, keen, and witty. And in the history of Western thought they are of deep significance. His immediate object was to secure for criticism absolute freedom of movement; but he did very much more. He foreshadowed, as a vital element of the coming time, inquiry as to the origin and growth of the Scriptures, the rise of Christianity, and the fundamental character of religion. And he indicated a far higher standpoint than that of the popular philosophers by vindicating the claims of feeling in spiritual life as opposed to those of the bare understanding. In his *Education of the Human Race* he gave systematic shape to the fruitful principle that a religion which is not true absolutely or for all time may be of vast importance by meeting the needs of a portion of the race in special epochs, and that there is in history, notwithstanding apparent reactions, a progressive movement towards higher intellectual and moral ideals. The suggestions thrown out in controversy he developed artistically in one of the greatest of his writings, the fine dramatic poem, *Nathan the Wise*, a work which enshrines all that was noblest in the struggles and the aspirations of his age, and connects the thought of the 18th with that of the 19th century. As a drama, it has serious faults; but it powerfully effects its purpose by revealing, in the enlightened Jew, its hero, the grandeur of a nature which, instead of binding itself in dogmatic fetters, cultivates a spirit of free and disinterested humanity.

Thus in all directions this great writer labored for the intellectual regeneration of his people. If Goethe, Schiller, and Kant found a nation prepared to receive their work, they owed the fact to many causes; but among these the chief were the political activity of Frederick II. and the literary activity of Lessing.

After the Seven Years' War.

*VII. The Classical Period.*—At the close of the Seven Years' War the conditions of public life were very unfavorable to literature. The country was impoverished, and Frederick the Great and Maria Theresa were almost the only sovereigns who showed the least regard for the welfare of their subjects. But the mind of the nation had been thoroughly aroused from its long slumber. It had been startled into patriotism by Frederick's unsurpassed energy, while the labors of the chief writers had imbued the better part of the middle class with a desire for a more varied and interesting life. As political freedom was still a dream of the future, they turned more and more to books for refreshment and stimulus. Multitudes of young men who in other circumstances would have occupied themselves solely with practical duty became authors, and they urged each other to an activity without parallel in any previous period.

Most of these young writers were deeply influenced by the men of the older generation—Lessing, Wieland, and Klopstock. They were also ardent students of Shakespeare, Ossian, and Dr. Young, poets who were oddly supposed to be on the same level, and to share the same tendencies. Rousseau excited almost as much enthusiasm in Germany as in France, and the criticism of Diderot found many warm admirers. Under these diverse influences a curious movement began which is known as that of "Sturm und Drang" ("Storm and Pressure"). It lasted, from about 1770, for ten or twelve years, and included nearly all the writers who still had fame to win. Their most prominent quality was discontent with the existing world. They detested not only tyranny and superstition but everything which prevented, or seemed to prevent, the free exercise of any powerful impulse. To break down conventionalities appeared to the "Sturm und Drang" poets their true function; but even this did not satisfy them. They longed for some knowledge deeper and more intimate than that attained by science, philosophy, or history, for some emotion intenser than can arise from any known human relation. All these conflicting feelings they expressed in their writings. From slavish submission to French critical laws they were of course completely emancipated. Most of them despised laws of every kind in literature as well as in life, and continually proclaimed that the duty of a man of genius was to write precisely as nature dictated. By "genius" they meant vehement sensations, by "nature" a free use of vigorous epithets.

Sturm und Drang movement.

Herder.

The writer who formed the connecting link between Lessing on the one hand and Goethe and Schiller on the other, and whom the best writers of the "Sturm und Drang" movement regarded as their critical guide, was Johann Gottfried Herder (1744–1803). Herder is sometimes compared with Lessing, but while Lessing has a cosmopolitan touch which makes him intelligible and attractive to all the world, Herder is in the strictest sense a German, and is only slightly studied beyond his own nation. He was less boldly original than his older contemporary, and never attained the clearness, force, and classic beauty of Lessing's style. Nevertheless he is justly ranked among the most distinguished spirits Germany has produced. His mind was receptive in many different directions, and what he absorbed he made his own by independent thought, giving it out in new and suggestive forms. As an original poet, Herder does not rank high; yet genuine poetic impulses are visible in the poem in which he gave shape to the Spanish legends of the Cid. The literature in which he looked for the highest manifestation of thought and feeling was that which appeals to popular sentiment and has its root in popular life. Lessing had already called attention to the songs and ballads of the people; but Herder was the first German who decisively followed the impulse which led in England to the publication of Percy's *Reliques*. In his *Stimmen der Völker* ("Voices of the Peoples") he brought together an admirable collection of the lyrical utterances of many races; and it would be difficult to overrate the service he thus rendered, for he conducted his countrymen to a source of imaginative pleasure and revival in which their literature is exceptionally rich. By far his most important prose work was his *Ideen zur Philosophie der Geschichte der Menschheit* ("Ideas towards the Philosophy of the History of Humanity"), in which, working to some extent on the lines laid down in the brief paragraphs of Lessing's *Education of the Human Race*, he develops the conception of progress, and indicates that we can fully understand any single element of history only by seeing it in the light of human evolution as a whole. This excellent book elevated the aims and enlarged the scope of historic inquiry in Germany; and it still produces a powerful moral effect by its noble spirit of humanity. To the end of his days Herder was animated by a fine enthusiasm for human happiness, and it lights up his pages even when his subject does not lead to its direct expression.

Goethe.

To Herder belonged the high honor of stimulating and directing, at a critical stage, the young genius of Johann Wolfgang Goethe (1749–1832). In naming Goethe we mention the writer who holds in German literature the place held by Shakespeare in the literature of England, and by Dante in that of Italy. He towers high above even the greatest of his contemporaries, predecessors, and successors,—Schiller himself, who is most worthily associated with him, being far inferior in breadth of sympathy and splendor of creative impulse. Goethe, indeed, is one of the few writers who, while marked by strongly national characteristics, belong to the world rather than to a particular country. The special phases of his age have begun to pass away, but his best work has lost none of its freshness; it cannot become old, since it is rooted in elements of human life that eternally endure.

All things co-operated to render worthy of his destiny this favorite child of fortune. During his long life he enjoyed almost uninterrupted physical vigor; he was born into a family of prosperous circumstances, although not so highly placed as to satisfy his ambition; he received the best intellectual training his epoch could afford; in Weimar he was free to adapt the plan of his life to his inclinations; and he appeared at the very time when, by an era of sincere poetic endeavor and unparalleled critical labor, the mind of the nation had been prepared for the boldest efforts of genius. Nature has seldom lavished so many advantages on the greatest of her great men.

The quality in Goethe which immediately arrests attention is the extraordinary range of his activity. Hardly any aspect of human existence was strange to him. He possessed in an unsurpassed degree the faculty of dramatically thinking himself into phases of life to which his personal impulses would not have led him; and he deliberately enlarged his experience by exercising this power at every stage of his career. It was his prevailing conviction that all ideals which fascinate or have fascinated humanity must have a touch of vitality; and none was so remote from him but he sought to penetrate to its meaning. He could be just to Hellenic culture without doing wrong to mediævalism; he appreciated the spirit of Christianity without being indifferent to the faith of the Parsees or the Buddhists; he presented the ascetic aspirations of a "beautiful soul," while setting forth the gaiety of the brightest and most careless tempers; he felt the charm of art at the same time that he carried on profound researches in science; he loved his country, and yet, even when it was overrun by Napoleon's troops, he would not join the patriots in saying a harsh word of France. This absolute universality destroyed enthusiasm for special practical movements; but it gave astonishing variety to his literary achievements. Goethe's was in every respect a thoroughly poetic nature. He could not pass through a profound experience, an image of beauty could not cross his vision, without an accompanying impulse to find for his emotion an adequate sensuous representation. So vast a body of writings as his inevitably includes much that is tedious, but in his happiest moments his genius moved with the ease, the certainty, the calmness of the great forces of nature; he could be as perfect in the lightest stroke of delicate feeling as in the grandest flight of soaring imagination. The world he reflects is the world we actually know; but he is not, therefore, in any narrow sense, a realist. The facts he images are shaped and colored by his thought and feeling; he breathes into them a life by which they are made of universal significance. This combination of realism and idealism is one of the chief secrets of his power. His art aims

at producing the most general effects, yet it is kept fresh, vivid, and true by incessant contact with the concrete life of men.

Heine relates that he felt inclined to address Goethe in Greek, so like was the calm dignified old man to an earthly Zeus; and this is probably the image suggested to most minds by his name. But in youth he was full of eager life, restless, and passionate, and his early works bear the impress of turbulent feeling. Of these the first published was *Götz von Berlichingen*, which instantly established his fame as one of the chief writers of the "Sturm und Drang" school. It is almost as formless as their inartistic writings. The language is sometimes excessively rude, and there is no attempt to combine the different scenes into an harmonious picture. Yet it is sharply separated off from the tasteless plays with which it was compared, for everywhere we find traces of immature power. The characters are alive; they act and react upon each other as we should expect men and women to do in a stormy and troubled epoch; and by a few touches of apparently unconscious art we are made to realize the vital change through which the society of the age of the Reformation was passing. *Die Leiden des jungen Werthers* ("The Sufferings of Young Werther") gave Goethe a European reputation. Much of its sentimentalism now excites smiles instead of tears; but with all its faults it has an enduring fascination. It breathes a warm love of nature, of which it presents vivid pictures; it conveys a powerful impression of the mingled force, sweetness, and unreasonableness of early passion; and it expresses with deep pathos that weariness of life which forms one of the moods of poetic youth, and the manifestation of which was a favorite pastime of the less sincere "Sturm und Drang" versifiers. The promise of *Götz* and *Werther* was not sustained by all the works produced in the first part of his career. *Clavigo* is only a fairly good acting play; and *Stella* has even more than the extravagant sentimentalism of *Werther*, with only an occasional touch of its poetry. On the other hand, it was now that Goethe began *Faust;* and the fragment, *Prometheus*, expresses a grand defiance that is the more impressive because of the deep philosophic thought which may be traced in the background. It was, however, in his lyrics that the richly varied life of Goethe's youth most perfectly revealed itself. There are no German lyrics, if we except Heine's, which deserve to be compared with Goethe's; perhaps none in any literature have a more subtle charm. Profiting by the teaching of Herder, he studied the artless beauty of the best songs of the people, to some of which he gave new form, while retaining their primitive simplicity. His own lyrics are at once popular and artistic; he takes as his themes the joys, the longings, the regrets which all men understand, and weds them to melodies of delightful ease and grace. Almost every poem was suggested by some passing emotion of his own; yet his feeling is so purified that his words become the voice rather of humanity than of an individual man. His ballads are not, as a rule, so powerful as his songs, but both have one quality in common —without elaborate descriptions they continually call up by an apparently accidental word or phrase a clear vision of some natural object or scene. He is equally master of himself in rendering nature as a mirror in which we see the reflection of our own experience, or as a power moving on in calm indifference to our hopes and fears.

In 1775 Goethe settled in Weimar, where Wieland already was, and whither he was ultimately followed by Herder and Schiller, so that the little town became the centre of the intellectual life of Germany. After an interval of ten years, during which he published nothing, he paid his famous visit to Italy. Here his genius was kindled anew, and a close study of sculpture and painting suggested to him the necessity of submitting more fully than he had yet done to the permanent laws of art. The fruits of this experience were *Iphigenia*, *Tasso*, and *Egmont*, all of which he took with him to Italy in an unfinished form. The first two of these dramas were accepted as imitations of the antique; but they are so only in the sense that in each the parts are rigidly subordinated to the intention of the whole, that there is an orderly sequence in the development of the action, and that they are marked by elevation and simplicity of style. While incomparably more finished as works of art than any of the greater works he had before produced, they indicated no falling off in energy of imagination. *Iphigenia*, although its subject is Greek, is in tone and motive altogether Christian; and it would be difficult to name a more attractive picture of a modern lady than the pure and high-minded heroine. In *Tasso* Goethe draws in strong and sure outlines the sorrows of a poetic nature which will not sharply discriminate the real from its own ideal world. This dramatic poem is hardly more remarkable for the truth and vividness of its conceptions than for the charm of its versification and the wealth and beauty of its language. *Egmont*, however, has more movement, and touches human experience at deeper points. Most readers agree with Schiller's criticism, that there is too much melodrama in the closing scene, in which Clärchen appears to the hero as the spirit of freedom, and that, notwithstanding the liberties taken with history, Goethe has hardly succeeded in making Egmont the type of an enemy of despotism. But Clärchen is a beautiful study of a mind stirred by love to great resolves; and there is splendid portraiture in the characters of Alva, William of Orange, and the Princess of Parma.

Meanwhile, a new literary force had revealed itself in the life of Germany: Schiller (1759–1805), Goethe's great rival, had begun to divide with him the public attention and interest. The names of these two poets, in virtue of whose labors their period deserves to be called classical, are indissolubly connected, yet they were marked off from each other by profound distinctions. Goethe is often called the poet of culture, and it is true that he never ceased to subject his powers to systematic discipline. He was also one of the keenest critics of modern times. But the charm of his best writings is not dependent on criticism or culture; it springs from the spontaneous movement of a great imaginative faculty. Schiller, on the other hand, while also endowed with imagination, possessed it in a much less degree. His poetry would probably have lived even if he had not had the advantage of a thorough grasp of æsthetic laws; but it would certainly have had no claim to the distinguished place it now holds in European literature. He did not attempt so wide a range as Goethe, and within his scope he was not, like Goethe, a disinterested observer; he flung himself into the midst of the struggles of his time, and fought valiantly as the champion of a side. Fortunately for Germany, his side was always that of a truly chivalrous mind; for Schiller was one of the most unselfish of men, with lofty aspirations for the race, and a generous confidence in its essential goodness. These qualities determined the character of his conceptions. Goethe presents us with idealized pictures of the world; Schiller's creations are not so much pictures of the world as the figures of a realm distinct from actual life. His supreme aim was to express great sentiments and ideas, and as the medium for their utterance he conceived characters which are to be found only in a poet's dreams.

Schiller.

Schiller began his literary career as a youth of two-and-twenty, inspired by revolutionary ardor, detesting every conventionality of society, dreaming of a world in which will and passion should have absolute license. He relieved himself of his vehement emotions in his first three plays, *Die Räuber* ("The Robbers"), *Fiesco*, and *Cabale und Liebe* ("Intrigue and Love"). Genius never beat with more Titanic energy against an unsympathetic world than in these dramas; the impulse of the "Sturm und Drang" period, as it was about to die away, spoke in them its wildest, most passionate word. *Don Carlos*, his next drama, still manifested inability to form an organic whole; it contains scenes which have no bearing on the central action, and there is hardly an attempt to explain deeds by natural and intelligible motives. But we are no longer in the presence of one who merely raises an outcry against the existing world; furious resistance to despotism has become enlightened enthusiasm for freedom, humanity, and progress. Although the part of Marquis Posa is imperfectly worked into the scheme of the play, he is a nobly ideal creation; through him Schiller pours forth his own aspirations for the welfare of mankind. There is admirable art in the momentary elevation caused by his greatness of soul even in the dark and selfish Philip and the restless and wayward Don Carlos.

After he settled in Jena in 1789 as professor of history, Schiller was often in Weimar; but for a time he and Goethe held apart. By and by they began to approach each other, and from about 1794 their acquaintance ripened into fast friendship. The friendship of Goethe and Schiller is one

of the most beautiful in the history of literature. It made no essential change in Goethe's modes of thought or expression, but it spurred him to the highest activity of which his genius was capable. His friend, he himself declared, "created for him a second youth, and again made him a poet, which he had almost ceased to be." On the other hand, in contact with Goethe's larger intellectual life, Schiller was raised to new points of view, and he acquired for the first time that mastery of artistic methods which secured for him his highest triumphs. He now became as remarkable for the perfection of his form as for the depth and warmth of his feeling.

The two friends worked harmoniously in connection with Schiller's journal *Die Horen*, and wrote in common the *Xenien*, a number of epigrammatic verses meant to wound their literary enemies. On the whole, it is surprising that comparatively so few of the arrows in this rather large quiver are delicately pointed and feathered. A very different stage of excellence is reached by Schiller's well-known ballads, which were written during the period of his intimacy with Goethe. Nearly all of them are marked by force of conception and by purity and dignity of style. In lyrical poetry he had acquired some distinction before he knew Goethe, but it was in competition with his friend that he achieved his masterpiece, *Das Lied von der Glocke* ("The Song of the Bell"), in which within a small compass he presents an impressive picture of the course of human life, varying his melody with subtle art to suit the changing aspects of his theme. Less artistically perfect than the *Glocke*, other lyrics, such as *Der Genius*, *Die Ideale*, *Der Spaziergang*, have the power which belongs to deeper personal emotion. In ease and spontaneity none of Schiller's lyrics equal Goethe's, in which, as Heine says, "the word embraces you while the thought kisses you." But they express in clear and noble language some of the highest feelings excited in a poetic mind by contemplation of human life and destiny.

In his dramatic writings Schiller was influenced by Goethe even more than in his lyrics and ballads. The whole series of tragedies which he now wrote have historic or legendary themes, and he displays remarkable skill in unfolding through the past his greatest ideas respecting the future. At the same time he evokes from it a company of finely ideal figures, whose qualities are revealed by the systematic development of large and carefully conceived schemes. *Wallenstein*, the earliest of the series, consists of two plays, *The Piccolomini* and *Wallenstein's Death*, the former of which is preceded by a number of scenes presenting a vivid picture of Wallenstein's camp. The tragic motive of this great work is somewhat obscure. We are made conscious by many artful touches of the ultimate issue; but Schiller does not render fully intelligible the play of the influences which result in disaster. There is however, high imaginative faculty in his conception of Wallenstein's powerful, dark, and wavering character; and every reader feels the charm of the love passages between Max Piccolomini and Thekla. In *Maria Stuart* Schiller triumphs over an obvious difficulty by admitting the heroine's guilt, while he stirs our pity for her sufferings and our admiration for the spirit of endurance with which they are met. In the *Jungfrau von Orleans*, "The Maid" would have given purer pleasure if she had not been represented as loving one of the English commanders; but this only slightly mars the splendid picture of her patriotic devotion. As a work of art, the *Braut von Messina* is the least successful of the later dramas, for it attempts to combine romantic and classic elements which are irreconcilable; it contains, however, some of the most brilliantly rhetorical passages in the German language. The last of his completed works, and in some respects the best, was *Wilhelm Tell*. Here his love of freedom shaped for itself forms of immortal beauty. At a time when the French emperor threatened the independence of all Europe, men felt the power of the play more keenly than can be done in a calmer period; but it has permanently enriched the life of humanity by its conception of a character dominated by high, ideal passions. Schiller never saw Switzerland, yet in this powerful drama he renders with astonishing vividness the grander effects of Alpine scenery.

Goethe's ballads.

During his friendship with Schiller Goethe wrote in competition with him many lyrics and ballads. In works of the latter class, as Goethe himself thought, he was surpassed by his friend. He is incomparably more subtle and suggestive than Schiller; but for this very reason he is less effective. A ballad does not deserve its name if it is not popular; and we hear the voice of the people themselves in Schiller's free, bold, and simply harmonious verses. One of the longer works published by Goethe during this period was *Hermann und Dorothea*. His delicately chosen language and dignified hexameters are not always in keeping with the somewhat prosaic life they are here used to portray; but the poem is the nearest approach that has been made to the successful epic treatment of an ordinary theme. And it rises to a high level of imaginative power in the contrast it suggests between the still life of the humble village, with its little idyll of satisfied love, and the far-off desolation of the revolutionary wars, of which we are reminded by the band of emigrants. The genius of Goethe moves more freely in *Wilhelm Meister*, of which the first part was now published. This work has perhaps given rise to more contradictory criticism than any other book in modern literature. We may safely disregard the opinion of those who find in it all the excellences that can be combined in a prose romance, for it is without plan, and its style is singularly unequal. When Goethe himself admitted that he did not possess the key to its full significance, his warmest admirers may allow that perhaps there is no key to possess. Yet few of his writings present more striking evidence of the fertility of his power. He interests us equally—to recall only a few of the characters—in the gay and worldly Phillina, in the romantic Mariana, and in that most mysterious, lovely, and fascinating of creations, Mignon, whose *Kennst du das Land* is perhaps the noblest of those pathetic poems in which a soul in an uncongenial world calls up a momentary vision of its true home. It is not only in its dramatic conceptions that *Wilhelm Meister* is great; it contains some of Goethe's deepest thoughts on life and literature.

Hermann und Dorothea.

Wilhelm Meister.

After the death of Schiller, Goethe turned his attention more and more to science, his achievements in which have been fully appreciated only since the growth of the doctrine of evolution. Still, it was in his latest period that he completed the most famous and the greatest of his works, *Faust*, a poem which he began in youth and did not finish until nearly his last birthday. The Faust of legend was a vulgar magician. Goethe so conceives the character that it indicates the deepest mysteries of human existence. The second part, in which the problem of the poem is solved, can hardly be regarded as a work of art; it is, or seems to be, confused and dark. And the individual elements of the first part are not completely welded; they form rather a series of poems than a single creation. In these individual elements, however, we find the grandest sweep of imaginative thought yet achieved by the German genius. The episode of Gretchen reflects with perfect art the most alluring and the most sorrowful facts of life; and philosophy and religion in their highest aspects meet in Faust's aspirations and struggles.

Faust.

It might have been supposed that at the age of seventy Goethe had no new imaginative worlds to conquer; yet he then published his *Westöstlicher Divan*, representing, with dramatic sympathy and lyric force almost unabated, the combined mysticism and sensuousness of Oriental life. Ten years before, he had issued *Wahlverwandtschaften* ("Elective Affinities"), a powerful picture of impulses which law cannot control, and in which are concealed the germs of tragic issues. It has, however, less charm than another prose work, *Dichtung und Wahrheit* ("Poetry and Truth"), in which he draws a slightly idealized sketch of his early life. This fascinating book has made the figure of young Goethe as familiar as his chief dramatic characters; and no creations of the fancy are better known than the Frederikas and the Lilis, who had long before occasioned his sweetest lyrics, and the memory of whom in old age gave delicacy and music to his style.

Goethe's latest writings.

While Goethe and Schiller were in the midst of their career, Europe was startled by the French Revolution. At first it stirred as much interest in Germany as in England. The aged Klopstock greeted it with odes full of the fiery energy of youth, and for a time Schiller almost fancied that his loftiest hopes were about to be realized. Sympathy, however, was transformed into bitter opposition by the Reign of Ter-

French Revolution.

ror; and when Germany was trodden under foot by Napoleon, she turned more and more from every kind of French influence. Thus it happened that, although the ideas of the Revolution have indirectly affected the literature of Germany as deeply as that of the rest of Europe, their immediate effect was slight and transitory.

Kant. An event of the highest importance in the intellectual growth of Germany was the publication, in 1781, of Kant's *Kritik der Reinen Vernunft.* It is hard for men of a later time, accustomed to metaphysical speculation, to realize the impression produced by this great book. Its effect in philosophy was not unlike that caused in our own day in science by Mr. Darwin's *Origin of Species.* Everywhere among thoughtful men, at the universities especially, philosophy became the absorbing subject of study; and it was taken up at a point from which its whole past development was for the first time intelligible. Goethe, without neglecting the movement, was perhaps less stirred by it than any other prominent writer; Schiller became one of Kant's most enthusiastic students, and traces of the new system are to be found in many of his later lyrics and dramas. He also applied its principles to æsthetics in several admirable critical writings. By and by, dissatisfied with the gulf left by Kant between mind and matter as "things in themselves," philosophers started in search of some principle which should harmonize all the elements of existence; and thus grew up, one after the other, the systems of Fichte, Schelling, and Hegel. For more than a generation these thinkers excited deeper interest than imaginative writers; the most serious minds were fascinated by speculations which placed in new lights all the greatest questions relating to human thought and action.

Sturm und Drang poets. Of the poets or versifiers who began their career with Goethe, the one who for some time attracted most notice was Klinger (1753–1831), whose play, *Sturm und Drang,* is at least memorable through its title. Other plays of his were *Conradin* and *Medea;* and he also wrote romances, of which the best known were *Faust's Leben, Thaten, und Höllenfahrt* and *Der Weltmann und der Dichter.* His writings are violent and noisy, without a touch of true art; what he mistook for imagination was a power of crude and unmeasured declamation. His later works express the bitterness of a deeply disappointed man. Lenz (1750–92), whose name is usually connected with that of Klinger, did not even make so distant an approach to imagination as his rival; his plays are the wild outgrowths of a mind which has made no sincere observation of life, and has submitted neither to intellectual nor to moral discipline. A man of much greater talent than either was Daniel Schubart (1739–91), the restless, licentious, and unfortunate poet who, for publishing a piece of false news, was confined for ten years in a fortress, where he suffered incredible hardships. In his attempts to portray the horrible he is sometimes extremely grotesque, but his best verses have both music and pathos, and they had the good fortune to exercise some influence on Schiller. He was one of the earliest publicists of Germany, and his hatred of despotism was the real cause of the infamous act which deprived him of freedom. Writers who shared the spirit of "Sturm und Drang," and applied it in new directions, were Lavater and Basedow. Lavater enjoyed the friendship of nearly every distinguished man of his day, yet he was vain and fanatical. His *Physiognomische Fragmente* ("Fragments on Physiognomy") were supposed by thousands of readers to find in the relations of mind and body the materials of a new and mysterious science; but the pretended science was in reality a mixture of commonplace and extravagance. Basedow, although with too passionate a faith in the power of education to effect an immediate transformation of the race, did excellent service by advocating, after Rousseau, a more humane and natural system of mental training than had before prevailed. The same cause was more temperately promoted by Campe, who wrote some admirable books for the young; and the Swiss educational reformer, Pestalozzi, set forth methods of instruction in earnest didactic works which had some effect in nearly every country in Europe.

Hainbund or Göttingen school. The excitement of the "Sturm und Drang" writers was shared by a band of young poets who in other respects displayed a wholly different temper. Most of them were students at Gottingen, where they gathered round Boie, editor of the *Musenalmanach,* a journal he had started in imitation of *Le Mercure de France,* and to which Goethe and many of the best of the younger men of the day contributed. They called themselves the "Hainbund" ("Grove confederation") because of their dancing one night by moonlight roun an oak tree, swearing eternal friendship, and vowing to devote themselves to their native land. The god of their idolatry was Klopstock, whose somewhat fantastic enthusiasm for primitive Germany they fully shared, and whose labors on behalf of virtue they never ceased to celebrate, while they loathed and despised Wieland. Several members of the "Hainbund" afterwards acquired distinction, and all of them were more or less remarkable for the genuinely popular tone of their writings. By far the greatest of them was Bürger (1748–94), who although he never did full justice to himself, gave evidence of an original and adventurous genius. His *Lenore,* a translation of which was Scott's first published work, is full of weird power, and his sonnets are among the most perfect in German literature. His faculty of meeting the popular taste was possessed by Hölty (1748–76), who, however, delighted in mild and calm expression, while the best of Bürger's poems are full of stir and action. Johann Martin Miller (1750–1814) became known chiefly as the author of the romance *Siegwart,* a rather weak imitation of *Werther.* Some irreverent spirits ventured to laugh at its tedious pathos, but it was welcomed by the majority of the middle class, who took especial delight in the songs it includes. Christian, Count Stolberg, and his brother, Frederick Leopold, were also members of the Göttingen school. Besides imitations of Greek plays, they issued odes, ballads, and songs. Of the two the most powerful was Frederick Leopold (1750–1819), in some of whose briefer pieces there is true feeling for nature. He continually verges, however, on extravagance, and often takes the fatal step from the sublime. A stronger writer was Johann Heinrich Voss (1751–1826), author of a famous idyll, *Louise,* which was received by Schiller as a poem of first-rate importance, and suggested to Goethe the idea of his *Hermann und Dorothea.* Its homeliness of style is perhaps more in keeping with its simple and commonplace theme than the classic grace of Goethe's verses. Voss acquired a better title to fame by an admirable translation of Homer, which did for the *Iliad* in Germany what Pope's translation did in England. Voss's rendering is less polished than Pope's, but incomparably more faithful. Matthias Claudius (1740–1815), although not a member of the "Hainbund," is usually associated with it because of his general sympathy with its tone. The *Wandsbecker Bote* ("Wandsbeck Messenger"), in which he brought together all his writings, contains much simple poetic feeling, and some of his songs are still popular favorites.

Bürger. Voss. Claudius.

Imitators of Wieland. While these writers attached themselves to Klopstock, others showed traces of Wieland's influence. The most important of this class was Wilhelm Heinse (1749–1803), whose chief work was *Ardinghello,* a prose romance. He shares Wieland's general theory of life, but, instead of expressing it in the calm, ironical style of his master, he is vehement, tumultuous, and enthusiastic. Amid his wild exaggerations he sometimes displays a remarkable power of describing physical beauty. He was an ardent student of art, and was the first German writer who succeeded in reproducing in glowing language the impression produced upon him by pictures and music. Other imitators of Wieland were Aloys Blumauer, who mistook vulgar burlesque for satire; Alxinger, whose *Doolin von Mainz* may be taken to represent a large class of tiresome poems of chivalry; and Von Thümmel, who, with considerably more ability than these writers, spoiled his good qualities by cynical grossness.

Imitators of Goethe and Schiller. An indefinite number of mediæval plays were written in imitation of Goethe's *Götz,* and robber romances in imitation of Schiller's *Räuber.* Of the latter the earliest and most famous was the *Rinaldo Rinaldini* of Vulpius. Jung Stilling (1740–1817) continued the sentimental tone of *Werther* in a number of curious autobiographic tales, which acquired extraordinary popularity, and threw much light on the inner tendencies of the later pietists. Among imitators of Schiller's lyrical poetry the best were Matthison and Salis-Seewis; but they were more successful in reproducing his moral feeling than in rivalling his high art. For many

years the stage was in the possession of Iffland (1759–1814) and Kotzebue (1761–1819). The former, who was a distinguished actor, wrote dramas chiefly of domestic interest. They are without genius, but had the merit of almost displacing the foolish mediæval plays of Goethe's imitators. Kotzebue was a most prolific writer; and although he had no imagination, and wrote merely to catch the applause of the moment, his comedies still deserve to be named among the few works of this class which have hitherto been produced in Germany.

Jacobi. A writer who exercised some influence over the youth of Goethe was Frederick Jacobi (1743–1819). He was the author of two romances, *Alwill* and *Woldemar*, in both of which there is a little of Werther's sentimentalism, although their main purpose is didactic. He also wrote a number of philosophical works. His main principle is that the sources of religion and morality are to be found in intuition; and by a constant reiteration of this doctrine he worked in opposition to Spinoza, to Kant, and to Schelling. There are occasional gleams of philosophical genius in Jacobi, and he is of some interest to English readers because of the attention Sir William Hamilton appears to have devoted to his writings.

Richter. An author of a very different type, and of far greater eminence, was Jean Paul Richter, usually called Jean Paul (1763–1825). It is difficult to do justice to Jean Paul, for he commits almost every fault of which a writer of romance can be guilty; he is at different times pedantic, extravagant, sentimental, and tedious. He prescribed for himself no limits; everything that occurred to him at the moment of his writing went down exactly as it suggested itself. Yet it is impossible even to look into any of his innumerable books without recognizing his genius. The work which has maintained the strongest hold over the nation is perhaps his charming prose idyll, *Die Flegeljahre* ("The Years of Wild Oats"); but his great romance, *Titan*, and the less ambitious *Siebenkäs*, or "Flower, Fruit, and Thorn Pieces," have also kept their place as works of permanent excellence. The most admirable quality of Richter is his humor. No German writer plays with his subject more delightfully, and he produces his most striking effects in dealing with the simplest, most unpretending relations of life. He is usually very near the sources of pathos when he smiles, and Jean Paul's pathos, at its best, is full of power, awakening the deepest feeling by its obvious sincerity. Sometimes it is associated with lofty imagination, as in the famous dream in which he describes a universe without religion. His feeling for the periodic changes of season in nature is that of a poet in the highest sense, his descriptions of spring being perhaps unsurpassed for their glowing yet tender beauty. To his other excellences we must add the manly spirit which led him to scoff, occasionally without due measure, at every kind of vulgarity and pretence, and at the same time preserved in its original freshness his sympathy with his fellow-men and his passion for their enlightenment and progress.

Romantic school. The most important literary movement which originated during the lifetime of Goethe was that of the Romantic school, whose leading members at first attached themselves to him, but gradually diverged more and more from his spirit. The rise of the school was in some measure due to the philosophy of Fichte, whose theory of the ego as the principle which freely creates its own world gave new importance to the individual as opposed to law and convention. Schelling still more effectually prepared the way for the Romanticists by his poetic treatment of the relations between the mind and nature; and several of his disciples, especially Steffens, worked in the same direction by dwelling on the possibilities of mystery in human life and in the external world. The aim of the Romantic school was to assert for modern feeling the right of a freer, more varied utterance than can be provided for it by the forms of classic literature. They were not in sympathy with their own time; they found it tame, prosaic, colorless; and to enrich it with new elements they went back to mediævalism, in which, as they conceived it, daily life had not been divorced from poetry. They drew enthusiastic pictures of the Middle Ages, of the charms of chivalry, of the loyalty of each class to the class above it and to society as a whole, of the devout piety which was supposed to regulate the conduct of prince and peasant alike, and which revealed itself in splendid architecture and a gorgeous ritual. With a like purpose the Romanticists pointed to Oriental life, and began the serious study of Sanskrit and Persian poetry. The chief writers whom they opposed to the classical poets both of antiquity and of modern times were Shakespeare and Calderon; but they also brought to light many mediæval authors who had previously been neglected, and stimulated the Germans to a systematic study of the whole of their past literature.

The Romanticists did not strike out a wholly original path, for there were in the writings of Lessing, Goethe, and Schiller—especially of Goethe—elements in full harmony with all that was best in the new tendency. They were guilty of grotesque exaggeration in their descriptions of the superior happiness of mediæval nations and Oriental peoples, and they did much harm by checking the rising appreciation of measure and order in literary form which had been encouraged by the great classical writers. In practical life, too, their labors led to results opposed to the progressive tendencies of the age; for in the case of many adherents of the Romantic school, enthusiasm for the Middle Ages soon ceased to be a mere literary fancy—they strove to reproduce obsolete mediæval ideas. Large numbers of them joined the Catholic Church, and became the most vehement opponents of spiritual and political freedom. Still the Romanticists gave prominence to certain vital principles. That we now feel the charm of what was great and beautiful in the Middle Ages, is in part the result of their teaching; and to some extent we owe to them the recognition of deeper elements in the world than reason can formulate, and the conviction that the thought of each age must create for itself a medium of expression adapted to its special nature.

Novalis. The writer known as the prophet of the Romantic school was Frederick von Hardenberg, generally called Novalis (1772–1801). In his unfinished romance, *Heinrich von Ofterdingen*, he revealed a mystical and sensitive spirit, penetrated by religious aspiration, and feeling itself ill at ease in the hard rough world. These qualities are still more pathetically expressed in his poems, the best perhaps being those in which he directly utters spiritual emotions. The critical leaders of the school were the brothers August Wilhelm von Schlegel (1767–1845) and Friedrich von Schlegel (1772–1829). It is to be feared that many English readers have derived their impression of the former mainly from Heine's malicious caricature. In reality, although destitute of creative power, he was a man of great intellectual distinction. His translations from Shakespeare are masterly, and his rendering of Calderon has also genuine merit. He did much to promote the scientific study of Sanskrit, and his lectures on dramatic art and literature, and on the theory and history of plastic art, contain many fruitful suggestions. Friedrich von Schlegel, who was a writer of greater depth and versatility than his brother, caused much scandal by his romance, *Lucinde*, in which the school appeared for the moment as a powerfully dissolving force in regard to the most sacred of human relations. His most important work, however, is his *History of Ancient and Modern Literature*. Throughout his exposition he is a propagandist of his special ideas; but the book is of lasting importance as the earliest attempt to present a systematic view of literary development as a whole. The period in which the brothers worked most effectually for their school was between 1796 and 1800, when they lived in Jena, and formed the centre of a brilliant circle which included Fichte, Schelling, Tieck, and Wilhelm von Humboldt. Here they edited the *Athenæum*, in which they chastised feeble and pretentious writers, and awoke general interest in mediæval art and literature, and in the systems of philosophy that harmonized with their special tendency.

The brothers Schlegel.

Tieck. The most productive, and for a time the most famous, writer of the Romantic school was Ludwig Tieck (1773–1853). Many of the smaller tales in his *Phantasus* have not yet lost their interest. They are, indeed, as far as possible from representing the real life of mediævalism, but they have a mystic and fairy-like charm which is not the less powerful because it is purely imaginative. In his later novels he took his themes from modern life, and they display a remarkable talent for keen and searching satire. Most of them, however, are already practically forgotten, for Tieck was unable to give form to his ideas, and his imagination was wayward and eccentric

In his lyrical poetry he seldom touches a true note, and his dramas have no high qualities to make up for their utter and deliberate lack of plan. Yet his dramatic criticism, of which he wrote a great deal in Dresden—where he lived for many years, the centre of an adoring body of disciples—is often happy and suggestive; and his completion of Schlegel's translation of Shakespeare is poetic in feeling, and indicates a rare mastery of language and versification. A writer of less importance, but who exercised considerable influence over Tieck at an early period of his career, was

Wackenroder.

W. H. Wackenroder (1772–98), whose *Phantasien über die kunst* ("Fancies concerning Art") was published by Tieck after the writer's early death. Both in this book and in his *Overflowings from the Heart of an Art-loving Friar* he expresses a deep feeling for Christian, especially allegoric, art. He was here in full sympathy with the whole Romantic school, which derived intense delight from the spiritual art of the early mediæval painters, but cared little for the noble beauty of Greek art or of the art of the Renaissance.

Among the authors who wrote in the spirit of the Romantic school, and who were for a long time extremely popular, one of the chief was E. T. A. Hoffmann (1776–1822). His treatment of ghostly and horrible themes is often very grotesque; but he has flashes of vivid narrative which indicate a deep appreciation of some of the more mysterious aspects of human nature. Clemens Brentano (1777–1842) was one of the most ambitious of the Romanticists, and he had originality both of thought and fancy; but he was too confused, too indifferent to form, to produce more than a passing impression. Of far more enduring excellence than anything he himself wrote was *Des Knaben Wunderhorn*, a book of popular lyrics which he collected with his brother-in-law, Achim von Arnim. Arnim (1781–1831) revealed imagination and feeling in his *Kronenwächter* ("Guardians of the Crown"); and his *Countess Dolores* gives evidence of great natural power. His works, however, suffer the penalty which attaches to the total neglect of art. De

Fouqué.

La Motte Fouqué (1777–1843) does not, in the majority of his writings, rise above the level of his fellows; like them, he usually lacks clearness, precision, and genuinely human interest. But in one little book, *Undine*, he achieved a masterpiece. This charming tale, with its sweetness, pathos, and dream-like beauty, is now above criticism; it has taken its place as one of the select class of creations which appeal to all the world, and do not depend for their popularity on the tendencies of a particular time. Joseph von Eichendorff (1788–1857) is an adherent of the Romantic school only in some of his tales; his lyrics combine its depth of emotion with clear and musical expression, and his best stories are written in a frank and attractive style. Adelbert von Chamisso (1781–1838), although usually classed as to some extent a Romanticist, has none of the dreaminess and mysticism of the school. He became a German both in thought and feeling; but his ordered and vigorous style presents many traces of his French origin. He is now chiefly remembered by *Peter Schlemihl*, a tale of quaint and suggestive humor. The most distinguished dramatist of the Romantic school was Heinrich von Kleist (1776–1811), whose dramas were not represented till after his death, but have since then attracted much attention. Some of his characters are conceived with great vigor, but in his tragic motives he lacks invention, and all his works are more or less marred by morbid sentimentalism. Allied to the Romantic school, although not directly connected with it, were the writers

Fate-Tragedy.

of the so-called fate-tragedies. The originator of this curious class of works was Werner (1768–1823). It would be difficult to imagine a more trivial conception of fate than that which he develops in his *Twenty-Fourth of February*, which represents a series of disasters as occurring at intervals on a particular day in consequence of a father's curse. The notion, however, struck the popular fancy, and for ten years even Kotzebue could not contest the supremacy of the fate-tragedians. The chief followers of Werner were Müllner and Houwald. Franz Grillparzer (1791–1872) began his career with a play—*Die Ahnfrau* ("The Ancestress")—in the style of these popular writers, but in his later tragedies he strove to attain classic force and dignity; and by at least one play, *Sappho*, he achieved a place among the most distinguished German dramatists.

The whole life of Germany was to some extent influenced by the Romantic school. In politics it was represented, among others, by Joseph Görres, who agitated with constantly growing enthusiasm for the revival of mediævalism both in church and state. In philosophy Franz Xaver von Baader followed a like tendency by entering deeply into the spirit of Jacob Boehme's mystical philosophy, and interpreting its principles in accordance with Catholic doctrine. Frederick Schleiermacher (1768–1834) was a thorough Protestant, and his services to serious literature were incomparably higher than those of Baader. He was an admirable dialectician, and did more than any other writer to promote in Germany a sympathetic study of Plato. Yet there is a touch of Romanticism in the vague, shadowy, and mystic language in which he presents the elements of Christian thought and life. The love of the Romantic writers for previous epochs of German history and literature led to the great researches of the brothers Grimm, who founded the scientific study of the German language and of German antiquities. They were followed by many devoted scholars, among whom may be named Beneke, Lachmann, Moritz Haupt, and Franz Pfeiffer. The Oriental studies of the Romanticists also promoted comparative philology, which acquired something of the character it now bears through the labors of the illustrious scholars, Wilhelm von Humboldt and Franz Bopp.

Influence of Romantic school.

Schleiermacher.

Philological writers.

During the calamitous period when Germany was beaten and humbled by Napoleon the Romantic school, by continually recalling the past glories of the nation, contributed largely to the revival of patriotic feeling. A like result was achieved by Fichte, whose addresses to the German people, delivered in Berlin while it was occupied by French soldiers, are models of fervid yet thoughtful and dignified eloquence. In the war of liberation the popular excitement was expressed with great spirit by Theodor Körner (1791–1813) and Ernst Moritz Arndt (1769–1860). Of these two writers Arndt is the most poetic, but few even of his lyrics have much literary value. To judge them fairly we must think ourselves back into the epoch in which the nation spontaneously arose to avenge its wrongs and assert its independence. It was as a writer of patriotic war songs that Frederick Rückert (1789–1866) opened his career. Afterwards he moved over a wide range, distinguishing himself especially as a translator of Oriental poetry. He was master of almost every form of lyrical expression, and had hardly less facility in narrative and didactic verse. As regards the substance of his poetry, he is perhaps chiefly remarkable for the tone of calm resignation which he learned from his Eastern masters. In his preference for Oriental modes of thought he has been followed in recent times by Daumer, Bodenstedt, and other poets, who, however, chiefly aim at contrasting the ascetic ideals of Christianity with a gayer, brighter, scheme of life. The whole movement had its origin, and was virtually exhausted, in Goethe's *Westöstlicher Divan*.

Patriotic writings.

Rückert.

Had the hopes of German patriots been realized after the war of liberation, literature might have profited by the growth of an intelligent national spirit. But the reward of the German people for their immense sacrifices was bitter opposition on the part of their Governments to every aspiration for freedom and unity. Arndt himself, who had done so much to kindle patriotic ardor, was dismissed in disgrace from his professorship at Bonn, which he did not regain till 1840, when Frederick William IV. mounted the Prussian throne. And the brothers Grimm with other scholars were ignominiously turned out of Göttingen. The mass of the people lost interest in high thought and endeavor, and nourished itself on weak poetry like the *Urania* of Tiedge, and detestable novels like those of Clauren. Yet even in poetry the period was not destitute of important names. Ludwig Uhland (1787–1862), whose first volume of poems appeared in 1815, ranks with the greatest of modern lyrical writers. He is truly popular and patriotic in tone, yet his songs and ballads have an ease and grace of style which raise him far above any of the Romantic school. Uhland was the founder of the so-called Swabian school of poets, of whom the most cultivated was Gustav Schwab. Other Swabian poets were Justinus

War of liberation.

Uhland.

Swabian school.

Kerner, who attempted, not unsuccessfully, to combine pathos and humor, and Eduard Mörike, whose poetry is generally of a melancholy tone, relieved, however, by touches which indicate a fine sympathy with nature. The theatre was dominated by Raupach (1784–1852) and Freiherr von Auffenberg (1798–1857), the former reigning in Berlin, the latter in Carlsruhe. Both had talent and knowledge of the stage, but there is neither genius nor art in their plays. Immermann (1796–1840), although not without poetic power, lacked the faculty of controlling his dramatic conceptions. He was more successful in romance—his *Epigonen*, and still more his *Münchhausen*, displaying vivid fancy and a quaintly original humor. Sir Walter Scott, who was deeply influenced by German literature, repaid his obligations by influencing it in turn. One of the best of his imitators was Wilhelm Hauff (1802–1827), who had the merit of nearly putting an end to Clauren's popularity by satirizing his style. Hauff's chief work was *Lichtenstein*, which excited hopes that were too soon extinguished by death. Wilhelm Häring, known as Willibald Alexis (1798–1876), also began as an imitator of Scott, but he afterwards wrote more original historical romances, the scenes of which he laid in Brandenburg. Johanna Schopenhauer, mother of the philosopher, was considered in her day an attractive writer of romance, but she is now remembered only for the sake of her son. She was surpassed in vigor of thought and style by Caroline Pichler (1769–1843), who wrote several well-known historical novels.

History. Throughout the whole of this period Germany maintained her eminence in classical study, contributions of the highest importance to the knowledge of ancient life being made by Wolf, Hermann, Boeckh, and Otfried Müller. In history she produced several writers of distinction. Spittler (1752–1810) was a worthy successor of Justus Möser in the free and artistic treatment of historical subjects; in youth he was kindly treated by Lessing, whose clear style he appears to have taken as his model. Johannes von Müller (1752–1809), the historian of Switzerland, used to be considered by the Germans an eloquent writer, almost a prose poet, but he is now generally regarded as an affected rhetorician. Raumer, in his chief work, *History of the Hohenstaufen*, gave forth the results of deep research in an animated and vigorous narrative. Schlosser, author of a *History of the Eighteenth Century*, was also an historian who combined purity and strength of style with learning. Niebuhr, in his *Roman History*, pushed his scepticism too far, but he profoundly modified opinion in regard to the tests of historic credibility.

VIII. *The Latest Period.*—With the death of Goethe in 1832 began a new era in German literature, an era not yet closed. The period has been one of intense political excitement. In 1848 the national aspiration for freedom nd unity found decisive expression in action; since that time Germany has achieved unity by the sword, while she still slowly feels her way towards freedom. It was inevitable that in such an epoch much of the best energy of the nation should be devoted to politics, but there has also been great literary activity—activity deeply influenced by the practical struggles, hopes, and fears of the time.

Philosophy. Philosophical speculation has been continued without interruption, and in many respects it has been, and still is, the deepest current in the intellectual life of Germany. From 1818 till his death in 1831, when he was a professor in Berlin, Hegel dominated the highest thought. His vast system, in which he attempted to explain the ultimate facts of the world and to bind by a chain of deductive reasoning the elements of all knowledge, found enthusiastic adherents among the more ambitious of the younger literary men, and for many years after his death it determined the character of their work. Gradually, however, the school broke up into three distinct divisions, the right, the centre, and the left. Of these the most active were the members of the latter party, who interpreted Hegel's doctrine in a revolutionary sense. Arnold Ruge, one of the most brilliant writers of the school, applied Hegelianism to politics, in which he associated himself with the extreme radicals. David Friedrich Strauss, who also started as a follower of Hegel, in his memorable *Leben Jesu* resolved the narratives of the Gospels into a series of myths, and found the vital element of Christianity in its spiritual teaching. Feuerbach, going still further, warred against all religion, urging that it should be replaced by a sentiment of humanity.

School of Hegel.

While the different sections of Hegelians opposed each other, Schelling developed the later phases of his system; and thought was turned into a new channel by Herbart, whose psychological work has been carried on at a later time by Lotze. Krause also attracted attention by philosophical ideas through which he aimed at solving the practical difficulties of modern life. Ulrici and the younger Fichte have exercised considerable influence as the advocates of a pantheistic doctrine by which they endeavor to reconcile religion and science. None of these names, however, have the importance which attaches to that of Arthur Schopenhauer, who, although his chief book was written in the lifetime of Goethe, did not secure a hearing until long afterwards. At the present time he stirs deeper interest than any other thinker. German philosophers have, as a rule, been utterly indifferent to style, but Schopenhauer's prose is clear, firm, and graceful, and to this fact he owes much of his popularity. He expressed bitter contempt for his philosophical contemporaries, and, going back to Kant, claimed to have corrected and completed his system. His main doctrine is that will is the fundamental principle of existence; but his importance arises less from his abstract teaching than from his descriptions of the misery of human life. History seemed to him but a record of turmoil and wretchedness; and there is high literary genius as well as moral earnestness in his graphic and scornful pictures of the darker aspects of the world. Eduard von Hartmann, the latest original philosopher of Germany, works on essentially the same lines, but seeks to reconcile Schopenhauer not only with Hegel and Schelling but with Leibnitz.

Schopenhauer.

The growth of science has been one of the most powerful factors in the recent intellectual development of Germany, and some of the best books of the period have been works presenting in a popular form the results of scientific labor. Among these the first place still belongs to the *Cosmos* of Alexander von Humboldt. Its fundamental conceptions are no longer in full accordance with the best thought; but it is made enduringly impressive by the writer's power of handling vast masses of facts, by his poetic feeling for the beauty and the order of nature, and by the purity and nobility of his style. Some of the greatest men of science, such as Liebig, Virchow, and Helmholtz, have also made admirable attempts to render their subjects intelligible and interesting to ordinary readers. Büchner and Vogt have considerable merit as popular scientific authors, but their writings are marred by a polemical tendency which induces them to dogmatize on metaphysical questions beyond their proper range.

Science.

Humboldt.

In historical literature Germany has recently produced many eminent writers. The historian who enjoys the widest popularity is Leopold Ranke, who has instructed two generations by communicating in an agreeable style the results of extensive research in many different fields of inquiry. Gervinus acquired a permanent place as an historian by his excellent *History of the Nineteenth Century*. Works of high value have also proceeded from Giesebrecht, who has written on the Holy Roman Empire with enthusiastic appreciation of the great emperors; from Droysen, the diligent historian of Prussia; from Dahlmann, whose labors included German, English, French, and Danish history; from Häusser, whose masterpiece is an elaborate history of Germany since the death of Frederick the Great; from Waitz, the chief authority on the growth of the German constitution; from Sybel, by whose researches much new light has been thrown on the French Revolution; from Mommsen, the vigorous historian of ancient Rome; and from Curtius, whose history of Greece is not more remarkable for its learning than for the clear and attractive arrangement of its materials. Of late years much attention has been devoted to "Culturgeschichte," which describes the life of a people in all its phases, either through the whole past or during a particular epoch. A favorable example of works of this class is Karl Biedermann's *Germany in the Eighteenth Century*.

Historians.

Recent German literature is extraordinarily rich in histories of the individual elements of intellectual development. In its histories of philosophy it is absolutely supreme. Hegel still ranks as one of the greatest historians of philosophy, although the value of his expositions is lowered by a tendency to find his own doctrine in preceding thinkers. Erdmann, Schwegler, and Ueberweg were among the most important workers in the same department; and with them

may be named Kuno Fischer, who writes the history of philosophy with a striking power of sympathetic appreciation and in a fascinating literary style. Less attractive in manner than Fischer, Lange, in his *History of Materialism*, did full justice for the first time to the different phases of materialistic philosophy, and is especially happy in the skill with which he traces the growth of a recognition of law in the phenomena of nature. Since Lessing, æsthetics have always formed a prominent branch of philosophy among the Germans; and they have hardly been less successful as historians of art than as historians of metaphysics. High distinction has been achieved, among other art historians, by Kugler, Vischer, Carrière, and Lübke. Of historians of literature, especially German literature, there is almost a small army. One of the earliest of these was Gervinus, who, although his critical canons are not now in favor, had an unusual faculty for grouping his materials and sharply defining what seemed to him the essential qualities of particular writers and movements. The history of German literature by Vilmar, although written in an eloquent style, is too partial in its judgments to have permanent value. Koberstein is remarkable rather for industry than for insight; but the literary histories of Julian Schmidt and Gottschall are both marked by decisive, often penetrating, critical judgment. One of the best works of this kind for style, thought, and research is Hettner's elaborate *History of Literature in the Eighteenth Century*.

Biographers.

The Germans possess a vast mass of biographical literature, a large proportion of which is rendered almost worthless by inartistic treatment. Luther alone forms the subject of more than one hundred and fifty biographies; yet a satisfactory study of the Reformer has still to be written. In recent times, however, there has been a marked improvement, several biographers having conscientiously striven not only to be thorough in research but to write simply, clearly, and vividly. The first to set a good example was Varnhagen von Ense, whose numerous biographies are masterpieces of well ordered and dignified prose. Germany owes an admirable biography of Ulrich von Hutten to Strauss, who also wrote interesting sketches of several prominent modern authors. Other biographies which deserve mention are Karl Grün's philosophical study of Feuerbach, Rosenkranz's scholar-like life of Diderot, and Justi's life of Winckelmann. The popularity of Mr. Lewes's life of Goethe for a long time deterred German writers from touching a subject he had handled with so much talent; but of late there has been a remarkable revival of interest in Goethe, and Hermann Grimm has ventured to present a fresh study of his intellectual and moral character.

Heinrich Heine.

In imaginative literature the greatest writer of the latest period is Heinrich Heine. No German writer since Goethe and Schiller has excited so much interest throughout Europe, and among the Germans themselves his fame is steadily rising. He professed to care little for what men said of his poetry, yet it is mainly as a lyrical poet that his name lives. His *Buch der Lieder* is one of the most fascinating collections of lyrics in European literature. Although a deadly enemy of the Romantic school, he had moods, especially in youth, in which he shared its dreaminess and mysticism; and these qualities he expressed in some of his best songs, but with perfect grace of style and melody. He struck with equally finished art chords of passion and aspiration beyond the range of even the chief Romanticists, for Heine was in every respect a modern man, penetrated by a love of freedom, and by a high enthusiasm for beauty. Except Goethe, no other German poet achieves his effects by such simple means; with the language of a village maiden he gives shape to feelings and ideas of exquisite refinement and subtlety. His satirical poems are sometimes gross and cynical; but none of them are without touches of humor. In his prose, which deals with a wide range of subjects, he is rather French than German in his love of sparkling epigram and biting wit. Almost every theme, however sacred, gives Heine occasion for mockery, but in the midst of cruel laughter he is often restrained by a pathetic memory, which he expresses with unsurpassed delicacy. This combination of pathos, wit, and humor gives him a unique place in the literature of his country.

Platen.

Platen, who belongs rather to the previous period, was one of the many writers whom Heine bitterly attacked, but he was a poet of considerable power. Like Heine himself, he failed in the drama; and even in his successful writings he is not remarkable for wealth of thought or depth of feeling. His odes and sonnets, however, are in language and metre so artistically finished as to rank among the best classical poems of modern times. Börne was another writer whose fame, although the two men were at one time warm friends, suffered from Heine's satire. He was a manly literary critic, and as a political writer dealt at the despotic Governments of Germany blows which they keenly felt.

Young Germany.

A school of writers known as Young Germany was deeply influenced by Heine, and had the good fortune to be singled out for persecution by the confederate diet. Their object was to effect a complete revolution in the political and social institutions of Germany, and at the same time they became the propagandists of ideas intended to undermine the church. The most important member of the school was Karl Gutzkow, who wrote a number of dramas which maintain their hold of the stage. He was also the author of many romances, of which the chief were *Die Ritter vom Geiste* ("The Knights of the Mind") and *Der Zauberer von Rom* ("The Magician of Rome"). These works are of enormous length, and their polemical tendency has already begun to weaken their interest. But the leading characters are genuine creations, and the incidents are interwoven with great artistic skill. Heinrich Laube,[1] another member of the group, is the author of an historical romance, *The German War*, which represents, in a clear, fresh, and vivid style, the condition of Germany during the Thirty Years' War. He has also enriched the stage with several excellent plays. Less important authors associated with these writers were Gustav Kühne, Theodor Mundt, and Ludolf Wienbarg—the latter universally recognized as a keen and vigorous critic.

Novelists.

The novel has acquired the same important place in Germany as in France and England, and it need scarcely be said that the vast majority of works of this class are forgotten almost as soon as they are issued. One of the most distinguished of recent novelists is Gustav Freytag, whose chief work, *Soll und Haben* ("Debit and Credit"), is a study of commercial life intensely realistic in tendency. Lately he has undertaken a series of romances, *Die Ahnen* ("The Forefathers"), intended to represent in a highly poetic form the different epochs of German history. Important historical romances have been written by Levin Schücking, who is remarkable for his power of vividly conceiving character. The Countess Ida Hahn-Hahn[2] is the writer of a number of novels in an artificial style, affecting to represent good society. Her manner has been cleverly satirized by Fanny Lewald, who is one of the best German novelists, keen and true in observation of life, and artistic in method. Paul Heyse's short tales have firmness of outline, and are at the same time full of delicate grace; as a writer of elaborate romance, he has also achieved success. The humor of Hackländer is generally considered to surpass that of any other recent writer; and among the novelists of simple village life Auerbach easily takes the first place. Frederick Spielhagen has penetrated deeply into the spirit of the age, and in *Problematische Naturen* ("Problematic Natures") and other works reveals its tendencies with cultivated imaginative force. The novels of Fritz Reuter, although written in Platt Deutsch, take high rank; they are fresh in style, and combine keen observation of life with a fine appreciation of comic effect.

Dramatic writers.

Contemporary literature has not, as in England, been divorced from the stage; the best imaginative writers find scope for their energies in work for the theatre. Besides Gutzkow and Laube, Gottschall has been a fertile writer both of tragedy and comedy; Freytag also, and Prutz, are original dramatic authors. The dramas of Christian Grabbe, full of eccentricity, but with a certain wild power, originated a movement resembling to some extent that of the "Sturm und Drang" poets. Its chief representative was Hebbel, a writer endowed with imaginative gifts, but who marred every play by affectation and extravagance. Freiherr von Münch-Bellinghausen, known as Friedrich Halm, author of *Der Fechter von Ravenna* ("The Gladiator of Ravenna"), and Mosenthal, author of *Deborah*, achieved distinction by aiming at something higher than mere stage effect. Paul

[1] [He (1806–84) was a Silesian, and for many years theatre director in Vienna and Leipsic.—AM. ED.]

[2] [She (1805–80) was of noble birth, divorced from her cousin (1829), became a Catholic, and died laboring for outcast women.—AM. ED.]

Lindau is the author of some refined comedies, and Adolf Wilbrandt has written both comedies and tragedies which meet the taste of Vienna. Charlotte Birch-Pfeiffer and Roderich Benedix were prolific writers of plays with the sort of merit that belongs to an intimate knowledge of the technical necessities of the stage.

Lyrical and narrative poets.

Many recent writers have attempted lyrical and narrative poetry, some of them with sufficient power to maintain worthily the traditions of German literature. From about 1830 onwards, a group of Austrian poets, more or less political in tendency, commanded the respect of all Germans. The chief was Count von Auersperg, who assumed the name of Anastasius Grün. His first important work was *Walks of a Vienna Poet*, published in 1831, but his fame rests chiefly on two volumes of lyrics issued some years later. He had enthusiastic faith in the future, and expresses his hopes in verses full of color, sometimes brilliant and effective. Another Austrian writer, Nicholas Strehlenau, generally called Lenau, gives powerful utterance in several poems to the sorrows of a deeply melancholy nature. Meissner and Hartmann, Bohemian poets, have a considerable reputation, the latter as a writer of great artistic merit, the former as a poet of vivid imagination and free sympathies. Leopold Schefer was for a long time a popular poet, and the genial optimism of his chief book, the *Laienbrevier*, is interesting because of the contrast it presents to the pessimist tone of more recent writers. Before the revolutionary movements of 1848 a number of writers attempted to force poetry into the service of freedom. Of these one of the best known is Herwegh.[1] He advocated liberty with a vehemence that won for him immense popularity, but the interest of his writings is rather historical than literary. Ferdinand Freiligrath was of a more truly poetic temperament. His poems, although without delicacy, have graphic force, and in his earlier writings he displayed a remarkable talent for reproducing the gorgeous colors of tropical landscape. Other poets who have made verse a means of awakening in the popular mind a passion for political justice are Hoffmann von Fallersleben, who has a considerable command of musical expression, and Franz Dingelstedt, a versatile writer who has done good work as a novelist and dramatist. Gottschall, already named as a dramatist and an historian of literature, began as a political poet, but afterwards gave evidence of disinterested imagination in two narrative poems, *Göttin* and *Zeno*. The lyrics of Emmanuel Geibel, some of which are also political, with a conservative tendency, have found favor with nearly all classes; they reveal a gentle and refined spirit, and are written with something of Uhland's grace. Among the most distinguished contemporary writers is Robert Hamerling, whose poetry is remarkable for the boldness of its conceptions and its almost vehement passion.

Form in German literature.

Since the middle of the 18th century Germany has never been without writers of deep thought and vast research; and in her supreme writers —in Lessing, Goethe, Schiller, and Heine— these qualities have been associated with a feeling for artistic finish which has not been surpassed in England or even in France. But the tendency of German authors beneath the highest rank has been to neglect the laws of expression. Thus there is in Germany an extraordinary quantity of literature which, although the result of great labor, and full of ideas, makes intolerable demands on the patience of readers. The lack of measure and precision has in many cases deprived of nearly all value powers of imagination, reason, and industry, which would have made the literary fortune of a Frenchman. This deficiency of style is in some degree explained by the fact that an undue proportion of German literature has hitherto been addressed, not to the public, but to specialists, who naturally concern themselves more with substance than with form. During the present generation there have been symptoms of a remarkable change. Ever since the Germans began to feel that they are one people, and to strive after political unity, an increasing number of scholars and thinkers have displayed an ambition to extend their influence, while several imaginative writers have consciously appealed to the nation as a whole. The inevitable result has been that they have aimed at more methodical arrangement than their predecessors, and have cultivated greater force, simplicity, and directness of speech. Nothing has fostered this wholesome tendency so much as the growing respect of the nation for the great masters of its language, a respect indicated by the new editions of their writings which appear year after year. The higher class of poets, dramatists, and novelists have also profited by the deepening conviction that the function of art is not to battle with practical evils, but to create a world of ideal beauty in which the mind may find refuge from the perplexities of real life.

GERMERSHEIM, a fortified town in Rhenish Bavaria, the chief town of a circle, is situated at the confluence of the Queich and the Rhine, 8 miles S. W. of Spires. It possesses a Catholic and a Protestant church, a Latin school, and a hospital. The industries include fishing, shipbuilding, brewing, the manufacture of cigars, and the cultivation of vegetables, fruit, flax, and hemp. The number of the garrison in the town is usually about 2500.

Germersheim existed as a Roman stronghold under the name of Vicus Julius. The citadel was rebuilt by the emperor Conrad II., but the town itself was founded in 1276 by the emperor Rudolph I., who granted it the rights of a free imperial city. He died here in 1291. From 1330 to 1622, when it was conquered by Austria, the town formed part of the Palatinate of the Rhine. From 1644 to 1650 it was in the possession of France; but on the conclusion of the peace of Westphalia it was again joined to the Palatinate. In 1674 it was captured and devastated by the French under Turenne, and after the death of the elector Charles in 1685, it was claimed by the French as a dependency of Alsace, on which account followed the Germersheim succession war, which lasted till the peace of Ryswick in 1697. Through the intervention of the pope in 1702, the French, on payment of a large sum, agreed to vacate the town, and in 1715 its fortifications were rebuilt. On the 3d July, 1744, the French were defeated there by the imperial troops, and on the 19th and 22d July, 1793, by the Austrians. In 1835 the beautiful new town was built, and the present extensive fortifications commenced. Population according to the census of 1905, 5,914.

GERONA, a city of Spain, the chief town of the province of Gerona (one of the four into which Catalonia was divided), is situated about 54 miles N. E. of Barcelona on the railway to Perpignan in France, near the junction of the Ter and the Oña. The older part of the town occupies the steep slope of the hill of the Capuchins, and with its old-fashioned buildings presents a picturesque appearance against a background of loftier heights; while the newer portion stretches down into the plain and beyond the river, which adds to the effect of the scene by a bridge of three arches. The old city walls with their bastions still remain, though in a dilapidated state; and the hill is crowned by what were at one time very strong fortifications. At present Gerona is a comparatively insignificant place, although it is the seat of a bishop, has four parish churches, an *instituto*, a seminary, a public library, and a theatre, numbers about 15,000 inhabitants, and carries on the manufacture of paper and cotton and woollen goods. To the ecclesiologist, however, it offers unusual attractions. The cathedral is one of the grandest specimens of Gothic architecture in Spain, the nave being the widest pointed vault in Christendom, as it measures no less than 73 feet from side to side, while Albi, the next in size, is only 58 feet, and Westminster Abbey is only 38. The old cathedral on the same site was used as a mosque by the Moors, and on their expulsion in 1015 it appears to have been very greatly modified, if not entirely rebuilt. During the 14th century new works were again carried out on an extensive scale; but it was not till the beginning of the 15th that the proposal to erect the present magnificent nave was originated by the master of the works, Gullielmo Boffiy. "The keystone of the last division of the vault," says Mr. Street, "seems to have been placed in the time of Bishop Benito, so late as *circa* 1559," and in 1581 the same bishop laid the first stone of the bell tower. "At the east end of the nave three arches open into the choir and its aisles, which with their many subdivisions give an extraordinary impression of size to the vast vault of the nave, and make it look larger than it really is." The general appearance of the exterior is rather ungainly, but there is a fine approach by a flight of 86 steps to the façade, which rises in tiers and terminates in an oval rose-window. Among the interior decorations the most remarkable is the retablo and baldachin of the 14th century; and among the tombs may be mentioned those of Bishop Berenger (*ob.* 1408), Ramon Berenger (Cap de Estopa), and the Countess Ermesinda (*ob.* 1057). The collegiate church of San Feliu (St. Felix) is mainly of the 14th century, but it was considerably modified in the 16th, and its façade dates from the 18th. It is one of the few Spanish churches that can boast of a genuine spire, and it thus forms a striking feature in the general view of the town. Besides the tomb of Alvarez and the sepulchre of the patron saint, it contains an image of St. Narciso, which, according to the local superstition, had the power of producing swarms of poisonous flies, as was sufficiently proved by the destruction of the French investing the city in 1285 and again in 1684. The Benedictine church of San Pedro de los Gallos is an interesting Romanesque building of early date; and in the same vicinity is a small church worthy of notice as a rare Spanish example of a transverse triapsal plan. Population, 16,200.

Gerona is the ancient *Gerunda*, a city of the Ausetani. It boasts that it is the place in which St. Paul and St. James first rested when they came to Spain; and it became the see of a bishop about 247. For a considerable period it was in the hands of the Moors, and their emir, Soleiman, was in alliance with Pepin about 759. It was taken by Charlemagne in 785; but the Moors regained and sacked it in 795, and it was not till 1015 that they were finally expelled. At a later date it gave the title of count to the king of Aragon's eldest son. Into the details of its later vicissitudes it is needless to enter; but its historians tell how it has been besieged no fewer than twenty-five times in all, and that only four of the sieges have resulted in its capture. The investment by the French under Marshal Hocquisicourt in 1653, that of 1684 by the French under Marshal Belfond, and the successful enterprise of Marshal Noailles in 1694, are the three great events of the 17th century. Surrendered by the French at the peace of Ryswick, it was again captured by Marshal Noailles in 1706, after a brilliant defence; and in 1717 it held out against the Austrians. But its noblest resistance was yet to be made. In May, 1809, it was besieged by the French, with 35,000 troops, under Verdier, Augercau, and St. Cyr; forty batteries were erected against it, and a heavy bombardment maintained; but under the leadership of Mariano Alvarez it held out till famine and fever compelled a capitulation on 12th December. The French, it is said, had spent 20,000 bombs and 60,000 cannon balls, and their loss was estimated at 15,000 men.

GERRHA, an ancient city of Arabia Felix, on the west side of what is now the Persian Gulf, described by Strabo as inhabited by Chaldæan exiles from Babylon, who built their houses of salt and repaired them by the application of salt water. Three identifications of the site have been attempted, D'Anville choosing El Katig, Niebuhr preferring Koneit, and Forster suggesting the ruins at the head of the bay behind the islands of Bahrein.

GERS, a department of France, composed of the whole or parts of the five old districts of Gascony, viz., Armagnac, Astarac, Lomagne, Comminges, and Condomois. It is bounded N. by the department of Lot-et-Garonne, E. by Tarn-et-Garonne and Haute-Garonne, S. by Hautes-Pyrénées and Basses-Pyrénées, and W. by Landes. It lies between 43° 17′ and 44° 5′ N. lat., and between 1° 10′ E. and 0° 18′ W. long., being about 72 miles in length from E. to W., and 53 in breadth from N. to S. This department is hilly, particularly in the south, where it is mostly covered with ramifications of the Pyrenees. Some of these in the south rise nearly 1200 feet above the level of the sea, but they rapidly decrease in height towards the north. The principal of them run from N. E., N., and N. W., and are separated by longitudinal valleys of great beauty and fertility, narrow in the south, but opening in the north to a width of 3 or 4 miles. The greater part of the department belongs to the basin of the Garonne, while a small portion in the west is drained by the Adour. The chief affluents of the former are the Save, Gimone, Arratz, Gers, and Baise; and those of the latter, the Arros, Midou, and Douse, the last two uniting and taking the name of Midouse, before joining the Adour. The climate is temperate and salubrious, but very changeable. There is seldom any snow, and there is scarcely any frost. More than half of the department is arable; about one-seventh is occupied by vines, and the rest is meadows, wood, or heath. The soil is not of great fertility, but is tolerably well cultivated, and the grain produced is more than sufficient for home consumption. Wheat, maize, oats, and rye are the principal grain crops. About one-third of the wine produced is used for home consumption, and the remainder is chiefly manufactured into brandy, known by the name of Armagnac. The amount of brandy distilled in the department annually is about 22 million gallons. Horned cattle, sheep, mules, swine, game, and poultry, particularly ducks and geese, are abundant. The minerals and manufactures are unimportant. There are quarries of red and green marble; and gypsum, marl, white clay, and sand for the manufacture of glass are obtained. Gers is divided into the arrondissements of Auch, Lectoure, Mirande, Condom, and Lombez, with 29 cantons and 467 communes. The chief town is Auch. The total area is

2425 square miles, and the population in 1866 was 295,692, and 238,448 in 1901.

GERSON, JOHN (1363–1429), otherwise John Charlier of Gerson, Johannes Gersonus, John de Gersone, J. Jarson, De Jarsone, or Gersen, the famous chancellor of the university of Paris, and the ruling spirit in the œcumenical councils of Pisa and Constance, was born at the village of Gerson, in the bishopric of Rheims and department of Ardennes, on December 14, 1363. We learn a good many details about his family and early upbringing from allusions in some of his devotional tracts. His parents, Arnulph Charlier and Elizabeth de la Chardenière, "a second Monica," belonged to the peasant class, were of eminent piety, and rejoiced to see seven of their twelve children, four daughters and three sons, devoting themselves to a religious life. Young Gerson was sent to Paris to the famous college of Navarre when fourteen years of age. After a five years' course he obtained the degree of licentiate of arts, and then began his theological studies under two very celebrated teachers, Giles Des Champs (Ægidius Campensis) and Peter D'Ailly (Petrus de Alliaco), rector of the college of Navarre, chancellor of the university, and afterwards bishop of Puy, archbishop of Cambray, and cardinal. D'Ailly remained his life-long friend, and in later life the pupil seems to have become the teacher (see pref. to *Liber de Vita Sper. Animæ*). Gerson very soon attracted the notice of the university. He was elected procurator for the French nation in 1383, when barely twenty years of age, and re-elected the year afterwards. In 1384 he took the degree of bachelor of theology. Three years later a still higher honor was bestowed upon him; he was sent along with the chancellor and others to represent the university in a case of appeal taken to the pope. Dr. John Montson had been condemned by the faculty of theology because he had taught that the Virgin Mary, like other ordinary descendants of Adam, was born in original sin; and the Dominicans, who were fierce opponents of the doctrine of the immaculate conception, were expelled the university. Montson appealed to Pope Clement VII. at Avignon, and D'Ailly, Gerson, and the other university delegates, while they personally supported the doctrine of the immaculate conception, were content to rest their case upon the legal rights of the university to test in its own way its theological teachers. Gerson's biographers have compared his journey to Avignon with Luther's visit to Rome. It is certain that from this time onwards he was zealous in his endeavors to spiritualize the universities, to reform the morals of the clergy, and to put an end to the schism which then divided the church. In 1392 Gerson became doctor of theology, and in 1395, when D'Ailly was made bishop of Puy, he was at the early age of thirty-two, elected chancellor of the university of Paris, and made a canon of Notre Dame. This great university was then at the height of its fame, and its chancellor was necessarily a man prominent not only in France but in Europe, sworn to maintain the rights of his university against both king and pope, and entrusted with the conduct and studies of a vast crowd of students attracted from almost every country in Europe. Gerson's writings bear witness to his deep sense of the responsibilities, anxieties, and troubles of his position. He was all his days a man of letters, and an analysis of his writings is his best biography. His work has three periods, in which he was engaged in reforming the university studies, maturing plans for overcoming the schism (a task which after 1404 absorbed all his energies), and in the evening of his life writing books of devotion.

Gerson wished to banish scholastic subtleties from the studies of the university, and at the same time to put some evangelical warmth into them. He was called at this period of his life Dr. Christianissimus; later his devotional works brought him the title Doctor Consolatorius. His plan was to make theology plain and simple by grounding it on the philosophical principles of nominalism. His method was a clear exposition of the principles of theology where clearness was possible, with a due recognition of the place of mystery in the Christian system of doctrine. Like the great nominalist William of Occam, he saved himself from rationalism by laying hold on mysticism—the Christian mysticism of the school of St. Victor. He thought that in this way he would equally guard against the folly of the old scholastic and the seductions of such Averroistic pantheism as was preached by heretics like Amalric of Bena. His plans for the reformation of university studies may be learned from his *Tract. de Examinatione Doctrinarum* (*Opp.* i. 7), *Epistolæ de reform. Theol.* (i. 121), *Epistolæ ad Studentes Collegii Navarræ, quid et qualiter studere debeat novus theologiæ auditor, et contra curiositatem studentium* (i. 106), and *Lectiones duæ contra vanam curiositatem in negotio fidei* (i. 86). The study of the Bible and of the fathers was to supersede the idle questions of the schools, and in his *Tract. contra romantiam de rosa* (iii. 297) he warns young men against the evil consequences of mediæval romance-reading. He was oftentimes weary of the chancellorship—it involved him in strife, and in money difficulties; he grew tired of public life, and longed for learned leisure. To obtain it he accepted the deanery of Bruges from the duke of Burgundy, but after a short sojourn he returned to Paris and to the chancellorship.

Gerson's chief work was what he did to destroy the great schism. Gregory XI. had died in 1378, one year after Gerson went to the college of Navarre, and since his death the church had had two popes. To the mediæval mind, imaginatively apprehending great thoughts in picture-representations, two popes meant two churches and a divided Christ. The spiritual unity of the church, which is founded on the spiritual union of all believers to Christ, was unintelligible to it. Gerson and his contemporaries could not disentangle the invisible from the visible, and if daring spirits like Wickliffe and Huss declared that the elect were the true church, the practical consequences which they drew from this showed that they also were unable to escape from the confusion. The schism had practically been brought about by France. The popes had been under French influence so long that it appeared to France a political necessity to have her own pope, and pious Frenchmen felt themselves somewhat responsible for the sins and scandals of the schism. Hence the melancholy piety of Gerson, D'Ailly, and their companions, and the energy with which they strove to bring the schism to an end. During the lifetime of Clement the university of Paris, led by D'Ailly, Gerson, and Nicholas Clamenges, met in deliberation about the state of Christendom, and resolved that the schism could be ended in three ways,—by cession, if both popes renounced the tiara unconditionally, by arbitration, or by a general council. Clement died. The king of France, urged by the university, sent orders that no new pope should be elected. The cardinals first elected, and then opened the letter. In the new elections, however, both at Rome and Avignon, the influence of Paris was so much felt that each of the new popes swore to "cede" if his rival would do so also.

Meanwhile in 1395 the national Assembly of France and the French clergy adopted the programme of the university—cession or a general council. The movement gathered strength. In 1398 most of the cardinals and most of the crowned heads in Europe had given their adhesion to the plan. During this period Gerson's literary activity was untiring, and the throb of public expectancy, of hope and fear, is revealed in his multitude of pamphlets. At first there were hopes of a settlement by way of cession. These come out in *Protest. super statum ecclesiæ* (ii. 1), *Tract. de modo habendi se tempore schismatis, De Schismate*, etc. But soon the conduct of the popes made Europe impatient, and the desire for a general council grew strong—see *De Concilio generali unius obedientiæ* (ii. 24). The council was resolved upon. It was to meet at Pisa, and Gerson poured forth tract after tract for its guidance. The most important are—*Trilogus in materia Schismatis* (ii. 83), and *De unitate Ecclesiæ* (ii. 113), in which following D'Ailly (see Tschackert's *Peter v. Ailli*, p. 153), Gerson demonstrates that the ideal unity of the church, based upon Christ, destroyed by the popes, can only be restored by a general council, supreme and legitimate, though unsummoned by a pope. The council met, deposed both anti-popes, and elected Alexander V. Gerson was chosen to address the new pope on the duties of his office. He did so in his *Sermo coram Alexandro Papa in die ascensionis in concilio Pisano* (ii. 131). All hopes of reformation, however, were quenched by the conduct of the new pope. He had been a Franciscan, and loved his order above measure. He issued a bull which laid the parish clergy and the universities at the mercy of the mendicants. The great university of Paris rose in revolt, headed by her chancellor, who wrote a fierce pamphlet—*Censura professorum in theologia circa bullam Alexandri V.* (ii. 442). The pope died soon after, and one of the most profligate men of that time, Pope John XXIII. (Balthasar Cossa), was elected his successor. The council of Pisa had not brought peace; it had only added a third pope. D'Ailly despaired of general councils (see his *De difficultate reformationis in concilio universali*), but Gerson struggled on. Another matter too had roused him. The feuds between the houses of Orleans and Burgundy had long distracted France. The duke of Orleans had been foully and treacherously murdered by the followers of the duke of Burgundy, and a theologian, John Petit, had publicly and unambiguously justified the murder. His eight verities, as he called them—his apologies for the murder—had been, mainly through the influence of Gerson, condemned by the university of Paris, and by the

archbishop and grand inquisitor, and his book had been publicly burned before the cathedral of Notre Dame. Gerson wished a council to confirm this sentence. His literary labors were as untiring as ever. He maintained in a series of tracts that a general council could depose a pope; he drew up indictments against the reigning pontiffs, reiterated the charges against John Petit, and exposed the sin of schism—in short, he did all he could to direct the public mind towards the evils in the church and the way to heal them. His efforts were powerfully seconded by the emperor Sigismund, and the result was the council of Constance. This council, unlike its predecessor at Pisa, was summoned by a pope—Pope John XXIII. Sigismund was present, resolutely determined to unite and reform the church, and guided by Cardinals D'Ailly and Zarabella, and above all by Gerson. Gerson indeed practically ruled the council up to the election of a new pope. It was he that dictated the form of submission and cession made by John XXIII., and directed the process against Huss. Many of Gerson's biographers have found it difficult to reconcile his proceedings against Huss with his own opinions upon the supremacy of the pope; but the difficulty has arisen partly from misunderstanding Gerson's position, partly from supposing him to be the author of a famous tract—*De modis uniendi ac reformandi ecclesiam in concilio universali*. All Gerson's high-sounding phrases about the supremacy of a council were meant to apply to some time of emergency. He was essentially a trimmer, and can scarcely be called a reformer. He never wrote the bold tract of Abbot Andrew of Randolph (*cf.* Schwabe, *Johannes Gerson*, pp. 483–491), and he hated Huss with all the hatred the trimmer has of the reformer. The council of Constance, which revealed the eminence of Gerson, became in the end the cause of his downfall. He was the prosecutor in the case of John Petit, and the council, overawed by the duke of Burgundy, would not affirm the censure of the university and archbishop of Paris. Petit's justification of murder was declared to be only a moral and philosophical opinion, not of faith. The utmost length the council would go was to condemn one proposition, and even this censure was annulled by the new pope, Martin V., on a formal pretext. Gerson dared not return to France, where, in the disturbed state of the kingdom, the duke of Burgundy was in power. He lay hid for a time in Germany, and then returned to France, to Lyons, where his brother was prior of the Celestines. It is said that he taught a school of boys and girls in Lyons, and that the only fee he exacted was to make the children promise to repeat the prayer, "Lord, have mercy on thy poor servant Gerson." His later years were spent in writing books of mystical devotion and hymns. He died at Lyons on July 12, 1429. Tradition declares that during his sojourn there he translated or adapted from the Latin a work upon eternal consolation, which afterwards became very famous under the title of *The Imitation of Christ*, and was attributed to Thomas à Kempis. Recent researches, however, have proved beyond a doubt that the famous *Imitatio Christi* was really written by Thomas, and not by John Gerson or the Abbot Gersen.

The literature on Gerson is very abundant. See Dupin, *Gersoniana*, including *Vita Gersoni*, prefixed to the edition of Gerson's works in 5 vols. fol., from which quotations have here been made; Charles Schmidt, *Essai sur Jean Gerson, Chancelier de l'Université de Paris*, Strasburg, 1839; Schwabe, *Johannes Gerson*, Würzburg, 1859. On the relations between Gerson and D'Ailly, see Paul Tschackert, *Peter von Aillie*, Gotha, 1877. On the authorship of the *Imitatio Christi*, see the editions of Dibden, Genæ, and Kettlewell. On Gerson's public life, see also histories of the councils of Pisa and Constance, especially Herm. v. der Hardt, *Con. Constantiensis libri IV.*, 1695–9.

(T. M. L.)

GERSONIDES, or Ben Gerson, Levi, a distinguished Jewish philosopher and commentator, was born at Bagnolo in Languedoc, towards the close of the 13th century, probably in 1288. As in the case of the other Jewish writers on philosophy during the Middle Ages, extremely little is known of his life. His family had been distinguished for piety and exegetical skill, but though he was known in the Jewish community by commentaries on certain books of the Bible, he never seems to have accepted any Rabbinical post. Possibly the freedom of his opinions, which drew on him the suspicion of infidelity, may have put obstacles in the way of his preferment. He is known to have been at Avignon and Orange during his life, and is believed to have died at Perpignan in 1370. Part of his writings consist of commentaries on the portions of Aristotle then known, or rather of commentaries on the commentaries of Averroes. Some of these are printed in the early Latin editions of Aristotle's works. His most important treatise, that by which he has a place in the history of philosophy, is entitled *Milhamoth Adonai* (The Wars of God), and is said to have occupied twelve years in composition. A portion of it, containing an elaborate survey of astronomy as known to the Arabs, was translated into Latin in 1342 at the request of Clement VI. The *Milhamoth* is throughout modelled after the plan of the great work of Jewish philosophy, the *More Nebuchîm* of Moses Maimonides, and may be regarded as an elaborate criticism from the more philosophical point of view (mainly Averroistic) of orthodoxy as presented in that work. The six books pass in review (1) the doctrine of the soul, in which Gersonides defends the theory of impersonal reason as mediating between God and man, and explains the formation of the higher reason (or acquired intellect, as it was called) in humanity,—his view being thoroughly realist and resembling that of Ibn Gebirol (see Avicebron); (2) prophecy; (3) and (4) God's knowledge of facts and providence, in which is advanced the curious theory that God does not know individual facts, and that, while there is general providence for all, special providence only extends to those whose reason has been enlightened; (5) celestial substances, treating of the strange spiritual hierarchy which the Jewish philosophers of the Middle Ages accepted from the Neo-Platonists and the Pseudo-Dionysius, and also giving, along with astronomical details, much of astrological theory; (6) creation and miracles, in respect to which Gerson deviates widely from the orthodox position of Maimonides.

A careful analysis of the *Milhamoth* is given in Rabbi Isidore Weil's *Philosophie Religieuse de Lévi-Ben-Gerson*, Paris, 1868. See also Munk, *Mélanges de Phil. Juive et Arabe;* and Joel, *Religions-philosophie d. L. Ben-Gerson*, 1862. The *Milhamoth* was published in 1560 at Riva di Trento, and has been republished at Leipsic, 1866.

GERSTÄCKER, Friedrich (1816–1872), who enjoyed a most extensive popularity as a novelist and a writer of travels both at home and abroad, was born at Hamburg on 10th May, 1816. Having lost his father at the age of nine, he was placed under the guardianship of an uncle at Brunswick, who sent him to a house of business at Cassel as clerk. He soon got tired, however, of the monotonous commercial routine, and selected the more active life of a farmer, in which capacity he spent the years from 1835 to 1837 in Saxony. But the uneventful agricultural life was unable to repress in him the innate roving instinct which, according to his own statement, had received a strong impulse in his eighth year by the perusal of *Robinson Crusoe*. The word "America" had from that time exercised on him an irresistible charm, and so he went in 1837 from Bremen to New York. He travelled on foot over all parts of the United States, working as he went for his bare subsistence, and then settled for some time in Arkansas, where he led the life of a roving sportsman. Only now and then he visited inhabited places to see civilized society, and to earn some means by whatever work he could obtain. Thus he went in 1842 to Point Coupée in Louisiana, where he undertook the management of a hotel. This time, however, he did not return with the acquired means to the backwoods, but repaired to his German home to see his mother and other relatives, after having led an adventurous life for six years and a half. On his return to Germany he found himself, to his great surprise, known as an author, on a limited scale at least. His mother had shown his diary, which he regularly sent home, and which contained descriptions of his adventures in the New World, to the editor of the *Rosen*, who readily published them in his periodical. The travelling sketches having found great favor with the German public, Gerstäcker issued them, in 1844, in a collected form, under the title of *Streif- und Jagdzüge durch die Vereinigten Staaten Nordamerikas*. His next literary labors consisted of translations from the English, during the performance of which it occurred to him that he might himself become an original author, since he was able to delineate original characters, to relate remarkable occurrences, and to describe romantic scenery from his own experience, whilst others were obliged to draw upon their imagination only in producing works of fiction. Accordingly Gerstäcker issued, in 1845, his first novel, *Die Regulatoren in Arkansas*, and henceforth the stream of his productiveness flowed on uninterruptedly. In 1849 he again repaired to America, being this time provided with a grant from the then "German Government," and acting at the same time as correspondent to the *Augsburger Allgem. Zeitung*. After having made very extensive travels both in America, Polynesia, and Australia, he returned in 1852 to Leipsic. In 1860 his innate restlessness drove him to South America, chiefly with a view of inspecting the German colonies there. After having traversed nearly all the principal South American countries

he returned to Germany, but for a short time only, for in 1862 he accompanied the Duke Ernest of Coburg-Gotha to Egypt and Abyssinia. This was his last great journey, after the return from which he lived first near Gotha and then at Brunswick, where he died on May 31, 1872.

Gerstäcker was greatly esteemed and liked as a man, on account of his genial temper and straightforward character, and as an author he enjoyed an almost unprecedented popularity at home and was very favorably known abroad. The charm of his productions consists in the natural freshness of his descriptions, nearly all of which have an exotic background, and in the originality of his characters, the most prominent of which are drawn from real life. He did not possess any high literary power, and probably never touched up what he had once written; his writings lack therefore on the whole that artistic finish which forms one of the principal elements of a good writer. This defect, however, impresses even on his works of fiction the stamp of probability, nay of truthfulness. His writings nowhere betray that intention of producing an effect which so often destroys the illusion of the reader in elaboratcly worked out productions. He generally writes in a homely, ungarnished manner, just as a traveller would relate his adventures amidst a circle of friends. His writings, therefore, nearly always rivet the attention of the reader from beginning to end. The works of Gerstäcker have, besides, the merit that they formed a wholesome counterpoise against the too idealistic tendency of the literature of Germany, against the lax and realistic school of France, and against the morbid sensationalism which prevailed in England. A number of his works have been translated into several modern languages, but mostly into English; their descriptions of exciting adventures on land and sea affording, with their sturdy humor, congenial reading to the English-speaking community in the Old and New World. His best works, from a literary point of view, are, besides the abovementioned *Regulatoren*, his *Fluszpiraten des Mississippi*, his South Sea novel *Tahiti*, his Australian romance *Die beiden Sträflinge*, his *Matrosenleben* and *Blau Wasser*. His collected works have been issued in a cheap and handy edition published at Jena.

GERVAIS, Paul (1816–1879), an eminent palæontologist, was born September 26, 1816, at Paris, where he obtained the diplomas of doctor of science and of medicine, and in 1835, as assistant to De Blainville in the laboratory of comparative anatomy at the Museum of Natural History, commenced palæontological research. In 1841 he obtained the chair of zoology and comparative anatomy at the Faculty of Sciences in Montpellier, of which he was in 1856 appointed dean. In 1848–52 appeared his important work *Zoologie et Paléontologie Françaises*, supplementary to the palæontological publications of G. Cuvier and De Blainville; of this a second and greatly improved edition was issued in 1859. In 1865 he accepted the professorship of zoology at the Sorbonne, vacant through the death of Gratiolet; this post he left in 1868 for the chair of comparative anatomy at the Paris Museum of Natural History, the anatomical collections of which he greatly enriched by his exertions. He was elected a member of the Academy of Sciences at Paris, in the place of Coste, January 26, 1874. Gervais was remarkable for the disinterestedness with which he devoted himself to the cause of science. He died February 10, 1879, in the sixty-third year of his age.

Besides his *Zoologie et Paléontologie Françaises*, Gervais wrote:—The "Zoologie" for Laplace's *Voyage autour du Monde*, 1833, etc. (with F. Eydoux); *Hist. naturelle des insectes aptères*, 1837, etc. (with Walkenaer); *Le jardin des plantes*, 1842, etc. (with P. Bernard); *Atlas de Zoologie*, 1844; *Zoologie de la France*, 1847 (with Aicard and others); *Hist. naturelle des mammifères*, 1853, etc.; part of Thiollière's *Description des poissons fossiles*, 1854, etc.; *Théorie du squelette humain*, 1856; *Zoologie médicale*, 1859 (with Van Beneden); *De la métamorphose des organes et des générations alternantes*, 1860; *Un million de faits*, 1861 (with Aicard, Desportes, and others); *De l'ancienneté de l'homme*, 1865; *Zoologie*, 1866, in the series *Éléments des sciences naturelles; Recherches sur l'ancienneté de l'homme et la période quaternaire*, 19 pl., 1867; *Zool. et paléontologie générales*, 1867; *Éléments de zoologie*, 1868 and 1869; *Ostéographie des Cétacés*, 1869, etc. (with Van Beneden); *Notions élémentaires d'histoire naturelle*, 1869 and 1872 (with Marchand and Raulin). His scientific papers are exceedingly numerous. See E. Blanchard, "Nécrologie," *Revue Scientifique*, Feb. 15, 1879, p. 783; S. Meunier, *La Nature*, March 15, 1879, p. 225.

GERVAISE of Canterbury, born about 1150, was one of the monks of the priory of Christ Church, Canterbury, and witnessed the burning of the cathedral in 1174. His earliest known literary effort was a *Tractatus de Combustione et Reparatione Dorobornensis Ecclesiæ*, being an account of that conflagration and of the subsequent process of rebuilding, written probably about 1184. This was followed about 1194 by *Imaginationes de discordiis inter monachos Cantuarienses et Archiepiscopum Baldewinum*, a detailed relation of clerical disputes which had occurred during the episcopate of Baldwin from 1185 to 1190. Gervaise's *Chronica de tempore regum Angliæ, Stephani, Henrici II., et Ricardi I.*, brings the history down to the death of the last named (1199); but his *Vitæ Dorobornensium Archiepiscoporum* closes with that of Reginald Fitz-Joceline (1191). These works, which are all of them characterized by laboriousness and trustworthiness, are reprinted in Twysden's *Historiæ Anglicanæ Scriptores* (vol. x.). In the library of Corpus Christi College, Cambridge, there is an unpublished MS., also by Gervaise, containing a work entitled *Mappa Mundi*, and also an English chronicle from the fabulous ages to the death of Richard. The year of the death of Gervaise is not recorded, but the fact that he does not appear to have accomplished any part of his promised chronicle of the reign of John may fairly be taken to imply that he did not live long after 1200. See Wright, *Biographia Britannica* (1846).

GERVASE, or Gervaise, of Tilbury (*Gervasius Tilburiensis*), an English Latin writer of the 13th century, was probably born at Tilbury in Essex. He is frequently said to have been a nephew of Henry II. of England; but if this was the case, it is strange that in speaking of Henry to Otto IV. he makes no allusion to this relationship, but simply calls him "my master the illustrious king of the English, Henry II., your uncle, *vestri avunculi*." The truth probably is that the statement owes its origin to some careless copyist or reader either taking *vestri* for *nostri* in this passage, or, as M. Petit Radel suggests, the contraction *vri* for *mei*. Gervase was present at the peace of Venice in 1177, was professor of canon law some years later at Bologna, and afterwards entered the service of William II. of Sicily. Having obtained the favor of Otto IV., who had close intercourse with England, he was by him appointed about 1200, chancellor and marshal of the kingdom of Arles. He subsequently received the provostship of the nunnery at Ebsdorf, and died about 1235. His best known, if not his only important work, is the *Otia Imperialia*, which he composed about 1212 for the entertainment of his imperial patron. The first two books are a sort of geographical and historical compendium, and the third is devoted to all kinds of curious facts and beliefs. The history begins at the beginning with the creation of the world, but it only comes down to the author's own days, as he confesses he had not the gift of prophecy. It is a fairly learned but on the whole very dry digest of the ordinary narratives handed on from chronicler to chronicler, relieved at times with curious disquisitions, or passages from the writer's own experience. It is mainly the third book which justifies Mr. Wright's assertion that Gervase was "one of the most amusing writers of the period," for in it he collects a great many popular myths and legends about such matters as the magnet, asbestos, the sirens of the British sea, the veronica, the horn of St. Simon, and so on.

The *Otia* was printed by Leibnitz in vol. i. of *Scriptores rerum Brunsvicensium*, and corrections from MSS. appeared in vol. ii. A portion of the second book had already been printed by J. J. Maderus as *Gervasii Tilb. de Imperio Romanorum*, Helmstadt, 1673; and Liebricht has since made selections from the non-historical portions, Hanover, 1856. The *Dialogus de Scaccario*, now recognized as the work of Nigel bishop of Ely, was long attributed to Gervase; and he had consequently the credit also of the *Tricolumnus* (now lost) claimed by the author of the dialogue. It is needless to mention the works assigned to him by Bale; but we have his own authority for the statement that he wrote a *Liber Facetiarum*, or book of anecdotes, for Henry II. See Petit Radel in *Hist. Litt. de la France*, vol. xvii.

GERVINUS, Georg Gottfried (1805–1871), one of the most eminent literary and political historians of Germany, was born on May 20, 1805, at Darmstadt. His well-to-do parents, belonging to the middle classes, had him educated at the gymnasium of the town, where he studied with great success. At the age of fourteen they chose for him a commercial career, but Gervinus continued his classi-

cal studies privately, and made himself fully acquainted with the polite literature of Germany and other countries. He also cultivated his literary and musical tastes by frequenting the theatre of the Hessian capital, which was then in an excellent condition. In 1825 he relinquished the uncongenial commercial life, and repaired, after a brief preparation, to the university of Giessen to study philology. The short interruption in his school education helped to develop in him, in an eminent degree, his social qualities, and taught him to employ methodically and usefully every hour of his life. In 1826 he went to Heidelberg, where he attended the lectures of the great historian Schlosser, who became henceforth his guide and his model. From 1828 to 1830 he held a mastership in a private institution at Frankfort-on-the-Main, issuing at the same time, in conjunction with Morstadt and Hertlein, a comprehensive edition of Thucydides, and writing an essay on Bloomfield's English translation of the Greek historian. In 1830 he returned to Heidelberg, and wrote among other essays one on Probert's *Ancient Laws of Cambria*. The year 1832 he spent in Italy as travelling tutor to a young Englishman, and on his return to Heidelberg he wrote several historical treatises, which he issued in 1833, in a collected form, as the first volume of his *Historische Schriften*. This publication procured him the appointment of professor extraordinarius; and the first volume of his *Geschichte der poetischen Nationalliteratur der Deutschen* brought him, through the special recommendation of the historian Dahlmann, the appointment to a regular professorship of history and literature at Göttingen. He settled there at Easter, 1836, and married a wealthy young lady, who proved a true "companion to his intellect." In the following year he wrote his *Grundzüge der Historik*, which is perhaps the most thoughtful of his philosophico-historical productions. The same year brought his expulsion from Göttingen in consequence of his manly protest, in conjunction with six of his colleagues, against the unscrupulous violation of the constitution by Ernest Augustus, king of Hanover and duke of Cumberland. After applying himself to his literary and artistic studies at Heidelberg, Darmstadt, and Rome, he returned once more to Heidelberg, where he continued, among other works, his history of German literature, and was appointed in 1844 honorary professor. He zealously took up in the following year the cause of the German Catholics, hoping it would lead to a union of all the Christian confessions, and to the establishment of a national church. He also came forward in 1846 as a patriotic champion of the Schleswig-Holsteiners, and when, in 1847, King Frederick William IV. promulgated the royal decree for summoning the so-called "United Diet" (Vereinigte Landtag), Gervinus hoped that this event would form the basis of the constitutional development of the largest German state; and, thinking that the hour of publicistic activity had arrived, he founded, in common with some other patriotic scholars, the *Deutsche Zeitung*, which certainly was one of the best-written political journals ever published in Germany. His appearance in the political arena secured his election as deputy for the Prussian province of Saxony to the National Assembly sitting in 1848 at Frankfort. The weight of his name and his journalistic activity were of considerable advantage to the liberals in that short-lived parliament; but when he saw that all their endeavors were frustrated by the indecision of the king of Prussia, who declined accepting the imperial crown of Germany, he retired in gloomy disappointment from all active political life. So embittered was he against the royal house of Hohenzollern that neither the formation of the North German Confederation in 1866, which in former years he would have hailed with the greatest satisfaction, nor the glorious establishment in 1870 of a united German empire, could reconcile him to a dynasty one sickly scion of which had foiled the national aspirations of Germany. Gervinus now took refuge among his literary and historical studies, more especially devoting himself to the study of Shakespeare, the result of which was his great work *Shakespeare* (1849, 1850), in four volumes. He also revised his *magnum opus*, the *History of German Literature*, for a fourth edition (1853), and began at the same time to plan his *History of the 19th Century*, which was to be a continuation of the *History of the 18th Century* by his guide and teacher, Schlosser. He heralded that voluminous work by a programme or manifesto entitled *Einleitung in die Geschichte des neunzehnten Jahrhunderts*, which was issued in 1853, and made a great stir in the literary and political world, chiefly owing to the circumstance that the Government of Baden imprudently instituted a prosecution against the author for high treason. Gervinus had prophesied in his famous pamphlet the final victory of democracy, and based his prediction on the theory that all the great revolutionary outbreaks follow each other in a kind of geometrical progression,—to wit, 1820, 1830, and 1848. Hence he concluded that the next great revolutionary shock would take place about 1888–1890, and that it would insure the final victory to democracy, just as the same decade brought in former centuries freedom and independence to the Americans, the French, the English, and the inhabitants of the Netherlands. Arraigned before a tribunal, he defended himself with a great display of ability and manly courage, but was nevertheless condemned to an imprisonment of two months, and all the copies of the "seditious publication" were to be destroyed. Fortunately for Germany, this disgrace was spared her, the verdict having been rescinded by a higher tribunal. This occurrence, which would have aroused a more elastic temper to greater political activity, had the contrary effect upon the sensitive mind of Gervinus He buried himself still more among his books, and even forbore to deliver lectures. With unwearied energy he now devoted himself to his above-mentioned great historical work, *Geschichte des neunzehnten Jahrhunderts seit den Wiener Verträgen*, which he issued in eight volumes, the first in 1855 and the last in 1866. In the midst of his historical studies he found relief in his devotion to the works of his favorite musician Handel. He founded, and liberally supported, the Handel Society in Germany, whose object it was to restore the compositions of the great master in an authentic form, and to issue German versions of the texts suitable to the compositions. The result of his Handel studies was his critical and æsthetical work *Händel und Shakespeare, zur Æsthetik der Tonkunst* (1868), in which he drew an ingenious parallel between his favorite poet and his favorite composer, showing that their intellectual affinity was based on the Teutonic origin common to both, on the same healthiness of their mental capacities, on their analogous intellectual development, and even on a similarity of their inclinations and fates. This philosophical treatise fell flat on the German public, who could not forgive the author for having extolled Handel above the great national masters, Haydn, Mozart, and Beethoven. The ill-success of that publication, and the indifference with which the latter volumes of his *History of the 19th Century* were received by his countrymen, together with the feeling of disappointment that the unity of Germany had been brought about in another fashion and by other means than he wished to see employed, combined to embitter in the highest degree the writer and the politician, but it could not sour in him his kindly and humane disposition, nor did it in the least affect his sociable temper, and he cultivated refined society to the last. He died rather suddenly, on the 18th of March, 1871.

The works which will, above all others, insure to Gervinus a lasting fame, are his *Geschichte der Deutschen Dichtung* and his work on *Shakespeare*. The former, a fifth edition of which was edited (1871–74) by the eminent literary historian and philologist, Professor Karl Bartsch of Heidelberg, was the first comprehensive history of German poetry in a connected form, and was executed with a literary skill, a profound erudition, and a lofty enthusiasm for the subject, which imprinted upon it the stamp of a national work of permanent value. The author represented the literary activity of Germany in its successive stages as it grew out of her political life, thus making political history the foil and basis of literary history. His judgment was sincere and independent, and although his criticism often assumed a censorious and pedantic tone against the most prominent poets of Germany, the German people, without allowing themselves to be misguided in their judgment regarding the merits of Goethe, Schiller, Jean Paul, etc., gratefully accepted his work as a national homage to that subject of which they have most reason to be proud. The object of Gervinus in writing his literary history was, besides, a patriotic one. He endeavored to show that Germany, having already attained great eminence in literature, should henceforth exclusively devote herself to political activity, and surpass other nations also in this respect. He had a no less patriotic object in view in writing his commentary on *Shakespeare*, which has been made popular in England by an excellent translation. This work is not so much a philological or æsthetical commentary as a treatise pointing out the ethical or moral precepts which may be deduced from his productions, and this circumstance makes it of considerable value and interest also to English readers. Gervinus, who considered Shakespeare the intellectual property of Germany, in the same way as he considered Handel the artistic

property of England, wished above all to inculcate on his countrymen the teachings of healthy practical activity to be found in the works of the English dramatist. The object for which he wrote, viz., the moral improvement of his readers from a practical point of view, seemed to him the easier to be accomplished through the productions of Shakespeare, because the poet was descended from a kindred race, and the fructifying seeds of his thoughts and sentiments, falling upon a congenial soil, would be sure to take root there kindly. As a political historian, Gervinus was the antipode of Ranke. Following the principles of F. C. Schlosser, he slighted all documentary history. He had such a deep distrust of all state papers and diplomatic documents that he considered them as most untrustworthy sources for any historical record. He confined himself, therefore, chiefly to taking into account the political events and their results just as they lay on the surface; and, not consulting the state archives for the secret springs which set them in motion, he based his historical narratives almost entirely on his subjective judgment. Many brilliant passages will be found in his general *History of the 19th Century*, such as the accounts of the South American and Greek revolutions, and of the July revolution in 1830; and his *Historische Schriften* also contain a number of valuable treatises and essays, which may be said to have paved the way to a new era in the art of writing history. Gervinus entertained a kindly feeling towards England, which he called the land of political mastery; and though he was, what is both the bane and the glory of so many Germans, rather a cosmopolitan, he nevertheless remained a German patriot to the core. He was, besides, distinguished by a rare nobleness and manliness of character, and considering that he was a powerful factor in the literary and political progress of modern times, we may fully agree with Ranke's opinion "that he will never be forgotten." (C. A. B.)

GESENIUS, Friedrich Heinrich Wilhelm (1786–1842), Orientalist and biblical critic, was born at Nordhausen, Hanover, on the 3d of February, 1786. From the gymnasium of his native town he passed in 1803 as a student of philosophy and theology to the university of Helmstadt, where Henke was his most influential teacher; but the latter part of his undergraduate course was taken at Göttingen, where Eichhorn and T. C. Tychsen were then at the height of their popularity. In 1806, shortly after graduation, he became "repetent" and "privat-docent" in that university; and, as he was fond of afterwards relating, had Neander for his first pupil in Hebrew. In 1809, on the recommendation of Johann von Müller, he was appointed to a mastership in the gymnasium of Heiligenstadt, Westphalia, whence, in the following year, he was transferred to the university of Halle, where, from being professor extraordinarius in theology, he was in a very short time promoted to an ordinary chair (1811). Many offers were subsequently made to him of high preferment elsewhere, but he clung to Halle for the remainder of his life, and taught with great regularity for upwards of thirty years, the only interruptions indeed being that of 1813–14, occasioned by the war of liberation, during which the university was closed, and those occasioned by two prolonged literary tours, first in 1820 to France and England in the society of his colleague Thilo for the examination of rare Oriental manuscripts, and afterwards in 1835 to England and Holland in connection with his Phœnician studies. At a very early period he became the most popular teacher of Hebrew and of Old Testament introduction and exegesis in Germany; and during his later years the annual number of students attending his lectures on these and kindred subjects, such as church history and Biblical archæology, amounted to nearly 500. Of his pupils many have risen to great eminence in the departments he specially cultivated; among these the names of Von Bohlen, Hoffmann, Hupfeld, Rödiger, Tuch, Vatke, and Benfey may be mentioned. In 1827 Gesenius was made a consistorialrath; but, unless account be taken of the violent attacks to which he, along with his friend and colleague Wegscheider, was in 1830 subjected by Hengstenberg and his party in the *Evangelische Kirchenzeitung*, there are few noteworthy occurrences to be recorded in his biography. His death took place at Halle, October 23, 1842. It would be difficult to overestimate the services rendered by Gesenius to Semitic philology. To him belongs in a large measure the credit of having freed it from the trammels of theological and religious prepossession by which it had previously been hampered, and of inaugurating the strictly scientific method which has since been so fruitful in valuable results. Nor can it be doubted that as an exegete he has exercised a powerful, and on the whole a beneficial, influence on the tendencies of modern theological investigation.

Of his very numerous works the earliest, published in 1810, entitled *Versuch über die Maltesische Sprache*, was a successful refutation of the widely current opinion that the modern Maltese was of Punic origin. In the same year appeared the first volume of the *Hebräisches u. Chaldäisches Handwörterbuch*, completed in 1812 (8th ed., 1878; English translation by Tregelles, 1846–52). The *Hebräische Grammatik*, published in 1813 (22d ed., by Kautzsch, 1878), was followed in 1815 by the *Geschichte der Hebräischen Sprache* (now very rare), and in 1817 by the *Ausführliches Lehrgebäude der Hebräischen Sprache*. The first volume of his well-known commentary on Isaiah (*Der Prophet Jesaja*), with a translation, appeared in 1821; but the work was not completed until 1829. The *Thesaurus philologico-criticus Linguæ Hebraicæ et Chaldaicæ V. T.*, begun in 1829, he did not live to complete; the latter part of the third volume is edited by Rödiger (1858). The other works of Gesenius are *De Pentateuchi Samaritani Origine, Indole, et Auctoritate* (1815), supplemented in 1822 and 1824 by the treatise *De Samaritanorum theologia*, and by an edition of *Carmina Samaritana; Paläographische Studien über Phönizische u. Punische Schrift* (1835), a pioneering work which he followed up in 1837 by his collection of Phœnician monuments (*Scripturæ linguæque Phœniciæ monumenta quotquot supersunt*); an Aramaic lexicon (1834–39); and a treatise on the Himyaritic language written in conjunction with Rödiger in 1841. Gesenius also contributed extensively to Ersch and Gruber's *Encyclopädie*, and enriched the German translation of Burckhardt's *Travels in Syria and the Holy Land* with valuable geographical notes. For many years he also edited the Halle *Allgemeine Literaturzeitung*. A well executed sketch of his life was published in 1843 (*Gesenius: eine Erinnerung für seine Freunde*).

GESNER, Johann Matthias (1691–1761), a distinguished German classical scholar, was born at Roth, near Ansbach, 9th April, 1691. He studied at the university of Jena, and in 1714 published a work on the *Philopatris* ascribed to Lucian. In 1715 he became librarian and conrector at Weimar, in 1729 rector of the gymnasium at Ansbach, and in 1730 rector of the Thomas school at Leipsic, where he had for colleagues Joh. A. Ernesti and Joh. Sebastian Bach. On the foundation of the university of Göttingen he became professor of rhetoric and subsequently librarian also. He died at Göttingen 3d August, 1761. His special merit as a classicist is the attention he devoted to the explanation and illustration of the subject matter of the classical authors.

His principal works are editions of the *Scriptores de re rustica*, of Quintilian, Claudian, Pliny the younger, Horace, and the Orphic poems; *Primæ lineæ isagoges in eruditionem universam*; an edition of Faber's *Thesaurus eruditionis scholasticæ*, afterwards continued under the title *Novus linguæ et eruditionis Romanæ thesaurus*; *Opuscula varii argumenti*; and *Thesaurus epistolarum Gesneri*. See Ernesti, *Opuscula oratoria*, 1762; and *Göttinger Professoren*, Gotha, 1872.

GESNER, or Gessner, Konrad (1516–1565), a very famous naturalist and author, surnamed the German Pliny and literarum miraculum on account of his vast erudition, was born of poor parents at Zürich, 26th March, 1516. He received the first elements of education from Chaplain Frick, his maternal uncle; and it was while gathering plants in his relative's garden that he became imbued with that enthusiastic love of science which remained with him through life. In 1513 he went to Strasburg, then to Bourges, and in 1534 to Paris, studying at all those places with characteristic passionate zeal. In 1535 we find him again at Zürich, where he married somewhat imprudently, for he was very poor, and had no immediate prospect of bettering his condition. His whole day was occupied in teaching, but at least the night was his own, and too great a portion of the time that others give to rest was occupied by Gesner in adding to his already great stock of erudition. In 1537 he was appointed professor of Greek at Lausanne, and in 1541 professor of physics and natural history at Zürich. But in neither of these offices was he well paid, and during those years he wrote a large number of books, partly to support himself, partly from the interest he felt in their subjects. He wrote several works on ancient medicine and on botany, and a treatise on milk (in which he described the rural economy of Switzerland), translated into Latin a Greek logical manual and some works on the moral interpretation of Homer, carefully edited a new edition of *Johannis Stobæi Sententiæ* (Zürich, 1543) and an expurgated edition of Martial (1544), prepared a new edition of the Latin dictionary of Ambrosius Calepinus (Basel, 1544), and wrote besides some lesser dissertations and translations. All this, however, was only mere side work, for in 1545 he issued at Zürich the first

part of his justly renowned *Bibliotheca Universalis*, a catalogue of all the works in Latin, Greek, and Hebrew, extant and not extant, published or as yet unpublished. Under each important name there was given a vast mass of bibliographical information and criticism, original and selected. Three years later the second part of this stupendous work appeared, likewise at Zürich, under the title of *Pandectarum sive partitionum universalium Conradi Gesneri Tigurini Libri XXI.* Only nineteen of these books then appeared; the twenty-first, which was a theological encyclopædia, was published in 1549, but the twentieth, which was to contain the medical writings, and which he intended should represent the quintessence of the labors of a lifetime, was never finished and never published.

The next few years were spent in writing small treatises, and in the preparation of another *magnum opus*, a zoological work entitled *Historia Animalium*, which was published in six books (the last of these unfinished) at Zürich between 1551 and 1587. To prepare himself for the worthy execution of this undertaking he read 250 authors, travelled over nearly all Europe, received hints from hosts of learned friends, and did not disdain the information which he obtained from hunters and shepherds. He also made himself a proficient artist, in order that he might by drawings assist his labors. This work contained the names of all known animals in the ancient and modern languages, a description of each as to every important particular, and a mass of interesting literary information, embracing facts and legends regarding them. After this he again occupied himself with lesser writings for some years. He devoted some attention to philology, aided in the preparation of a German-Latin dictionary, and pointed out the force and undreamt-of beauty that lay in that then vulgar and half-developed tongue. But again these and other publications were only secondary labors, for he had a third great work in preparation. He had for some time given great attention to botany, and he now proposed to publish a work on that science corresponding to his great work on zoology. He had made a large collection of materials towards this when his health, never very good, completely gave way. A few hours before his death he desired to be carried into his museum, and there he spent the last moments of life. He died 13th December, 1565, not having completed his fiftieth year.

Gesner's intense devotion to science, and his almost incredible powers of acquisition, are seen from the recital of the facts of his biography, and from a mere catalogue of his labors. It deserves to be added that his life was singularly pure and blameless, that his love of knowledge was as disinterested as it was engrossing, that he was always ready and glad to acknowledge any help he received. When obliged to engage in controversy, he did so in a dignified and courteous manner. His medical writings show him to have been far above the silly prejudices of his day. A cheerful and amiable piety was a prominent feature in his character—a character chastened, not soured, by the trials of a hard lifetime.

After Gesner's death his unpublished writings went through a career of vicissitudes not unlike that of their author. A part of them, edited by Professor Schmiedel, was published at Nuremberg in 1753. Other parts followed, but the work was never completed. Lives of Gesner have been written by J. Simmler (Zürich, 1566) and J. Hanhart (Winterthur, 1824). See also Lebert's *Gesner als Arzt* (Zürich, 1854), and Gesner's autobiography in his *Bibliotheca Universalis* (1st ed., p. 180).

GESSNER, Salomon (1730–1788), Swiss painter and poet, and once a very favorite and widely-read author, was born at Zürich 1st April, 1730. With the exception of some time spent in Berlin, and a visit to Hamburg undertaken in order to see Hagedorn, he passed the whole of his life in his native town, where he carried on the business of a bookseller. He died 2d March, 1788. The first of his writings that attracted attention was his *Lied eines Schweizers an sein bewaffnetes Mädchen* (1751). Then followed *Daphnis* (1754), *Idyllen* (1756), *Inkel and Yariko* (1756), a version of a story already worked out by Gellert and Bodmer, and *Der Tod Abels* (1758), "a sort of idyllic prose pastoral." It is somewhat difficult for us now to understand the reason of Gessner's universal popularity, unless it was the taste of the period for the conventional pastoral. His writings are marked, it is true, by sweetness and melody, but the sweetness soon becomes insipidity, and the melody monotony. He represents in most of his works the existence of shepherds in a golden or rather tinsel age, and nothing more unreal could possibly be imagined. His men and women are inane and lifeless representations. They are all alike, and all equally uninteresting. They never give utterance to any powerful, genuine, human sentiments. Their talk is but meaningless platitude. As a painter Gessner represented "still country scenes, rocks, springs and waterfalls, shepherds and shepherdesses"—in short, the conventional classical landscape. His son, Konrad Gessner (1764–1826), was also a painter of some reputation.

Collected editions of Gessner's works were repeatedly published (2 vols. 1777–78, finally 2 vols. 1841, both at Zürich). They were translated into French (3 vols., Paris, 1786–93), and versions of the *Idyllen* appeared in English, Dutch, Portuguese, Spanish, Swedish, and Bohemian. Gessner's life was written by Hottinger (Zürich, 1796); see also his *Briefwechsel mit seinem Sohn* (Bern and Zürich, 1801).

GESTA ROMANORUM, a Latin collection of anecdotes and tales, probably compiled about the end of the 13th century or the beginning of the 14th, which still possesses a twofold literary interest, first as one of the most popular books of its time, and secondly as the source, directly or indirectly, of much which has since become current under the stamp of genius. Of its authorship nothing certain is known; and there is little but gratuitous conjecture to associate it either with the name of Helinandus or with that of Petrus Berchorius (Pierre Bercheure). It is even a matter of debate whether it took its rise in England, Germany, or France; while Mr. Douce was disposed to give the credit of it to the Germans, Herr Œsterley is inclined to recognize the priority of the English. The work at least was evidently intended as a manual for preachers, and was probably written by one who himself belonged to the clerical profession. The name, *Deeds of the Romans*, is only partially appropriate to the collection in its present form, since, besides the titles from Greek and Latin history and legend, it comprises fragments of very various origin, Oriental and European. The unifying element of the book is its moral purpose; everything is made serviceable for reproof and doctrine, the powerful chemistry of the allegorical method extracting the sunshine of Christian truth from the cucumbers of the most worldly and wicked circumstance. The style is barbarous, and the narrative ability of the compiler seems to vary with his source; but he has managed to bring together a considerable variety of excellent material. He gives us, for example, the germ of the romance of "Guy of Warwick," the story of "Darius and his Three Sons," versified by Occleve, part of Chaucer's "Man of Lawes' Tale," a tale of the emperor Theodosius, the same in its main features as that of *Lear*, the story of the "Three Black Crows," the "Hermit and the Angel," so well known from Parnell's version, and a story identical with the *Fridolin* of Schiller. Owing to the loose structure of the book, it was easy for a transcriber to insert any additional story into his own copy, and consequently the MSS. of the *Gesta Romanorum* exhibit considerable variety. Œsterley, who has bestowed the fullest investigation on the subject, recognizes an English group of MSS. (written always in Latin), a German group (sometimes in Latin and sometimes in German), and a group which is represented by the vulgate or common printed text. The earliest editions are supposed to be those of Ketelaer and De Lecompt at Utrecht, of Arnold Ter Hoenen at Cologne, and of Ulrich Zell at Cologne; but the exact date is in all three cases uncertain.

An English translation, probably based directly on the MS. Harl. 5369, was published by Wynkyn de Worde about 1510–1515, the only copy of which now known to exist is preserved in the library of St. John's College, Cambridge. In 1577 Richard Robinson published a revised edition of Wynkyn de Worde, and the book proved highly popular. Between 1648 and 1703 at least eight impressions were issued. In 1703 appeared the first vol. of a translation by B. P., probably Bartholomew Pratt, "from the Latin edition of 1514." A translation by the Rev. C. Swan, first published in 2 vols. in 1824, forms part of Bohn's Antiquarian Library, and was re-edited by Wynnard Hooper in 1877. The German translation was first printed at Augshurg, 1489. A French version, under the title of *Le Violier des histoires romaines moraliséz*, appeared in the early part of the 16th century, and went through a number of editions; it has been reprinted by G. Brunet (Paris, 1858). Critical editions of the Latin text have been produced by A. Keller (Stuttgart, 1842), and Œsterley (Berlin, 1872). GETA, Publius Septimus Antoninus (189–212), younger son of the Roman emperor Severus, was born at Milan, 189 A.D. Between him and his brother Caracalla there existed from their early years a keen rivalry and antipathy. On the death of their father in 211 they were, in accordance with his instructions, proclaimed joint emperors: and after the failure of a proposed treaty by which Caracalla was to retain Europe and western Africa, and Geta Asia and Egypt, Caracalla, on the pretence of a desire for reconciliation, arranged a meeting with his brother in his mother's apartments, and by means of assassins murdered him in her presence (212). His name was obliterated from all public inscriptions; all coins bearing his effigy were to be destroyed; and the use of his name, either in conversation or in writing, was forbidden under pain of death.

GETHSEMANE. See Jerusalem.

GEULINCX, Arnold (1625–1669), one of the most distinguished of the earlier Cartesians, was born at Antwerp in 1625. Few details are known with regard to his life, and his more important works are extremely rare. He studied philosophy and medicine at the university of Louvain, and took there the degree of doctor. For twelve years he continued at the same university as lecturer, and was noted as one of the most successful teachers. For what reason he left is quite uncertain, but he seems to have been obliged to fly from Louvain and to take refuge in Leyden, where he appears to have been in the utmost distress. Only the generous assistance of a friend, by name Heidanus, prevented his death from absolute want of means. At Leyden he entered the Protestant Church, having been previously a Catholic, and it has been supposed that his flight from Louvain was due to doubts excited there as to his orthodoxy. This, however, is merely conjecture. In 1663, through his friend Heidanus, he obtained leave to lecture at Leyden, and devoted himself with the utmost zeal to his new duties. He died in 1669. His most important works were published posthumously. During his lifetime there seem to have been made public only the theses which he defended on graduating at Louvain (*Saturnalia, seu quæstiones quodlibiticæ in utramque partem disputatæ*, 2d ed. 1665). The *Metaphysica vera*, 1691, and the *Γνῶθισεαυτόν, sive Ethica, post tristia auctoris fata*, 1696 (first part, 1665), are the works by which he is known in the history of philosophy. In addition to these were published *Physica vera*, *Logica restituta*, and *Annotata in Principia Philosophiæ R. Cartesii*. Geulincx takes up principally the doctrine, left in an obscure and unsatisfactory state by Descartes, of the relation between soul and body. Extension and thought, the essences of spiritual and corporeal natures, are absolutely distinct, and cannot act upon one another. External facts are not the causes of mental states, nor are mental states the causes of physical facts. So far as the physical universe is concerned, we are merely spectators. The influence we seem by will to exercise over bodies is only apparent; volition and action only accompany one another. I cannot be the author of any state of which I am unconscious, for my very nature is consciousness; but I am not conscious of the mechanism by which bodily motion is produced, hence I am not the author of bodily motion. Body and mind are like two clocks which act together, because at each instant they are adjusted by God. A physical occurrence is but the occasion on which God excites in me a corresponding mental state. Geulincx is thus definitely the originator of the theory called Occasionalism. But the principles on which that theory was founded compelled a further advance. God, who is the cause of the concomitance of bodily and mental facts, is in truth the sole cause in the universe. No fact contains in itself the ground of any other; the existence of the facts is due to God, their sequence and co-existence are also due to him. He is the ground of all that is. My desires or volitions and my thoughts are thus the desires, volitions, or thoughts of God. Apart from God, the finite being has no reality. Geulincx is thus the precursor of Spinoza, and, like Spinoza, he gave out his final results under the title of Ethics. Descartes had left untouched, or nearly so, the difficult problem of the relation between the universal element or thought and the particular desires or inclinations. All these are regarded by Geulincx as modes of the divine thought and action, and accordingly the end of human endeavor is the end of divine will, or the realization of reason. The love of right reason is the supreme virtue, whence flow the cardinal virtues diligence, obedience, justice, and humility. Liberty is obedience to reason; *nemo servit qui rationi servit.*

Geulincx has not directly touched the problem which evidently must have caused the greatest difficulty to the Cartesians—how we perceive extended reality—though he plainly indicates the opinion that we do not perceive it, but have the idea of it from God. He thus carried out to their extreme consequences the irreconcilable elements in the Cartesian metaphysics, and his works have the peculiar value attaching to the vigorous development of a one-sided principle. The abrupt contradictions to which such development leads of necessity compels revision of the principle itself.

Phil.*, xi. pp. 97–169 (Ritter's account of Geulincx is the fullest in any history of philosophy); K. Fischer, *Gesch. d. neu. Phil.*, i. 2, 11–27.

GEX, a town of France, the chief town of an arrondissement in the department of Ain, is beautifully situated, 2000 feet above sea level, at the base of the Jura chain on the Journant, 3 miles from the Swiss frontier, and 10 miles N. W. of Geneva. It has tanneries, saw-mills, and corn-mills, and a considerable trade in cheese and wine. The town gives its name to the old *Pays de Gex*, situated between the Alps and the Jura, which was successively under the protection of the Swiss, the Genevese, and the counts of Savoy, until in 1602 it came into the possession of France, retaining, however, until the Revolution, its old independent jurisdiction, with Gex as its chief town. The population of the town in 1901 was 1,443.

GEYSERS, Geisers, or Geisirs, are fountains of a peculiar construction, in virtue of which they shoot up into the air, at more or less regular intervals of time, a column of heated water and steam or of mud. Those of Iceland have been known at least from the time of Saxo Grammaticus, who briefly mentions them in his *Danorum regum historiæ;* but no satisfactory explanation of the phenomena was advanced till near the middle of the present century, when Bunsen brought his scientific knowledge and power of investigation to bear on the subject. Sir George Mackenzie, in his *Travels in Iceland*, 1811, had written as follows:—"Let us suppose a cavity C (fig. 1), communicating with the pipe PQ, filled with boiling water to the height AB, and that the steam above this line is confined so that it sustains the water to the height P. If we suppose a sudden addition of heat to be applied under the cavity C, a quantity of steam will be produced which, owing to the great pressure, will be evolved in starts causing the noises like discharges of artillery, and the shaking of the ground." He admitted that even to his own mind this could be only a partial explanation of the facts of the case, and that he was unable to account for the frequent and periodical production of the necessary heat; but he has the credit of hitting on what is certainly the proximate cause—the sudden evolution of steam. By Bunsen's theory the whole difficulty is solved, as is beautifully demonstrated by the artificial geyser designed by Professor J. H. J. Müller of Freiburg (fig. 2). If the tube *ab* be filled with water and heated at two points, first at *a* and then at *b*, the following succession of changes is produced. The water at *a* beginning to boil, the superincumbent column is consequently raised, and the stratum of water which was on the point of boiling at *b* being raised to *d* is there subjected to a diminished pressure; a sudden evolution of steam accordingly takes place at *d*, and the superincumbent water is violently ejected. Received in the basin *c*, the air-cooled water sinks back into the tube, and the temperature of the whole column is consequently lowered; but the under strata of water are naturally those which are least affected by the cooling process; the boiling

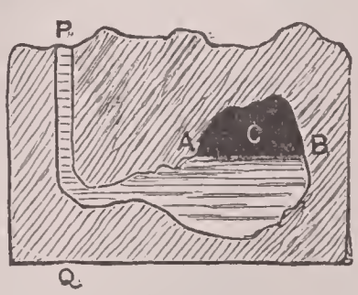

Fig. 1.

begins again at A, and the same succession of events is the result (see R. Bunsen, "Physikalische Beobachtungen über die hauptsächlichsten Gisire Islands," in *Poggendorf's Annalen der Physik und Chemie*, vol. lxxii., 1847; and J. Müller, "Ueber Bunsen's Geysertheorie," *ibid*, vol. lxxix., 1850). The principal difference between the artificial and the natural geyser-tube is that in the latter the effect is not necessarily produced by two distinct sources of heat like the two fires of the experimental apparatus, but by the continual influx of heat from the bottom of the shaft, and the differences between the boiling points of the different parts of the column owing to the different pressures of the superincumbent mass. This may be thus illustrated:—AB is the column of water; on the right side the figures represent approximately the boiling points (Fahr.) calculated according to the ordinary laws, and the figures on the left the actual temperature of the same places. Both gradually increase as we descend, but the relation between the two is very different at different heights. At the top the water is still 39° from its boiling point, and even at the bottom it is 19°; but at D the deficiency is only 4°. If, then, the stratum at D be suddenly lifted as high as C, it will be 2° above the boiling point there, and will consequently expend those 2° in the formation of steam.

Any hot spring capable of depositing siliceous material by the evaporation of its water may in course of time transform itself into a geyser, a tube being gradually built up as the level of the basin is raised. And every geyser continuing to deposit siliceous material is preparing its own destruction; for as soon as the tube becomes deep enough to contain a column of water sufficiently heavy to prevent the lower strata attaining their boiling points, the whole mechanism is deranged. In geyser districts it is easy to find thermal springs busy with the construction of the tube; warm pools, or *laugs*, as the Icelanders call them, on the top of siliceous mounds, with the mouth of the shaft still open in the middle; and dry basins from which the water has receded with their shafts now choked with rubbish.

Geysers exist at the present time in many volcanic regions, as in the Eastern Archipelago, Japan and South America; but the three localities where they attain their highest development are Iceland, New Zealand, and Wyoming in the United States. The very name by which we call them indicates the historical priority of the Iceland group. It is an old Icelandic word—*geysir*, equivalent to gusher or rager—from the verb *geysa*, itself a derivative of *gjosa*, to gush. In native usage it is the proper name of the Great Geyser, and not an appellative—the general term *hver*, a hot spring, making the nearest approach to the European sense of the word (see Cleasby and Vigfusson, *Icelandic English Dictionary*, s. v.).

The Iceland geysers are situated about 50 miles N. W. of Hecla, in a broad valley of alluvial formation, at the foot of a range of hills from 300 to 400 feet in height. Within a circuit of about two miles, upwards of one hundred hot springs may be counted, varying greatly both in character and dimensions. The Great Geyser in its calm periods appears as a circular pool 72 feet in diameter and 4 feet in depth, occupying a basin on the summit of a mound of siliceous concretion; and in the centre of the basin is a shaft, about 9 feet in diameter and 70 feet in depth, lined with the same siliceous material. The clear sea-green water flows over the eastern rim of the basin in little runnels. On the surface it has a temperature of from 76° to 89° Cent., or from 168° to 188° Fahr. Within the shaft there is of course a continual shifting both of the average temperature of the column and of the relative temperatures of the several strata. The results of the observations of Bunsen and Descloizeaux in 1874 were as follows (*cf. Poggendorff's Annalen*, loc. cit., and *Comptes Rendus*, vol. xxiii.):—About three hours after a great eruption on July 6th, the temperature 6 metres from the bottom of the shaft was 121·6° C.; at 9·50 metres, 121·1°; at 16·30 metres, 109° (?); and at 19·70 metres, 95° (?). About nine hours after a great eruption on July 6th, at about 0·3 metres from the bottom, it was 123°; at 4·8 metres it was 122·7°; at 9·6 metres, 113°; at 14·4 metres, 85·8°; at 19·2 metres, 82·6°. On the 7th, there having been no eruption since the previous forenoon, the temperature at the bottom was 127·5°; at 5 metres from the bottom, 123; at 9 metres, 120·4°; at 14·75 metres, 106·4°; and at 19 metres, 55°. About three hours after a small eruption, which took place at forty minutes past three o'clock in the afternoon of the 7th, the temperature at the bottom was 126·5°; at 6·85 metres up it was 121·8°; at 14·75 metres, 110°; and at 19 metres, 55°. Thus, continues Bunsen, it is evident that the temperature of the column diminishes from the bottom upwards; that, leaving out of view small irregularities, the temperature in all parts of the column is found to be steadily on the increase in proportion to the time that has elapsed since the previous eruption; that even a few minutes before the great eruption the temperature at no point of the water column reached the boiling point corresponding to the atmospheric pressure at that part; and finally, that the temperature about half-way up the shaft made the nearest approach to the appropriate boiling point, and that this approach was closer in proportion as an eruption was at hand. Observations made by Mr. Robert Walker in August, 1874, remarkably confirm those of Professor Bunsen (see *Proceedings of Roy. Soc. of Edinburgh*, vol. viii. p. 514). The Great Geyser has varied very much in the nature and frequency of its eruptions since it began to be observed. In 1809 and 1810, *e. g.*, according to Hooker and Mackenzie, its columns were 100 or 90 feet high, and rose at intervals of 30 hours, while, according to Henderson, in 1815, the intervals were of 6 hours, and the altitude from 80 to 150 feet.

About 100 paces from the Great Geyser is the *Strokkr* or churn, which was first described by Stanlay in 1789. The shaft in this case is about 44 feet deep, and, instead of being cylindrical, is funnel-shaped, having a width of about 8 feet at the mouth, but contracting to about 10 inches near the centre. By casting stones or turf into the shaft so as to stopper the narrow neck, eruptions can be accelerated, and they often exceed in magnitude those of the Great Geyser itself.[1] During quiescence the column of water fills only the lower part of the shaft, its surface usually lying from 9 to 12 feet below the level of the soil. Unlike that of the Great Geyser, it is always in ebullition, and its temperature is subject to comparatively slight differences On the 8th of July, 1847, Bunsen found the temperature at the bottom 112·9° C.; at 3 metres from the bottom, 111·4°; and at 6 metres, 108°; the whole depth of water was on that occasion 10·15 metres. On the 6th, at 2·90 metres from the bottom, it was 114·2°; and at 6·20 metres, 109·3°. On the 10th, at 0·35 metres from the bottom, the reading gave 113·9°; at 4·65 metres, 113·7°; and at 8·85 metres, 99·9°.

The great geyser-district of New Zealand is situated in the south of the province of Auckland, in or near the upper basin of the Waikato river to the N. E. of Lake Taupo. In many respects the scene presented in various parts of the districts is far more striking and beautiful than anything of the same kind to be found in Iceland, but this is due not so much to the grandeur of the geysers proper as to the bewildering profusion of boiling springs, steam-jets, and mud-volcanoes, and to the fantastic effects produced on the rocks by the siliceous deposits and by the action of the boiling water. At Whakarewarewa, near Lake Loto Rua, there is a group of eight geysers, one of which, the Waikato, throws

[1] According to Professor Tyndall (see *Royal Institution Notices*, 1853, and *Heat as a Mode of Motion*, 1863), this effect of the stopper is simply due to the fact that it is an impediment to the normally gradual ascent of the heated aqueous strata, and that it is an impediment which at last is suddenly removed.

the column to a height of 30 or 35 feet (see Hoehstetter, *New Zealand*, 1867). But it is in the Yellowstone Park, in the north-west corner of Wyoming, that the various phenomena of the geysers can be observed on the most portentous scale. The geysers themselves are to be counted by hundreds, and the dimensions and activity of several of them render those of Iceland and New Zealand almost insignificant in comparison. The principal groups are situated along the course of that tributary of the Upper Madison, which bears the name of Fire Hole River. Many of the individual geysers have very distinctive characteristics in the form and color of the mound, in the style of the eruption, and in the shape of the column. The "Giantess," as observed by Langford (1870) and Dunraven (1874), lifts the main column to a height of only 50 or 60 feet, but shoots a thin spire to no less than 250 feet. The "Castle" varies in height from 10 or 15 to 250 feet; and on the occasions of greatest effort the noise is appalling, and shakes the ground like an earthquake. Strong distinct pulsations, says Lord Dunraven, occurred at a maximum rate of seventy per minute, having a general tendency to increase gradually in vigor and rapidity until the greatest development of strength was attained, and then sinking again by degrees. The jets grew stronger and stronger at every pulsation for ten or twelve strokes, until the effort would culminate in three impulses of unusual power. The total display lasted about an hour. "Old Faithful" owes its name to the regularity of its action. Its eruptions, which raise the water to a height of 100 or 150 feet, last for about five minutes, and recur every three-quarters of an hour. The "Beehive" sometimes attains a height of 219 feet; and the water, instead of falling back into the basin, is dissipated in spray and vapor. Very various accounts are given of the "Giant." Hayden saw it playing for an hour and twenty minutes, and reaching a height of 140 feet, and Lieutenant Doane says it continued in action for three hours and a half, and had a maximum of 200 feet; but at the earl of Dunraven's visit the eruption lasted only a few minutes. For further details see Dunraven's *Great Divide* (1874), and the *Reports* of Professor Hayden.

GEZER (גֶּזֶר), a royal Canaanite city on the boundary of Ephraim in the maritime plain (Josh. xvi. 3–10). It was allotted to the Levites, but its original inhabitants were not driven out until the time of Solomon, when the Egyptians took the city, which was given to Solomon's wife (1 Kings ix. 16). Under the form Gazera it is mentioned as being in the neighborhood of Emmaus-Nicopolis ('Amwâs) and Jamnia (Yebnah) (1 Macc. iv. 15). Throughout the history of the Maccabean wars Gazera plays the part of an important frontier post. It was first taken from the Greeks by Simon the Asmonean (1 Macc. xiv. 7). Josephus also mentions that the city was "naturally strong" (*Antiq.*, viii. 6, 1). The position of Gezer is defined by Jerome (*Onomasticon*, s. v.) as 4 Roman miles north (contra septentrionem) of Nicopolis ('Amwâs) This points to the ruined site called *Tell Jezer*, near the village of Abu Shûsheh, about 4 miles northwest of 'Amwâs. The site is naturally very strong, the town standing on an isolated hill, commanding the western road to Jerusalem, just where it begins to enter the mountains of Judah. The name Gezer (from a root signifying "insulated") was no doubt derived from the position of the place. The ruins include rock-cut tombs, wine-presses, caves, and quarries, with foundations of a citadel on the hill top. A very fine spring ('Ain Yerdeh) exists on the east, and in 1874 a curious discovery was made on the hill side near the spring. The words Tahum Gezer, "boundary of Gezer," were found cut in Hebrew letters on the live rock in two places, and in each case the Greek name Alkios occurred with them. The genuineness of this curious inscription has not been disputed.

GFRÖRER, August Friedrich (1803–1861), historian, was born at Calw, Würtemberg, on the 5th of March, 1803, and at the close of his preliminary studies at the seminary of Blaubeuren, entered the university of Tübingen in 1821 as a student of evangelical theology. After passing his final examinations in 1825, he spent a year in Switzerland, during part of which time he acted as companion and secretary to Bonstetten; the year 1827 was spent chiefly in Rome. Returning to Würtemberg in 1828, he first undertook the duties of repetent or theological tutor in Tübingen, and afterwards accepted a curacy in Stuttgart; but having in 1830 received an appointment in the royal public library at Stuttgart, he thenceforth gave himself exclusively to literature and historical science. His first work on Philo (*Philo u. die jüdisch-alexandrinische Theosophie*, 1831) was rapidly followed by an elaborate biography, in two volumes, of Gustavus Adolphus (*Gustav Adolf, König von Schweden*, 1835–1837), and by a critical history of primitive Christianity (*Kritische Geschichte des Urchristenthums*, 1838), in three volumes, consisting of three parts, entitled respectively "The Century of Salvation," (*Jahrhundert des Heils*), "Sacred Legend," (*Die heilige Sage*), and "Truth" (*Die Wahrheit*). In both of the last-named works Gfrörer had manifested opinions unfavorable to Protestantism, which, however, were not openly avowed until fully developed in his church history (*Allgemeine Kirchengeschichte bis Beginn des 14ten Jahrhunderts*, 1841–1846). In the autumn of 1846 he was appointed to the chair of history in the university of Freiburg, where he continued to teach until his death, which took place at Carlsbad on the 10th of July, 1861. In 1848 he sat as a representative in the Frankfort parliament, where he supported the "High German" party, and in 1853 he publicly went over to the Church of Rome, influenced, however, in this, it is said, more by regard for what he conceived to be its political value, than by any purely religious consideration. Among his later works the most important is the *Geschichte der ost- u. westfränkischen Karolinger* (1858); but those on the pseudo-Isidorian Decretals (*Untersuchung über Alter, Ursprung, u. Werth der Decretalen des falschen Isidorus*, 1848), on the primitive history of mankind (*Urgeschichte des menschlichen Geschlechts*, 1855), on Hildebrand (*Papst Gregor VII. u. sein Zeitalter*, 1859–61), on the history of the 18th century (*Geschichte des 18ten Jahrhunderts*, 1862–73), on German popular rights (*Zur Geschichte deutscher Volksrechte*, 1866), and on Byzantine history (*Byzantinische Geschichte*, 1872–74), are also works of real value. The fruit of much original research, they convey a great quantity of fresh information, and are unusually rich in suggestion; their chief fault may be said to lie in an excess of ingenuity, which leads their author to imagine combinations which never existed, and to invent the most recondite causes for historical occurrences, the explanation of which is rather to be sought in the region of the obvious.

GHÂTS, or Ghauts (literally "the Landing Stairs" from the sea, or "Passes"), two ranges of mountains extending along the eastern and western shores of the Indian peninsula. The *Eastern Ghâts* run in fragmentary spurs and ranges down the Madras coast. They commence in the Orissa district of Balasor, pass southwards through Cuttack and Purí, enter the Madras presidency in Ganjám, and sweep southwards through the districts of Vizagapatam, Godávari, Nellore, Chengalpat, South Arcot, Trichinopoli, and Tinnevelly. They run at a distance of from 50 to 150 miles from the coast, except in Ganjám and Vizagapatam, where in places they almost abut on the Bay of Bengal. Their geological formation is granite, with gneiss and mica slate, with clay slate, hornblende, and primitive limestone overlying. The average elevation is about 1500 feet, but several hills in Ganjám are between 4000 and 5000 feet. The *Western Ghâts* start from the north of the Tápti valley, and run south through Khándesh, Násik, Tanna, Satara, Ratnagiri, Kanara, and Malabar, and the states of Cochin and Travancore, meeting the Eastern Ghâts at an angle near Cape Comorin. The range of the Western Ghâts extends uninterruptedly, with the exception of a gap or valley 20 miles across known as the Palghât gap. The length of the range is 800 miles from the Tápti to the Palghât gap, and south of this about 200 miles to the extreme south of the peninsula. In many parts there is only a narrow low strip of coast between the hills and the shore; at one point they rise in magnificent precipices and headlands out of the ocean. The average elevation is 3000 feet, precipitous on the western side facing the sea, but with a more gradual slope on the east to the plains below. The highest peaks in the northern section are Mahábaleswar, where is the summer capital of the Government of Bombay, 4700 feet; Purandhar, 4472; and Sinhgarh, 4162 feet. South of Mahábaleswar the elevation diminishes to about 1000 feet above sea-level. Further south the elevation again increases, and attains its maximum towards Coorg, where the highest peaks vary from 5500 to 7000 feet, and where the main range joins the interior Nilgiri hills. South of the Palghât gap, the peaks of the Western Ghâts rise as high as 7000 feet. The geological formation is trap in the northern and laterite in southern section.

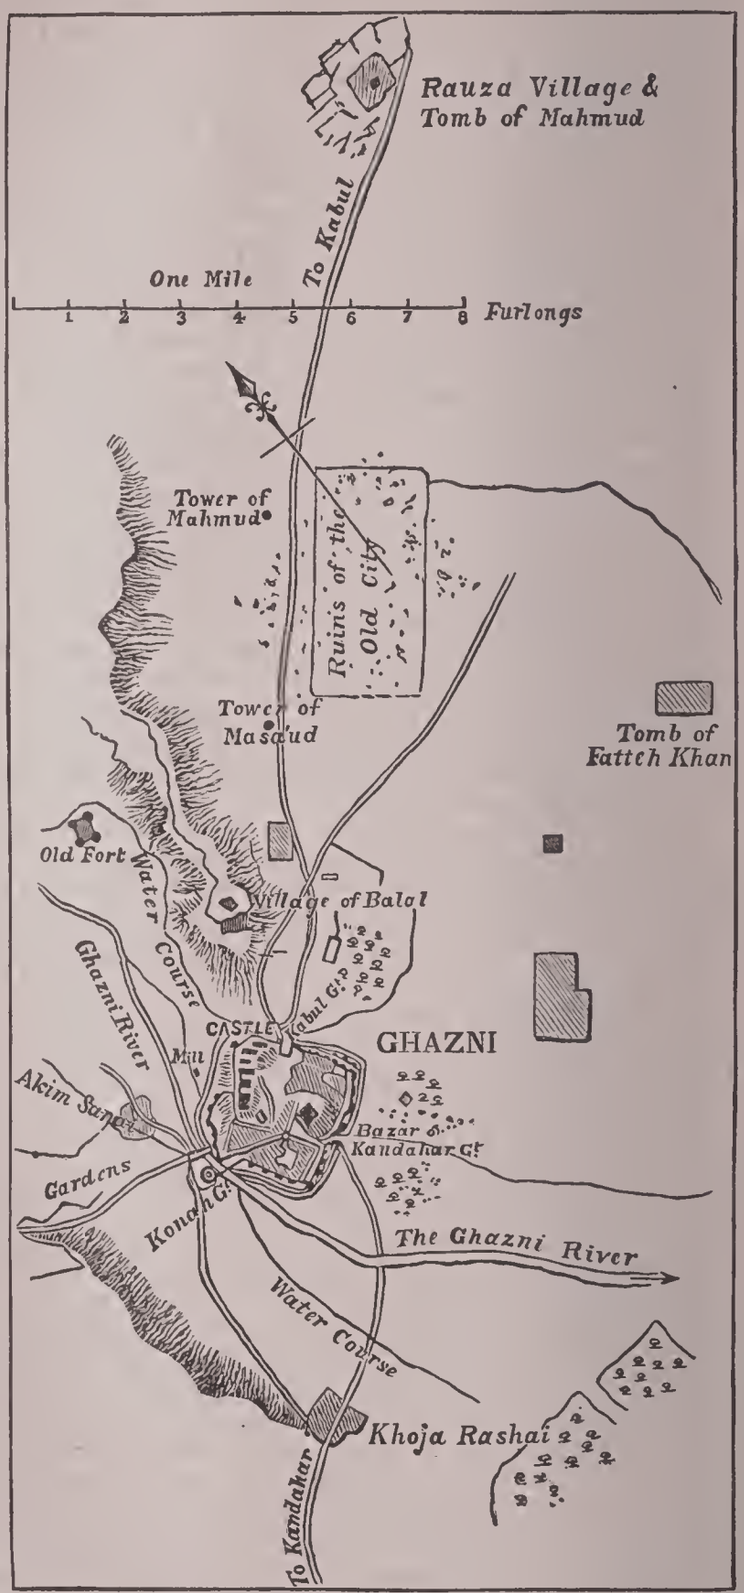
GHÁZIÁBÁD, a town in Meerut district, North-Western Provinces of India, distant 12 miles from Delhi and 28 miles from Meerut, in 28° 39′ 55″ N. lat., 77° 28′ 10″ E. long. The town was founded in 1740 by Ghází-ud-dín, brother of Nawab Salábat Jang, ruler of the Deccan, and takes its name from its founder. It has considerably risen in importance of late years, from having been selected as the point of junction of the East Indian, and the Sind, Punjab, and Delhi railways. A branch into Delhi city diverges from Ghániábád. Population (1872) 7365.

GHÁZIPUR, a district of British India, in the lieutenant-governorship of the North-Western Provinces, and included in the Benares division. It is bounded on the N. by Azimgarh and Sáran, E. by Sáran, S. by Sháhábád, and W. by Benares and Jaunpur. Gházípur forms part of the great alluvial plain of the Ganges, which divides it into two unequal portions. The northern subdivision lies between the Gumti and the Gográ, whose confluences with the main stream mark its eastern and western limits respectively. The southern tract is a much smaller strip of country, enclosed between the Karamnása and the great river itself. No hill or natural eminence is to be found in the district. A few lakes are scattered here and there, formed where the rivers have deserted their ancient channels. The largest is that of Suráha, once a northern bend of the Ganges, but now an almost isolated sheet of water, 5 miles long by about 4 broad.

Gházípur is a closely cultivated district, and out of a total area of 2168 square miles 1546 are actually under cultivation. The harvests are the same as those common to the whole of the plain districts of the North-Western Provinces. The census of 1872 returned a total population in Gházípur district of 1,345,570 souls (males 696,572, females 648,829), dwelling in 3725 villages or townships, and inhabiting 285,007 houses. The Hindus numbered 1,221,810, or 90·7 per cent., and Mahometans, 123,455. Of the three higher Hindu castes there were — Bráhmans, 123,012; Rájputs, 295,355; and Baniyás, 49,538. The lower castes are represented by the Ahírs, 171,216; Chámárs, 122,075; Káyasths, 22,480; and Kurmís, 18,136. Amongst the Mussulmans, the Shaikhs numbered 26,940; Sayyids, 4525; Mughals, 570; and Patháns, 18,452. The district is rich, and in the eastern parts the soil is extremely fertile, so that the cultivators are, on the whole, in easy circumstances. Sixteen towns contain a population exceeding 5000, viz., Gházípur, 38,853; Mahatwar Khás, 8975; Shiupur Diar, 9279; Gahmar, 9050; Sherpur, 7958; Riotipur, 9323; Bára, 5424; Chit, 5821; Narhi, 5527; Bansdih, 7319; Rioti, 7700; Maniar, 5285; Ballia, 8521; Bairia, 5589; Sonbarsa, 7162; and Rasra, 7261. The chief imports into the district are English piece goods and thread, cotton, salt, spices, and grain; the principal exports, country cloth, sugar, fuller's earth, oil seeds, and hides. The headquarters of the Government opium manufacture is at Gházípur town. Carbonate of soda is manufactured from the *reh* or saline efflorescence of the barren *usar* plains, and largely exported. Saltpetre is also largely prepared from the same source. The great trade route is the Ganges, but good roads connect all the principal centres with each other. The East Indian Railway runs for 24 miles through the district, with stations at Zamániah, Dildarnagar, and Gahmar. The total amount of imperial, local, and municipal revenue of the district in 1876 was £200,000. Gházípur is said to be one of the hottest and dampest districts in the North-Western Provinces. In 1869 the annual mean temperature was 80° Fahr., the lowest monthly mean being 61° Fahr., in January, and the highest, 98°, in May. The average total rainfall for eleven years from 1860 to 1871 was 40·1 inches, the maximum being 50·5 inches, in 1861, and the minimum 21·5 inches, in 1868.

GHÁZIPUR TOWN, the capital of the district, stands on the low alluvial northern bank of the Ganges, in 35° 23′ 36″ N. lat. and 83° 35′ 13″ E. long., covering an area of 416 acres, and with a population in 1900 of 45,000. There is considerable trade in sugar, tobacco, long cloth, and rose water. It is the headquarters of the Government opium department, where all the opium from the North-Western Provinces is collected and manufactured under a monopoly. A metalled road runs from Gházípur to Zamániah station on the East Indian Railway, 13½ miles. Lord Cornwallis, the governor-general of India, died at Gházípur in 1805, and a monument and marble statue are erected over his grave.

GHAZNI (called in European books often Ghaznah, Gazna, Ghizni, or Ghuznee, in the Oriental histories more generally Ghaznín), a famous city in Afghanistan, the seat of an extensive empire under two different mediæval dynasties, and again of prominent interest in the modern history of British India. Ghazni stands on the high tableland of central Afghanistan, in 68° 20′ E. long., 33° 34′ N. lat., at a height of 7726 feet above the sea, and on the direct road between Kandahar and Cabul, 233 miles by road N. E. from the first, and 85 miles S. W. from the second. It also stands at the head of the Gomal route from the Indus, one much followed by trade.



Sketch of Ghazni and its Environs.

Ghazni, as it now exists, is a place in decay, and probably does not contain more than 10,000 inhabitants. It stands at the base of the terminal spur of a ridge of hills, an offshoot from the Gul-Koh, which forms the watershed between the Arghandáb and Tarnak rivers (see AFGHANISTAN). The

castle stands at the northern angle of the town next the hills, and is about 150 feet above the plain. The town walls stand on an elevation, partly artificial, and form an irregular square, close on a mile in circuit (including the castle), the walls being partly of stone or brick laid in mud, and partly of clay built in courses. They are flanked by numerous towers. There is also a loopholed fausse-braye wall, and a ditch which can be filled (partially at least) from the Ghazni river, which flows close to the west of the town. There are three gates. The town consists of dirty and very irregular streets of houses several stories high, but with two straighter streets of more pretension, crossing near the middle of the town. New fortifications had been erected previous to 1857, but their present state is not known. In 1839 they were of no real power to resist artillery of moderate calibre, though imposing in aspect and highly picturesque, judging from the views given by Sir Keith Jackson and others. Of the strategical importance of Ghazni there can hardly be a question. The view to the south is extensive, and the plain in the direction of Kandahar stretches to the horizon. It is bare except in the vicinity of the river, where villages and gardens are tolerably numerous. Abundant crops of wheat and barley are grown, as well as of madder, besides minor products. The climate is notoriously cold,—snow lying two or three feet deep for about three months, and tradition speaks of the city as having been more than once overwhelmed by snow-drift. Fuel is scarce, consisting chiefly of prickly shrubs. In summer the heat is not like that of Kandahar or Cabul, but the radiation from the bare heights renders the nights oppressive, and constant dust-storms occur. It is evident that the present restricted walls cannot have contained the vaunted city of Mahmúd. Probably the existing site formed the citadel only of his city. The remarks of Ibn Batuta (*c.* 1332) already suggest the present state of things, viz., a small town occupied, a large space of ruin; for a considerable area to the N. E. is covered with ruins, or rather with a vast extent of shapeless mounds, which are pointed out as Old Ghazni. The only remains retaining architectural character are two remarkable towers, rising to the height of about 140 feet, and some 400 yards apart from each other. They are similar, but whether identical, in design, is not clearly recorded. They belong, on a smaller and far less elaborate scale, to the same class as the Kutb Minar at Delhi. Views of one of the minarets will be found in Fergusson's *Indian Architecture*, in Vigne's *Visit to Ghazni, Cabul, etc.*, in Atkinson's *Sketches in Afghanistan*, and other works. Arabic inscriptions in Cufic characters show the most northerly to have been the work of Mahmúd himself, the other that of his son Masa'úd. On the Cabul road, a mile beyond the Minaret of Mahmúd, is a village called Rauzah ("the Garden," a term often applied to garden-mausoleums). Here, in a poor garden, stands the tomb of the famous conqueror himself. It is a prism of white marble standing on a plinth of the same, and bearing a Cufic inscription praying the mercy of God on the most noble Amír, the great king, the Lord of church and state, Abul Kásim Mahmúd, son of Sabuktigín. The tomb stands in a rude chamber, covered with a dome of clay, and hung with old shawls, ostrich eggs, tiger-skins, and so forth. The village stands among luxuriant gardens and orchards, watered by a copious aqueduct. Sultan Baber celebrates the excellence of the grapes of Rauzah.

The famous "Gates of Somnath" (so-styled) were attached to the building covering Mahmúd's tomb until their removal to India, under Lord Ellenborough's orders, on the evacuation of the country in 1842. The governor-general's intention, as announced in a famous prose pæan addressed to the Hindu princes, was to have carried them solemnly through Upper and Central India to Guzerat, and there to have restored them to the (long-desecrated) temple. Calmer reflection prevailed, and the gates were consigned to the arsenal at Agra, where they now remain. These gates (11 feet in height, 9½ in width) are ascertained to be of Himalayan cedar (deodar), and are richly carved in geometric Saracenic patterns, so that there is no likelihood of any real connection with Somnath. But tradition did ascribe to them such a connection. And when Sháh Shúja in 1831 treated with Mahárája Ranjit Singh for aid to recover the throne of Cabul, one of Ranjit's stipulations was the restoration of the gates to Somnath, a circumstance which probably suggested the notion to the eccentric governor-general. A still more remarkable fact (stated in a report by Capt. Claude Wade, dated 21st Nov., 1831) is that the sháh reminded the mahárája of a prophecy that foreboded the downfall of the Sikh dominion on the removal of the Ghazni gates. The gates were removed to India in the end of 1842; and the Sikh kingdom practically collapsed with the death of Sher Singh in September, 1843. Another relic of Sultan Mahmúd is the *Band-i-Sultán*, a great dam on the Ghazni river, some 12 miles above the city. Baber describes it as 80 or 100 feet in height, probably along the slope, and about 600 feet long. It had lain ruined in his time since its destruction by Alá-uddin Jahánsoz, but Baber sent money to restore it. Vigne calls it only 25 feet in height. He found it much out of repair. It supplies irrigation to the plain west of Ghazni.

There are many holy shrines about Ghazni surrounded by orchards and vineyards. Baber speaks of them, and tells how he detected and put a stop to the imposture of a pretended miracle at one of them. These sanctuaries make Ghazni a place of Moslem pilgrimage, and it is said that at Constantinople much respect is paid to those who have worshipped at the tomb of the great Ghází. To test the genuineness of the boast, professed pilgrims are called on to describe the chief *notabilia* of the place, and are expected to name all those detailed in certain current Persian verses.

The city is not mentioned by any narrator of Alexander's expedition, nor by any ancient author so as to admit of positive recognition. But it is very possibly the *Gazaca* which Ptolemy places among the *Paropamisadæ*, and this may not be inconsistent with Sir H. Rawlinson's identification of it with *Gazos*, an Indian city spoken of by two obscure Greek poets as an impregnable place of war. The name is probably connected with the Persian and Sanskrit *ganj* and *ganja*, a treasury (whence the Greek and Latin *Gaza*). We seem to have positive evidence of the existence of the city before the Mahometan times (644) in the travels of the Chinese pilgrim, Hwen Thsang, who speaks of *Ho-si-na* (*i. e.*, probably *Ghazna*), as one of the capitals of *Tsaukuta* or Arachosia, a place of great strength. In early Mahometan times the country adjoining Ghazni was called *Zábul*. When the Mahometans first invaded that region Ghazni was a wealthy entrepôt of the Indian trade. Of the extent of this trade some idea is given by Ibn Haukal, who states that at Cabul, then a mart of the same trade, there was sold yearly indigo to the value of two million dínárs (£1,000,000). The enterprise of Islám underwent several ebbs and flows over this region. The provinces on the Helmand and about Ghazni were invaded as early as the caliphate of Moáwia (662–680). The arms of Ya'kúb Leis swept over Cabul and Arachosia (Al-Rukhaj) about 871, and the people of the latter country were forcibly converted. Though the Hindu dynasty of Cabul held a part of the valley of Cabul river till the time of Mahmúd, it is probably to the period just mentioned that we must refer the permanent Mahometan occupation of Ghazni. Indeed, the building of the fort and city is ascribed by a Mahometan historian to 'Amrú Leis, the brother and successor of Ya'kúb (d. 901), though the facts already stated discredit this. In the latter part of the 9th century the family of the Samání, sprung from Samarkand, reigned in splendor at Bokhara. Alptigín, originally a Turkish slave, and high in the service of the dynasty, about the middle of the 10th century, losing the favor of the court, wrested Ghazni from its chief (who is styled Abú Bakr Lawík, wáli of Ghazni), and established himself there. His government was recognized from Bokhara, and held till his death. In 977 another Turk slave, Sabuktigín, who had married the daughter of his master Alptigín, obtained rule in Ghazni. He made himself lord of nearly all the present territory of Afghanistan and of the Punjab. In 997 Mahmúd, son of Sabuktigín, succeeded to the government, and with his name Ghazni and the Ghaznevid dynasty have become perpetually associated. Issuing forth year after year from that capital, Mahmúd carried fully seventeen expeditions of devastation through northern India and Guzerat, as well as others to the north and west. From the borders of Kurdistan to Samarkand, from the Caspian to the Ganges, his authority was acknowledged. The wealth brought back to Ghazni was enormous, and contemporary historians give glowing descriptions of the magnificence of the capital, as well as of the conqueror's munificent support of literature. Mahmúd died in 1030, and some fourteen kings of his house came after him; but though there was some revival of importance under Ibrahim (1059–1099), the empire never reached anything like the same splendor and power. It was overshadowed by the Seljuks of Persia, and by the rising rivalry of Ghur (*q. v.*), the hostility of which it had repeatedly provoked. Bahram Sháh (1118–1152) put to death Kutbuddín, one of the princes of Ghúr, called king of the Jibál or Hill country, who had withdrawn to Ghazni. This prince's brother, Saifuddín Súri, came to take vengeance, and drove out Bahram. But the latter recapturing the place (1149) paraded Saifuddín and his vizier ignominiously about the city, and then

hanged them on the bridge. Alá-uddín of Ghúr, younger brother of the two slain princes, then gathered a great host, and came against Bahram, who met him on the Helmand. The Ghúri prince, after repeated victories, stormed Ghazni, and gave it over to fire and sword. The dead kings of the house of Mahmúd, except the conqueror himself and two others, were torn from their graves and hurnt, whilst the bodies of the princes of Ghúr were solemnly disinterred and carried to the distant tombs of their ancestors. It seems certain that Ghazni never recovered the splendor that perished then (1152). Alá-uddín, who from this deed became known in history as *Jahánsoz* (*Brûlemonde*), returned to Ghúr, and Bahram reoccupied Ghazni; he died in 1157. In the time of his son Khusru Sháh, Ghazni was taken by the Turkish tribes called Ghuzz (generally believed to have been what are now called Turkomans). The king fled to Lahore, and the dynasty ended with his son. In 1173 the Ghuzz were expelled by Ghiyássuddín Sultan of Ghúr (nephew of Alá-uddín Jahánsoz), who made Ghazni over to his hrother Muízuddin. This famous prince, whom the later historians call, it is not clear why, *Shahâb-uddín* Ghúrí, shortly afterwards (1174–5) invaded India, taking Multán and Uchh. This was the first of many successive inroads on western and northern India, in one of which Lahore was wrested from Khusrú Malik, the last of Mahmúd's house, who died a captive in the hills of Ghúr. In 1192 Prithvi Rái or Pithora (as the Moslem writers call him) the Chohán king of Ajmir, heing defeated and slain near Thanesar, the whole country from the Himálaya to Ajmir became subject to the Ghúrí king of Ghazni. On the death of his brother Ghiyássuddín, with whose power he had been constantly associated, and of whose conquests he had been the chief instrument, Muízuddin became sole sovereign over Ghúr and Ghazni, and the latter place was then again for a brief period the seat of an empire nearly as extensive as that of Mahmúd the son of Sabuktigín. Muízuddin crossed the Indus once more to put down a rebellion of the Khokars in tho Punjah, and on his way hack was murdered by a band of them, or, as some say, by one of the *Mulâhidah* or Assassins. The slave lieutenants of Muízuddin carried on the conquest of India, and as the rapidly succeeding events broke their dependence on any master, they estahlished at Delhi that monarchy of which, after it had endured through many dynasties, and had culminated with the Moghul house of Baber, the shadow perished in 1857. The death of Muízuddin was followed hy struggle and anarchy, ending for a time in the annexation of Ghazni to the empire of Khwarazm by Mahommed Sháh, who conferred it on his famous son, Jaláluddin, and Ghazni hecame the headquarters of the latter. After Jenghiz Khan had extinguished the power of his family in Turkestan, Jaláluddin defeated the army sent against him by the Mongol at Parwán, north of Cabul. Jenghiz then advanced and drove Jaláluddin across the Indus, after which he sent Okkodai his son to besiege Ghazni. Henceforward Ghazni is much less prominent in Asiatic history. It continued subject to the Mongols, sometimes to the house of Huláků in Persia, and sometimes to that of Chaghatai in Turkestan. In 1326, after a hattle between Amir Husain, the viceroy of the former house in Khorasan, and Tarmashirín, the reigning khan of Chaghatai, the former entered Ghazni and once more subjected it to devastation, and this time the tomb of Mahmúd to desecration. The statement in a recent hook on Afghanistan, that a new Ghori dynasty reigned at *Ghazni* from 1336 to 1383, is erroneous.

Ihn Batuta (*c.* 1332) says the greater part of the city was in ruins, and only a small part continued to be a town. Timur seems never to have visited Ghazni, but we find him in 1401 bestowing the government of Cabul, Kandahar, and Ghazni on Pír Mahommed, the son of his son Jahángír. In the end of the century it was still in the hands of a descendant of Timur, Ulugh Beg Mirza, who was king of Cabul and Ghazni. The illustrious nephew of this prince, Baher, got peaceful possession of hoth cities in 1504, and has left notes on both in his own inimitable Memoirs. His account of Ghazni indicates how far it had now fallen. "It is," he says, "but a poor mean place, and I have always wondered how its princes, who possessed also Hindustan and Khorasan, could have chosen such a wretched country for the seat of their government, in preference to Khorasan." He commends the fruit of its gardens, which still contribute largely to the markets of Cabul. Ghazni remained in the hands of Baber's descendants, reigning at Delhi and Agra, till the invasion of Nadir Shah (1738), and became after Nadir's death a part of the new kingdom of tho Afghans under Ahmed Sháh Durráni. We know of but two modern travellers who have recorded visits to the place previous to the war of 1839. George Forster passed as a disguised traveller with a kafila in 1783. "Its slender existence," ho says, "is now maintained by some Hindu families, who support a small traffic, and supply the wants of the few Mahometan residents." Mr. Vigne visited it in 1836, having reached it from Multan with a caravan of Lohání merchants, travelling by the Gomal pass. The historical name of Ghazni was hrought back from the dead, as it were, by the news of its capture hy the British army under Sir John Keane,[1] 23d July, 1839. The siege artillery had been left hehind at Kandahar; escalade was judged impracticable; but the project of the commanding engineer, Captain George Thomson, for blowing in the Cabul gate with powder in bags, was adopted, and carried out successfully, at the cost of 182 killed and wounded. Two years and a half later, the Afghan outbreak against the British occupation found Ghazni garrisoned by a Bengal regiment of sepoys, but neither repaired nor provisioned. They held out under great hardships from 16th December, 1841, to 6th March, 1842, when they surrendered. In the autumn of the same year General Nott, advancing from Kandahar upon Cabul, reoccupied Ghazni, destroyed the defences of the castle and part of the town, and carried away the famous gates. Since then Ghazni has not been entered by any Englishman; for when Colonel Lumsden's mission passed this way in 1857 they were not allowed to approach the place.

Soc. of Bengal*, vol. xii.; *Autobiography of Baber*, by Leyden and Erskine; Cunningham's *Hist. of the Sikhs*, etc. (H. Y.)

GHEE (Sanskrit, *Ghrita*), a kind of clarified butter made in the East. The best is prepared from butter of the milk of cows, the less esteemed from that of buffaloes. The butter is melted over a slow fire, and set aside to cool; the thick, opaque, whitish, and more fluid portion, or ghee, representing the greater bulk of the butter, is then removed. The less liquid residue, mixed with groundnut oil, is sold as an inferior kind of ghee. It may be obtained also, according to the *Indian Domestic Economy and Receipt Book*, p. 16, 6th ed., 1865, by boiling butter over a clear fire, skimming it the while, and, when all the water has evaporated, straining through a cloth. Ghee which is rancid or tainted, as is often that of the Indian bazaars, is said to be rendered sweet by boiling with leaves of the *Moringa pterygosperma* or horse-radish tree. In India ghee is one of the commonest articles of diet, and indeed enters into the composition of everything eaten by the Brahmans. It is also extensively used in Indian religious ceremonies, being offered as a sacrifice to idols, which are at times bathed in it. Sanskrit treatises on therapeutics describe ghee as cooling, emollient, and stomachic, as capable of increasing the mental powers, and of improving the voice and personal appearance, and as useful in eye-diseases, tympanitis, painful dyspepsia, wounds, ulcers, and other affections. Old ghee is in special repute among the Hindus as a medicinal agent, and its efficacy as an external application is believed by them to increase with its age. Ghee more than 10 years old, the *purána ghrita* of Sanskrit materia medicas, has a strong odor, and the color of lac. Some specimens which have been much longer preserved—and "clarified butter a hundred years old is often heard of"—have an earthy look, and are quite dry and hard, and nearly inodorous. Medicated ghee (Sanskrit, *ghrita páka*) is made by warming ordinary ghee to remove contained water, melting, after the addition of a little turmeric juice, in a metal pan at a gentle heat, and then boiling with the prepared drugs till all moisture is expelled, and straining through a cloth.

See Udoy Chand Dut, *The Materia Medica of the Hindus, compiled from Sanskrit Medical Works*, Calcutta, 1877, and, on the uses of ghee in culinary operations, the above quoted *Receipt Book*, and *The Indian Cookery Book*, Calcutta (1869?).

GHEEL, or Geel, a town of Belgium, in the province of Antwerp, about 25 miles E. of Antwerp, on the railway between Herenthals and Moll, with a population, according to the census of 1900 of 13,070. Situated in the midst of that half barren stretch of moorland which is known as the Campine or Kampenland, it would have been of little importance, in spite of its manufactures of cloth, leather, wooden shoes, and wax-lights, had it not for long centuries been the seat of a unique method of dealing with the insane. A local legend, tracing the origin of the town back to a chapel of St. Martin erected in the 7th century, goes on to tell how an Irish princess, fearing the fate that long afterwards befell Beatrice Cenci, sought refuge in this remote asylum, but was pursued by her relentless father and put to death, along with a priest Gerrebert, the companion of her flight. The tomb of the victims was soon discovered to have a healing virtue for minds diseased; the sainted Dymphna became the patroness of the insane, and a large and beautiful church in her honor was erected on the site of St. Martin's chapel. Commenced in the 12th century, it was finished in 1340, and consecrated by the bishop of Cambray; and the pilgrimages to the tomb were sanctioned

[1] [Lieutenant-general Baron Keane (1781–1844) fought at New Orleans under Pakenham, and was commander-in-chief in Jamaica and Bombay.—Am. Ed.]

by a brief of Eugenius IV. In 1538 Jean de Mérode, within whose domains the church was situated, instituted a vicariate of nine priests and a director, and in 1562 Henri de Mérode transformed the vicariate into a regular chapter of nine canons and a dean. The church still remains to bear witness to the importance formerly attached to the shrine; and though the tomb of St. Dymphna has long been a cenotaph, a few stray enthusiasts still pass beneath it in hopeful imitation of the thousands in bygone years, whose knees have worn deep furrows in the pavement as they made their ninefold transits on nine successive days. As food and lodging had to be provided for the patients who were brought to the saint, the inhabitants of Gheel grew accustomed to the treatment of the various kinds of mental alienation, and gradually discovered that forcible measures were much less frequently necessary, and danger less likely to result from free intercourse with the insane, than was generally believed throughout Europe. When M. Pontecoulant was appointed by Napoleon prefect of the Revolution department of the Dyle, his attention was called to the success of the domestic régime in force at Gheel, in contrast to the sad condition of affairs in the asylum at Brussels, and he caused the patients to be removed from the capital to the little country town. His example was freely followed by the authorities of different districts, and Gheel received full official recognition. Investigations undertaken about 1850 by M. Ducpétiaux, inspector-general of benevolent establishments in Belgium, resulted in the reform of such abuses as had crept into the system; and the relations of the patient and his protectors were placed on a strict legal footing by the law of 1st May, 1851. Further ameliorations have been introduced in 1852, 1857, 1858, etc. The whole management of the system is under the supervision of officially appointed physicians, and the advantages of a regular establishment are thus combined with those of domestic comfort, social freedom, and activity. Permission to receive patients is granted not only to the town residents, but also to the villagers of the vicinity.

Among the numerous works and papers descriptive of Gheel and its régime, the following may be mentioned:—Gazot, *Hist. ecclésiastique des Pays Bas*, 1614; Biffi, "Memorie originali," in *Gazetta Medica Italiana*, 2d Oct., 1854; Brown, in *Asylum Journal*, 1858; Bucknill, *Ibid.*, 1858, 1859; Bulckens, *Rapport*, etc., Brussels, 1857; papers by Auguste Droste, in *Allg. Zeitsch. für Psychiatrie*, 1853, *Corr. Blätter der Deutschen Ges. für Psychiatrie*, 1856, *Hygea*, 1857, and *Deutsche Klinik*, 1858; Esquirol, *Mal. mentales*, vol. ii.; Jules Duval, *Gheel, ou Une colonie d'aliénés*, Paris, 1860; Ruedy, *Gheel, Beitrag zur Gesch. der prakt. Psychiatrie*, Berlin, 1875.

GHENT, in Low Latin *Ganda* or *Gandavum*, in French *Gand*, in Flemish *Gend*, in German *Gent*, a city of Belgium, at the head of the province of East Flanders, is situated about 30 miles to the west of Antwerp on the Scheldt and the Lys. The two streams branch out to such an extent as to partition the town into 26 islands, which are connected by about 270 bridges, 42 being of stone, and 28 of the others being wooden structures of considerable size. In general Ghent is well built, and, though the older portion has narrow and gloomy lanes, it occupies as a whole a larger area than most European towns in proportion to the population and the number of houses. A striking and pleasing feature is the number of promenades, the most noteworthy being the Coupure or "Cutting," so called from the branch of the Bruges canal constructed in 1758. Gardens, orchards, and corn-fields are enclosed within the ancient boundaries of the walls, which extended nearly 8 miles in circumference. An excellent view of the city and its environs is obtained from the belfry of the grand old watch-tower erected by the men of Ghent between 1183 and 1339, from whose summit the voice of the famous bell Roland called the burghers together for fire or fray. The present spire of cast iron dates from 1854, but it is still surmounted by the golden dragon brought to Ghent from the church of St. Sophia in Constantinople, not long after the conquest of that city by the crusaders. Roland was removed by Charles V., and its place is now supplied by a chime of 44 bells.

Almost all the houses of the wealthier classes of Ghent are constructed after the Italian fashion, with wide portes-cochères, spacious courtyards, and lofty staircases; but along the quays and in the older streets there are still numerous specimens of the quainter and grander architecture of the 16th and 17th centuries. The industrial classes live for the most part in long monotonous rows of poor-looking houses. Among the public squares the most noteworthy are the Friday Market (*Marché du Vendredi*), where in former days the counts of Flanders were inaugurated and the trades unions used to assemble; the *Kauter* (the word in Flemish means field), which became the Place d'Armes in 1812, and is the favorite rendezvous of the fashionable world; the Plaine de St. Pierre, especially used for military reviews; the Corn Market, which is one of the busiest spots in the town; and the Place Sainte Pharaïlde, which con-

tains the façade of the fish-market and the gate of the Counts' Castle, and is annually the scene of the so-called Fair of the Little Presents (*Presentjesmarkt*). The Plaine des Recollets, which takes its name from the convent of the Reformed Franciscans (1225–1796), was in 1836 chosen as the site of the new court-house. Near the Friday Market is an enormous cannon, 18 feet long, 10 feet in girth, and nearly 3 feet wide at the mouth, formed in the same fashion as "Mons Meg" in Edinburgh Castle, and surnamed *Dulle Griete*, or "Mad Meg or Margaret."

The cathedral of St. Bavon (Flem. *Baefs*) ranks as one of the most splendid of the churches of Belgium. Though the original foundation dates from the 9th or 10th century, the crypt and choir of the actual edifice have no higher antiquity than the 13th century, and the other parts were not completed till the 16th. The roof of the nave has been erected since the destructive fire of 1822. Originally dedicated to St. John, the church received its present name

only in 1540, when Charles V. made it the seat of the collegiate chapter of the abbey of St. Bavon; and it was not till 1559 that it was constituted a cathedral at the request of Philip II. of Spain. In its exterior St. Bavon's is rather heavy in style, but it is surmounted by a fine octagonal tower, which, before the destruction of the spire by lightning in 1603, had a height of 360 feet, and still reaches 270 feet. The interior is remarkable for the richness and variety of its decorations. The choir and transepts are lined with black marble, and the balustrades are of white or variegated marble. A statue of St. Bavon in his ducal robes adorns the high altar, and in front are four tall copper candlesticks which belonged to Charles I., and bear the royal arms of England. Beneath the windows of the choir are affixed the arms of the knights of the golden fleece, whose last chapter was held by Philip II. in St. Bavon's in 1559. The chapels are twenty-four in number; their gates are of brass, and almost every available spot has its painting or statue. The eleventh is known as the Chapel of the Lamb, as it contains the central and principal portion of the famous Adoration of the Lamb painted by John Van Eyck in 1432. Hubert Van Eyck, his brother and compeer, and Margaret, his sister, lie buried in the crypt. The church of St. Nicholas —an early Gothic structure, with a great tower of the 15th century and a modern portico—has the credit of being the oldest in the town; and St. Michael's, dating from about 1450, but frequently restored, is memorable as the scene of the worship of reason during the French Revolution. Previous to the Revolution there existed in Ghent a large number of convents and monasteries (thirty-seven establishments of this class, with 1122 inmates, are recorded in 1781); and one of its most famous institutions at the present day is the Béguinage of St. Elizabeth, a community of about 600 or 700 nuns, who inhabit a separate quarter of the town, consisting of little brick-built cottages arranged in streets and squares within a common wall.

Among the secular buildings of Ghent one of the finest is the Hôtel de Ville, its northern façade being an exceptionally rich example of flamboyant Gothic of the 15th century, and its eastern façade presenting a curious contrast, with its rows of Doric, Ionic, and Corinthian columns after the style of the Italian Renaissance. The court-house or palais de justice is a heavy but imposing structure in the Romanesque manner, erected between 1835 and 1843 by the architect Roelandt at the common expense of the state, the province, and the town. The minor apartments of the lower floor have been all more or less sacrificed to the great Hall of the Lost Footsteps, which is 240 feet long and 70 feet wide. About the same time the same architect was entrusted with the designs for the casino, a building adapted for the flower-shows of the Botanical Society and the concerts of the choral union of St. Cecilia. The so-called Government house, which is partly occupied by the provincial administration and partly by the governor as his residence, was assigned by Charles V. to the provost of St. Bavon, became in 1581 the property of William of Orange (the Silent), at a later date served as episcopal palace, and in the time of Napoleon was the prefecture. The present episcopal palace was built in 1845 as an appendage to the cathedral.

With benevolent institutions of various kinds Ghent is abundantly supplied. A lunatic asylum, the Hospital of the Byloque, founded as early as 1225, a maternity hospital dating from 1827, a blind asylum (1854) due to the beneficent bequests of L. Van Caneghem, a deaf and dumb institution (1822), and an *atelier de charité*, or establishment for giving work to the unemployed, which has been in operation since 1817, are worthy of special mention. It would be less of a paradox than might be supposed if the great penitentiary (Rasphuis, or Maison de Force) had been included in the list; for it is remarkable, not only for the sumptuous style of its buildings, but for the philanthropic character of its administration. It was erected between 1772 and 1825 at a cost of 2,150,000 francs, and can accommodate 2600 prisoners.

The spacious university buildings were erected between 1819 and 1826, at the expense of the city, under the auspices of William I., king of Holland. They were designed by Roelandt in the Greek style, and one of the principal features is a portico after the model of the Pantheon at Rome. The university library, containing upwards of 100,000 volumes, and reckoned one of the most valuable in Belgium, was formerly the property of the town. Along with the royal athenæum or high school, it occupies the old abbey of Baudeloo, founded by Baldwin of Constantinople in 1199. The abbey gardens were transformed in 1797 into a botanical garden, which now ranks as one of the finest in Europe. A royal academy for the encouragement of art, founded in 1751 by Charles Marissal, and a musical conservatory originated by the communal council in 1835, are both flourishing institutions; and the technical school with about 800 pupils is one of the very best in Belgium. The Natural History Society, dating from 1851 has established a zoological garden.

Though Ghent has no longer the industrial pre-eminence that it enjoyed in the 14th and 15th centuries, it is still the principal seat of the cotton and leather manufactures of Belgium. Flax-spinning, calico-printing, and sugar-refining are also extensively carried on, and there are engineering works, chemical works, iron-foundries, soap-works, paper-mills, and breweries. No fewer than sixty considerable firms, trading with Germany, France, Italy, and Russia, are engaged in commercial floriculture; and, as a consequence, the flower-shows of Ghent, as they were perhaps the earliest, are still among the finest exhibitions of the kind in Europe. The trade of the town, which deals mainly with the products and raw materials of the industries, is fostered by a good railway system and numerous canals. There is direct communication with the sea by a grand canal, which, however, unfortunately for the Belgians, enters the sea at Terncuse in Dutch territory. The harbor, completed in 1828, is capable of accommodating 400 vessels, and vessels drawing 17 feet of water can unload under the walls of the town. At Sas van Gend, 15 miles north of the city, on the frontier of Holland, there are sluices by which the district can be laid under water.

In 1812 Ghent had no more than 55,161 inhabitants; by 1856 they had increased to 109,668, and by 1869 to 121,469. The census of 1906 gave 163,079. Among the celebrities born in the city are Henry Goethals, distinctively Henry of Ghent, a famous theologian and member of the Sorbonne (d. 1295); Philippe Mouskes, the chronicler; P. Vanderberghe or Montanus, the geographer; Daniel Heinsius; Jacques van Zevecote, one of the principal Flemish poets; Lauren Delvaux, a sculptor; C. L. Diericx, the local historian; and J. Guislain, the lunacy physician.

The investigations of local antiquaries leave it still doubtful whether Ghent had a Roman origin, as Petrarch supposed (*Gandavum Cæsare conditore superbum*). That there was a military fortress on the spot in the 7th century, is proved by Baudemont's life of St. Amand, the first missionary of Christianity in the district (*Acta Sanctorum*, vol. i.). Of the two monasteries founded by the saint in honor of St. Peter, the one near the Antwerp gate was richly endowed by St. Bavon, and his name became attached, not only to the building, but to the part of the city. About the year 1000 Baldwin Ironarm, first count of Flanders, took possession of Ghent, and a few years after he erected the Gravensteen or Counts' Castle. Trade and manufactures, especially of linen and woollen, were encouraged by Baldwin and his successors, and by the close of the 12th century the men of Ghent were able to purchase commercial and political privileges, and to establish a form of municipal government. They established a court of justice, elected sheriffs, joined the association of the Hanse Towns, and obtained the free navigation of the Rhine from the emperor Frederick I. By the charter of 1192 they obtained the right of fortifying their city, and the first circumvallation carried out between that date and 1214 had a development of 6560 feet. By the end of the 13th century Ghent was a greater city than Paris. In the 14th, under the leadership of the famous Jacob van Artevelde and his son Philip (1332–1382), it raised frequent insurrections against the counts of Flanders, and took a prominent part in the political movements of the Low Countries. In 1385 it was obliged to submit to the duke of Burgundy, but its rights and privileges were left uninjured. At the commencement of the 15th century it had upwards of 40,000 men employed in the woollen manufactures alone, and was able to place in the field from 18,000 to 20,000 men-of-arms. When in 1452 the duke of Burgundy, Philip the Good, imposed a tax on salt and grain, it rose in rebellion, but after a few years' conflict the defeat at Gaveren left it at the duke's mercy. The independence of the burghers was far from being crushed. They showed themselves as turbulent as ever under Mary of Burgundy, who made the city her principal residence; and when she made certain unpopular concessions to Louis XI., they took the law into their hands, and on April 3, 1477, put to death in her presence the two councillors Hugonet and Himber-Court, whom she had intrusted with the mission. After her marriage at Ghent (August 17) with Maximilian of Austria, matters were more

peaceful. On Mary's death in 1482 the discontent of the people again broke out. In 1488 they restored their ancient form of government, and held out against the emperor Frederick, who led an army against them in person, but at length in 1492 they came to terms. In 1500 Charles V. was born in the palace at Ghent, the site of which is now occupied by the street called the Cour des Princes. His reign was a critical one for the city, for though it had a population of 175,000, it was but a drop in the bucket of his vast dominions, and he treated it with but little consideration. When in 1536 his sister Maria, at that time in command of the Netherlands, demanded the extraordinary subsidy of 1,200,000 gold florins from Flanders, the citizens refused to contribute, and in 1539 they took arms in self-defence. Charles himself appeared on the scene in 1540, forced them to submission, deprived them of their privileges, executed 26 of the principal leaders of the revolt, confiscated the public buildings, and erected a citadel at a total expense of 411,334 livres, the greater part of which had to be defrayed by Ghent itself. Even this did not crush the spirit of the city. It was by the pacification of Ghent, signed in the town-hall Nov. 8, 1578, that Holland and Zeeland, and the southern states of the Netherlands, formed an alliance against the Spanish supremacy, and three days after the Spanish garrison capitulated to the citizens. In 1584, however, the duke of Parma captured the town for Philip, and the citadel, which had been almost completely demolished, was restored. The attempts of the French in 1641 and 1642 to get possession of Ghent were frustrated by laying the country under water; but in 1678, though in the mean while the fortifications had been considerably extended, the feeble garrison under Don Francisco de Pardo was unable to defend the place against Marshals Humières, Luxembourg, Schomberg, and Vauban. Ghent continued in French hands till the peace of Nimwegen. It played an important part in the war of the Spanish succession, being captured in 1706 by Marlborough, recovered in 1708 by the French Marquis de Grimaldi, and again captured by Marlborough in 1709. In the war of the Austrian succession, Louis XV. made his entry into the city on 25th July, 1745, and remained in possession till the treaty of Aix-la-Chapelle in 1748. By order of Joseph II. in 1781, the citadel and fortifications were dismantled, and the grounds on which they were built were sold. Under the régime of the French Revolution the city was made the chief town of the department of the Scheldt. By the peace of Paris (1814) it passed with Belgium to Holland; but it took an active part in the movement for the separation of the two kingdoms, and after the separation was accomplished (1830) continued to be the headquarters of the agitation of the Orange party. On the recommendation of the duke of Wellington, who visited the town in 1821 to give his opinion on the plans, a new citadel was erected according to the designs of M. Gey van Pittius (1822–1830).

GHENT, Jodocus, or Justus, of (1465–75). The public records of the city of Ghent have been diligently searched, but in vain, for a clue to the history of Justus or Jodocus, whom Vasari and Guicciardini called Giusto da Guanto. Flemish annalists of the 16th century have enlarged upon the scanty statements of Vasari, and described Jodocus as a pupil of Hubert Van Eyck. But there is no source to which this fable can be traced. The registers of St. Luke's guild at Ghent comprise six masters of the name of Joos or Jodocus who practised at Ghent in the 15th century. But none of the works of these masters have been preserved, and it is impossible to compare their style with that of Giusto. It was between 1465 and 1474 that this artist executed the Communion of the Apostles which Vasari has described, and modern critics now see to the best advantage in the museum of Urbino. It was painted for the brotherhood of Corpus Christi at the bidding of Frederick of Montefeltro, who was introduced into the picture as the companion of Caterino Zeno, a Persian envoy at that time on a mission to the court of Urbino. From this curious production it may be seen that Giusto, far from being a pupil of Hubert Van Eyck, was merely a disciple of a later and less gifted master, who took to Italy some of the peculiarities of his native schools, and forthwith commingled them with those of his adopted country. As a composer and draughtsman Giusto compares unfavorably with the better known painters of Flanders; though his portraits are good, his ideal figures are not remarkable for elevation of type or for subtlety of character and expression. His work is technically on a level with that of Gerard of St. John, whose pictures are preserved in the Belvedere at Vienna. Vespasian, a Florentine bookseller who contributed much to form the antiquarian taste of Frederick of Montefeltro, states that this duke sent to the Netherlands for a capable artist to paint a series of "ancient worthies" for a library recently erected in the palace of Urbino. It has been conjectured that the author of these "worthies," which are still in existence at the Louvre and in the Barberini palace at Rome, was Giusto. Yet there are notable divergences between these pictures and the Communion of the Apostles. Still, it is not beyond the range of probability that Giusto should have been able, after a certain time, to temper his Flemish style by studying the masterpieces of Santi and Melozzo, and so to acquire the mixed manner of the Flemings and Italians which these portraits of worthies display. Such an assimilation, if it really took place, might justify the Flemings in the indulgence of a certain pride, considering that Raphael not only admired these worthies, but copied them in the sketch book which is now the ornament of the Venetian Academy. There is no ground for presuming that Giusto da Guanto is identical with Justus d'Allamagna, who painted the Annunciation (1451) in the cloisters of Santa Maria di Castello at Genoa. The drawing and coloring of this wall painting show that Justus d'Allamagna was as surely a native of South Germany as his homonym at Urbino was a born Netherlander.

GHERARDESCA, Ugolino Della (*c.* 1220–1289), count of Donoratico and head of the Gherardeschi, one of the leading Ghibelline houses of Pisa, began to take part in public affairs about the time when the dissensions which had arisen about the partition of Sardinia had resulted in sending over the entire clan of the Pisan Visconti to the Guelphs. For having given his sister in marriage to one of these—Giovanni Visconti of Gallura—he was banished from Pisa by his own party, who seem to have had good reason otherwise for suspecting his loyalty; but he was permitted to return in terms of the peace of 1267. Notwithstanding the ambiguous character of his politics, he soon succeeded in gaining a high place in the public service of his native city; and in the battle of Meloria (6th August, 1284), which terminated the long war with Genoa, he was one of the three Pisan admirals. It was by his cowardly or traitorous flight at a critical moment, it is said, that the contest was decided in favor of the Genoese; but, be this as it may, whether by means of his treachery, or in spite of it, he almost immediately afterwards (October, 1284) was nominated by the citizens who remained to the twofold office of capitano and podestá for one year; and some months afterwards (February, 1285) this term was extended to ten years. In this capacity of virtual dictator he, by the banishment of ten leading Ghibelline citizens of Pisa, secured peace with the Florentines; he also endeavored to propitiate the Genoese by the offer of Castro in Sardinia, and the Lucchese by the actual surrender of Ripafratta and Viarreggio, but unsuccessfully. Meanwhile, though thoroughly alienated from the Ghibellines, he had not succeeded in gaining the confidence of the Guelphs; and in 1287 he was by them compelled to associate with himself in the government Nino Visconti, a nephew by the marriage already referred to, who had now reached manhood. But this arrangement was rendered nugatory by the disagreements of the two colleagues, and Ugolino found it necessary to resign his office in December of the same year. In his unscrupulous ambition after personal ascendency he now turned for support to the party he had so long deserted, and entered into an alliance with the Gualandi, Sismondi, Lanfranchi, and other uncompromising Ghibellines, who looked upon the archbishop Ruggiero degli Ubaldini as their head. But this unnatural combination soon terminated in an open rupture, the immediate occasion of which was the violence of Ugolino, who, on some sudden provocation, had killed a nephew of the archbishop. In August, 1288, he was beset in the Palazzo del Popolo by the Ghibellines, and, after fire had been set to the building, taken prisoner, along with his sons Gaddo and Ugoccione, and his grandsons Nino (surnamed Brigatto) and Anselmuccio. (Some accounts mention a third grandson, named Henry.) After having been confined for twenty days in the Palazzo del Comune, they were removed to the Gualandi's Tower, Alle Sette Vie, afterwards called the Torre della Fame. Here

they were kept till March, 1289, when, by order of the archbishop, the door was locked and the keys thrown into the Arno. Nine days afterwards the tower was re-entered and the bodies removed to the church of San Francisco.

The story of Ugolino, though it is to be met with in other contemporary writers (see Villani, vii. cc. 120, 127), owes all its fame to Dante, who has placed him above Ruggiero on the inner margin of the second division (Antenora) of the ninth and lowest circle of his Inferno. Dante's powerful narrative, which includes "thirty lines unequalled by any other thirty in the whole dominions of poetry" (Landor), has been paraphrased, or rather almost translated, by Chaucer, in the *Monk's Tale*, and has also been reproduced in modern times by Shelley. It ought to be observed, however, with reference to Ugolino's alleged treachery, that the baser explanation of his conduct at Meloria is not to be met with in any document earlier than the 16th century; while with regard to the accusation of having sold the fortresses of Pisa to the Lucchese and Florentines, Dante, though evidently himself believing it, does not say more than that he "was alleged" (aveva voce) to have done so. Ruggiero's share in the murder of Gherardesca has sometimes been doubted, but on very inadequate grounds. Only in one respect can the poet be fairly accused of having absolutely departed from strict historical accuracy, namely, with regard to the age of the sons and grandsons, who, though represented by him as children, appear to have been all of them grown up. The narrative of Villani has already been referred to; references to other sources may be found in Sismondi and in the annotated editions of Dante, particularly in that of "Philalethes" (the late king of Saxony).

GHERIAH, a town and fortress of British India, in the presidency of Bombay, about 170 miles south of Bombay, otherwise called Viziadrug. See VIZIADRUG.

GHIBELLINES. See GUELPHS.

GHIBERTI, LORENZO (1378–1455), whose name alone is worthy to rank with that of Donatello amongst the grand Italian sculptors of the Renaissance, was born at Florence in the year 1378. He learned the trade of a goldsmith under his father Ugoccione, commonly called Cione, and his stepfather Bartoluccio; but the goldsmith's art at that time included all varieties of plastic arts, and required from those who devoted themselves to its higher branches a general and profound knowledge of design and coloring. In the early stage of his artistic career Ghiberti was best known as a painter in fresco, and when his native city Florence was visited by the plague, he repaired to Rimini, where he executed a highly prized fresco in the palace of the sovereign Pandolfo Malatesta. He was recalled from Rimini to his native city by the urgent entreaties of his stepfather Bartoluccio, who informed him that a competition was to be opened for designs of a second bronze gate in the baptistery, and that he would do wisely to return to Florence and take part in this great artistic contest. The subject for the artists was prescribed,—the sacrifice of Isaac; and the competitors were required to observe in their work a certain conformity to the first bronze gate of the baptistery, executed by Andrea Pisano about 100 years previously. Of the six designs presented by different Italian artists, those of Donatello, Brunelleschi, and Ghiberti were pronounced the best, and of the three Brunelleschi's and Ghiberti's superior to the third, and of such equal merit that the thirty-four judges with whom the decision was left entrusted the execution of the work to the joint labor of the two friends. Brunelleschi, however, withdrew entirely from the contest,—according to one account, from his cordial admiration of Ghiberti's genius, according to another, from his unwillingness to share so great an undertaking with any fellow-laborer. The first of his two bronze gates for the baptistery occupied Ghiberti twenty years, and when completed was justly regarded as the greatest work of its kind since the most glorious days of Grecian art. Ghiberti brought to his task a deep religious feeling and the striving after a high poetical ideal which are not to be found in the works of Donatello, though in power of characterization the second sculptor often stands above the first. Like Donatello, he seized every opportunity of studying the remains of ancient art; but he sought and found purer models for imitation than Donatello, through his excavations and studies in Rome, had been able to secure. The council of Florence, which met during the most active period of Ghiberti's artistic career, not only secured him the patronage of the pontiff, who took part in the council, but enabled him, through the important connections which he then formed with the Greek prelates and magnates assembled in Florence, to obtain from many quarters of the Byzantine empire the precious memorials of old Greek art, which he studied with untiring zeal. The unbounded admiration called forth by Ghiberti's first bronze gate led to his receiving from the chiefs of the Florentine guilds the order for the second, of which the subjects were likewise taken from the Old Testament. The Florentines gazed with especial pride on these magnificent creations, which must still have shone with all the brightness of their original gilding when, a century later, Michel Angelo pronounced them worthy to be the gates of paradise.[1] Next to the gates of the baptistery Ghiberti's chief works still in existence are his three statues of St. John the Baptist, St. Matthew, and St. Stephen, executed for the church of San Michele, among which three works, from the ideal character of the entire figure and the peculiar felicity of expression, the palm is generally awarded to the St. Stephen. In the bas-relief of the coffin of St. Zenobio, in the Florence cathedral, Ghiberti put forth much of his peculiar talent, and though he did not, as is commonly stated, execute entirely the painted glass windows in that edifice, he furnished several of the designs, and did the same service for a painted glass window in the church of San Michele. He died at the age of 77.

We are better acquainted with Ghiberti's theories of art than with those of most of his contemporaries, for he left behind him a commentary, in which, besides his notices of art, he gives much insight into his own personal character and views. Every page attests the religious spirit in which he lived and worked. Not only does he aim at faithfully reflecting in his creations Christian truths; he regards the old Greek statues with a kindred feeling, as setting forth the highest intellectual and moral attributes of human nature. He appears to have cared as little for money as Donatello, and expressly thanks heaven that he had not been cursed with a sordid and mercenary spirit, but had ever loved and labored at art for art's own sake.

Benvenuto Cellini's criticism on Ghiberti that in his creations of plastic art he was more successful in small than in large figures, and that he always exhibited in his works the peculiar excellences of the goldsmith's quite as much as those of the sculptor's art, is after all no valid censure, for it merely affirms that Ghiberti faithfully complied with the peculiar conditions of the task imposed upon him. More frequent have been the discussions of late years as to the part played by perspective in his representations of natural scenery. These have acquired a fresh importance since the discovery of the data, from which it now appears that Paolo Uccello, commonly regarded as the first great master of perspective, worked for several years in the studio or workshop of Ghiberti, and it becomes difficult to determine to what extent Uccelli's successful innovations in perspective were due to Ghiberti's teaching.

Cicognaro's criticism on Ghiberti, in his *History of Sculpture*, has supplied the chief materials for the illustrative text of Lasinio's series of engravings of the three bronze gates of the baptistery. They consist of 42 plates in folio, and were published at Florence by Bardi in 1821. Still more vivid representations are the reproductions on a very large scale by the photographic establishment of Alinari. In the Florence edition of Vasari's *Lives* there is given at full length Ghiberti's commentary on art. Both Mr. Perkins, in his *History of Tuscan Sculpture*, and Mr. Rio, in his *Art Chrétien*, have treated Ghiberti's works with much fulness, and in a spirit of sound appreciation. But the most recent contributions to what may be termed the Ghiberti literature are the chapter expressly devoted to the history of the competition for the baptistery gates in Semple's *Donatello* (Vienna, 1875), and the articles by Adolf Rosemberg in Dohme's *Kunst und Künstler des Mittelalters* (Leipsic, 1877).

GHILAN, or GILAN, a province of Persia, lying along the S. W. shore of the Caspian, separated from the Russian district of Talish by the Astara and bounded W. by Azerbijan, S. by Irak Adjemi, and S. E. by Mazanderan. It is about 150 miles in length, with a breadth varying from 15 to 50 miles; and its area is estimated at from 4500 to 5000 square miles. The greater portion of the province is a lowland region shut in by the mountains of the Elburz range; and though the Kyzyl Usen, which has its sources in the mountains of Kurdistan, is the only river of any size, the country is abundantly watered, and vast stretches of swamp are found in various directions. This is mainly

[1] Through long exposure to the dusty atmosphere of the town they have of late years begun to lose considerably in delicacy of outline; and it is much to be feared that, unless measures are speedily taken for their preservation, they will at no distant period suffer a still more marked deterioration.

due to the character of the climate, which is distinguished by a very heavy precipitation both in winter and summer. Vegetation is almost tropically luxuriant, and the forests are as dense as an Indian jungle. Oaks, maples, ash trees, *planeras*, lime trees, and *parrottias*, are among the prevailing types. The chestnut-leaved oak attains colossal proportions, and a height at times of 130 or 140 feet; and the box tree comes to rare perfection, and forms an important source of wealth. Vines and pomegranates, walnuts, plums, pears, and apples grow wild; and oranges, lemons, peaches, and other fruits are easily cultivated, though sometimes a severe winter proves fatal to the trees. The olive succeeds well in the valley of the Sefudrood, but the oil is extracted in a very primitive manner. Rice is largely cultivated, and forms the principal food of the inhabitants, except in the west, where its place is partially taken by wheat, a cereal indeed to which the Ghilanese farmer is more and more directing his attention. Cotton and sugar are both grown in small quantities, and the character of the climate gives reason to hope that tea plantations may be rendered profitable in some districts. Hitherto the most successful occupation has been silk growing; but frequent failures in the crop have disheartened, if they have not ruined, many of the silk-masters. The quantity produced in 1866 was valued at £743,300, while the average between 1870 and 1875 was only about £270,000. In quality the silk does not rank very high, the greater portion being the produce of Japanese seed. Animal life is nearly as well represented in Ghilan as vegetable life. Tigers, wild boars, deer, and a considerable variety of snakes are found in the jungles; pheasants are a common form of game; aquatic birds of various kinds—pelicans, storks, heron, gulls, ducks, etc., swarm along the coast; and the fisheries in the Caspian are highly productive. The ordinary cattle, a small humped species like that of India, form an article of export; sheep and goats are not so plentiful, but they furnish very fine wool; and the horses are a hardy race, greatly prized in other parts of Persia, and especially in the capital. Wild horses are to be met with in the forests. Trade and commerce are in a very undeveloped state,—and no wonder when, with one trifling exception, there is no carriageable road in the province, and merchandise has to be transported on the backs of horses, mules, or camels. A striking instance of the primitive state of matters is furnished by Mr. Mounsey, who tells how the machinery ordered by the Shah from Europe for his new mint was allowed to go to ruin in the sand at Enzelli, because it was found impossible to provide for its conveyance. The port of Enzelli, though it boasts of a lighthouse and three small forts, is little more than a natural harbor, and in rough weather it is not accessible to the mail steamers, which in the ordinary course call once a week.

The administration of the province is nearly as primitive as its system of roads, and consists of nothing but machinery for the collection of the taxes, which yield about £63,000 to the royal revenue. The capital is Resht, and the administrative districts are Resht, Lahijan, Fomen, Gesku, Talishan, Sheft, Rustemabad, Rudbar, Menjech, Lengerood, Siah Kuh, and Dilman. Every able-bodied man is enrolled in a sort of frontier guard in the district of Talishan, but no regular police is maintained throughout the province. The population is of very various composition; but the main stock, including the Tats and the Gileki, is of Iranian origin. The Gilek is strongly built, but lank, and his complexion is a sort of olive or copper color; the Tat, on the other hand, has a tendency to corpulence, and his complexion is swarthy. According to different estimates, the inhabitants of the province number 150,000, 200,000, or 275,000; but it is more than usually difficult to ascertain the truth of the case, as they are for the most part scattered through the country in small hamlets. Ghilan is part of the ancient district of Hyrcania. The name is usually explained as equivalent to Mud-land; but Spiegel objects to this derivation, and says the true form of the word is Gelan, which has received no interpretation. There is nothing very distinctive about the history of the province; but its position, its climate, and its soil should secure it a flourishing future were its political condition improved.

GHIRLANDAJO, Domenico del (1449–1494), an illustrious Florentine painter. His full name is given as Domenico di Tommaso Curradi di Doffo Bigordi; it appears therefore that his father's surname was Curradi, and his grandfather's Bigordi. The painter is generally termed Domenico Bigordi, but some authors give him, and apparently with reason, the paternal surname Curradi. Ghirlandajo (garland-maker) was only a nickname, coming to Domenico from the employment of his father (or else of his earliest instructor), who was renowned for fashioning the metallic garlands worn by Florentine damsels; he was not, however, as some have said, the inventor of them. Tommaso was by vocation a jeweller on the Ponte Vecchio, or perhaps a broker. Domenico, the eldest of eight children, was at first apprenticed to a jeweller or goldsmith, probably enough his own father; in his shop he was continually making portraits of the passers-by, and it was thought expedient to place him with Alessio Baldovinetti to study painting and mosaic. His youthful years were, however, entirely undistinguished, and at the age of thirty-one he had not a fixed abode of his own. This is remarkable, as immediately afterwards, from 1480 onwards to his death at a comparatively early age in 1494, he became the most proficient painter of his time, incessantly employed, and condensing into that brief period of fourteen years fully as large an amount of excellent work as any other artist that could be named; indeed, we should properly say eleven years, for nothing of his is known of a later date than 1491.

In 1480 Ghirlandajo painted a St. Jerome and other frescoes in the church of Ognissanti, Florence, and a life-sized Last Supper in its refectory, noticeable for individual action and expression. From 1481–1485 he was employed upon frescoes in the Sala dell' Orologio in the Palazzo Vecchio; he painted the apotheosis of St. Zenobius, a work beyond the size of life, with much architectural framework, figures of Roman heroes, and other detail, striking in perspective and structural propriety. While still occupied here, he was summoned to Rome by Pope Sixtus IV. to paint in the Sixtine Chapel; he went thither not earlier than 1482. In the Sixtine he executed, probably before 1484, a fresco which has few rivals in that series, Christ calling Peter and Andrew to their Apostleship,—a work which, though somewhat deficient in color, has greatness of method and much excellence of finish. The landscape background, in especial, is very superior to anything to be found in the works, which had no doubt been zealously studied by Ghirlandajo, of Masaccio and Masolino in the Brancacci Chapel. He also did some other works in Rome, now perished. Before 1485 he had likewise produced his frescoes in the chapel of S. Fina, in the Tuscan town of S. Gemignano, remarkable for grandeur and grace,—two pictures of Fina, dying and dead, with some accessory work. Sebastian Mainardi assisted him in these productions in Rome and in S. Gemignano; and Ghirlandajo was so well pleased with his co-operation that he gave him his sister in marriage.

He now returned to Florence, and undertook in the church of the Trinita, and afterwards in S. Maria Novella, the works which have set the seal on his celebrity. The frescoes in the Sassetti Chapel of S. Trinita are six subjects from the life of St. Francis, along with some classical accessories, dated 1485. Three of the principal incidents are St. Francis obtaining from Pope Honorius the approval of the Rules of his Order; his Death and Obsequies; and the Resuscitation, by the interposition of the beatified saint, of a child of the Spini family, who had been killed by falling out of a window. In the first work is a portrait of Lorenzo de' Medici; and in the third the painter's own likeness, which he introduced also into one of the pictures in S. Maria Novella, and in the Adoration of the Magi in the hospital of the Innocenti. The altar-piece of the Sassetti Chapel, the Adoration of the Shepherds, is now in the Florentine Academy. Immediately after disposing of this commission, Ghirlandajo was asked to renew the frescoes in the choir of S. Maria Novella. This choir formed the chapel of the Ricci family, but the Tornabuoni and Tornaquinci families, then much more opulent than the Ricci, undertook the cost of the restoration, under conditions, as to preserving the arms of the Ricci, which gave rise in the end to some amusing incidents of litigation. The frescoes, in the execution of which Domenico had many assistants, are in four courses along the three walls,—the leading subjects being the Lives of the Madonna and of the Baptist.

Besides their general richness and dignity of art, these works are particularly interesting as containing many historical portraits—a method of treatment in which Ghirlandajo was pre-eminently skilled. There are no less than twenty-one portraits of the Tornabuoni and Tornaquinci families; in the subject of the Angel appearing to Zacharias, those of Poliziano, Marsilio, Ficino, and others; in the Salutation of Anna and Elizabeth, the beautiful Ginevra de' Benci; in the Expulsion of Joachim from the Temple, Mainardi and Baldovinetti (or the latter figure may perhaps be Ghirlandajo's father). The Ricci chapel was re-opened and completed in 1490; the altar-piece, now removed from the chapel, was probably executed with the assistance of Domenico's brothers, David and Benedetto, painters of ordinary calibre; the painted window was from Domenico's own design. Other distinguished works from his hand are an altar-piece in tempera of the Virgin adored by Sts. Zenobius, Justus, and others, painted for the church of St. Justus, but now in the Uffizi gallery, a remarkable masterpiece; Christ in glory with Romuald and other Saints, in the Badia of Volterra; the Adoration of the Magi, in the church of the Innocenti (already mentioned), perhaps his finest panel-picture, 1488; and the Visitation, in the Louvre, bearing the latest ascertained date, 1491, of all his works. Ghirlandajo did not often attempt the nude; one of his pictures of this character, Vulcan and his Assistants forging Thunderbolts, was painted for Lo Spedaletto, but (like several others specified by Vasari) it exists no longer. The picture attributed to him in the London National Gallery is dubious; it may perhaps have come from the atelier of Verrocchio. The mosaics which he produced date before 1491; one, of especial celebrity, is the Annunciation, on a portal of the cathedral of Florence.

In general artistic attainment Ghirlandajo may fairly be regarded as exceeding all his precursors or competitors; though the names of a few, particularly Giotto, Masaccio, Lippo Lippi, and Botticelli, stand higher for originating power. His scheme of composition is grand and decorous; his chiaroscuro excellent, and especially his perspectives, which he would design on a very elaborate scale by the eye alone; his color is more open to criticism, but this remark applies much less to the frescoes than the tempera-pictures, which are sometimes too broadly and crudely bright. He worked in these two methods alone—never in oils; and his frescoes are what the Italians term "buon fresco," without any finishing in tempera. A certain hardness of outline, not unlike the character of bronze sculpture, may attest his early training in metal work. He first introduced into Florentine art that mixture of the sacred and the profane which had already been practised in Siena. His types in figures of Christ, the Virgin, and angels are not of the highest order; and a defect of drawing, which has been often pointed out, is the meagreness of his hands and feet. It was one of his maxims that "painting is designing." Ghirlandajo was an insatiate worker, and expressed a wish that he had the entire circuit of the walls of Florence to paint upon. He told his shop-assistants not to refuse any commission that might offer, were it even for a lady's petticoat-panniers: if they would not execute such work, *he* would. Not that he was in any way grasping or sordid in money-matters, as is proved by the anecdote of the readiness with which he gave up a bonus upon the stipulated price of the Ricci chapel frescoes, offered by the wealthy Tornabuoni in the first instance, but afterwards begrudged. Vasari says that Ghirlandajo was the first to abandon in great part the use of gilding in his pictures, representing by genuine painting any objects supposed to be gilded; yet this does not hold good without some considerable exceptions—the high lights of the landscape, for instance, in the Adoration of the Shepherds, now in the Florence Academy, being put in in gold. Many drawings and sketches by this painter are in the Uffizi Gallery, remarkable for vigor of outline. One of the great glories of Ghirlandajo is that he gave some early art-education to Michelangelo, who cannot, however, have remained with him long. Granacci was another of his pupils.

This renowned artist died of pestilential fever on 11th January, 1494, and was buried in S. Maria Novella. He had been twice married, and left six children, three of them being sons. He had a long and honorable line of descendants, which came to a close in the 17th century, when the last members of the race entered monasteries. It is probable that Domenico died poor; he appears to have been gentle, honorable, and conscientious, as well as energetically diligent. (W. M. R.)

GHIRLANDAJO, Ridolfo (1483–1560), son of Domenico, was also a painter of considerable celebrity. Born on 14th February, 1483, and being thus less than eleven years old when his father died, he was brought up by his uncle David. To this second-rate artist he owed less in the way of professional training than to Granacci, Piero di Cosimo, and perhaps Cosimo Rosselli. It has been said that Ridolfo studied also under Fra Bartolommeo, but this is not clearly ascertained. He was certainly one of the earliest students of the famous cartoons of Leonardo da Vinci and Michelangelo. His works between the dates 1504 and 1508 show a marked influence from Fra Bartolommeo and Raphael, with the latter of whom he was on terms of familiar friendship; hence he progressed in selection of form and in the modelling and relief of his figures. Raphael, on reaching Rome in 1508, wished Ridolfo to join him; but the Florentine painter was of a particularly home-keeping humor, and he neglected the opportunity. He soon rose to the head of the Florentine oil-painters of his time; and, like his father, accepted all sorts of commissions, of whatever kind. He was prominent in the execution of vast scenic canvases for various public occasions, such as the Wedding of Giuliano de' Medici, and the Entry of Leo X. into Florence in 1515. In his prime he was honest and conscientious as an artist; but from about 1527 he declined, having already accumulated a handsome property, more than sufficient for maintaining in affluence his large family of fifteen children, and his works became comparatively mannered and self-repeating. His sons traded in France and in Ferrara; he himself took a part in commercial affairs, and began paying some attention to mosaic work, but it seems that, after completing one mosaic, the Annunciation over the door of the Nunziata, patience failed him for continuing such minute labors. In his old age Ridolfo was greatly disabled by gout. He appears to have been of a kindly, easy-going character, much regarded by his friends and patrons.

The following are some of his leading works, the great majority of them being oil-pictures:—

Christ and the Maries on the road to Calvary, now in the Palazzo Antinori, Florence, an early example, with figures of half life-size. An Annunciation in the Abbey of Montoliveto, near Florence, Leonardesque in style. In 1504, the Coronation of the Virgin, now in the Louvre. A Nativity, very carefully executed, now in the Hermitage, St. Petersburg, and ascribed in the catalogue to Granacci. A Predella, in the oratory of the Bigallo, Florence, five panels, representing the Nativity and other subjects, charmingly finished. In 1514, on the ceiling of the chapel of St. Bernard in the Palazzo Pubblico, Florence, a fresco of the Trinity, with heads of the twelve apostles and other accessories, and the Annunciation; also the Assumption of the Virgin, who bestows her girdle on St. Thomas, in the choir loft of Prato cathedral. Towards the same date, a picture showing his highest skill, replete with expression, vigorous life, and firm accomplished pictorial method, now in the gallery of the Uffizi, St. Zenobius resuscitating a child, also the Translation of the remains of the same Saint. The Virgin and various saints, at S. Pier Maggiore, Pistoja. In 1521, the Pietà, at S. Agostino, Colle di Valdelsa, life-sized. Towards 1526, the Assumption, now in the Berlin Museum, containing the painter's own portrait. An excellent portrait of Cosmo de' Medici (the Great) in youth. In 1543, a series of frescoes in the monastery of the Angeli. A great number of altar-pieces were executed by Ghirlandajo, with the assistance of his favorite pupil, currently named Michele di Ridolfo. Another of his pupils was Mariano da Pescia. (W. M. R.)

GHIZNI. See Ghazni.

GHOORKAS. See Nepal.

GHÚR (*Ghor, Ghoor, Gour*, etc.) is the name of a territory in Asia, and Ghúri (*Ghori, Ghoory*, etc.) that of a dynasty deriving its origin from that territory.

The name of Ghúr was, in the Middle Ages, and, indeed, locally still is, applied to the highlands east of Herat, and extending eastward to the upper Helmand valley, or nearly so. There is hardly any region of Asia regarding which we continue to be more in the dark than about this. Ghúr is the southern portion of that great peninsula of strong mountain country which forms the western part of modern Afghanistan, and which may be taken in a general way to represent the Paropamisus of the ancients. The northern portion of the said peninsula was in the Middle Ages comprehended under the names of *Gharjistán* (on the west), and *Juzjáná* (on the east), whilst the basin of the Herat

river, and all south of it, constituted Ghúr. The name as now used does not perhaps include the valley of the Herat river; on the south the limit seems to be the declivity of the higher mountains (about 32° 45′ N. lat.) dominating the descent to the lower Helmand, and the road from Farrah to Kandahar. It is in Ghúr that rise all those affluents of the closed basin of Seistán, the Harút, the Farrah-rúd, the Khásh-rúd (see AFGHANISTAN), besides other considerable streams joining the Helmand above Girishk.

Ghúr is mentioned in the Shahnamah of Firdousi (1010 A. D.), and in the Arab geographers of that time, though these latter fail in details almost as much as we moderns, thus indicating how little accessible the country has been through all ages. Ibn Haukal's map of Khorasan (*c.* 976) shows *Jibál-al-Ghúr*, "the hill-country of Ghúr," as a circle ring-fenced with mountains. His brief description speaks of it as a land fruitful in crops, cattle, and flocks, inhabited by infidels, except a few who passed for Mahometans, and indicates that, like other pagan countries surrounded by Moslem populations, it was regarded as a store of slaves for the faithful. The boundary of Ghúr in ascending the valley of the Hari-rúd was six and a half easy marches from Herat, at Chist, two marches above Obah (both of which are still in our maps).

The chief part of the present population of Ghúr are *Taimúnis* belonging to the class of nomad or semi-nomad clans called *Eimáks* (see AFGHANISTAN, vol. i. p. 211). There are also, according to Ferrier, *Súris*, who were formerly the main part of the population, apparently the same as the *Zoorees* of Elphinstone (*Caubul*, ii. 204), another of the Eimák clans; and in the north of Ghúr Ferrier mentions Mongols. Camels are kept in great numbers by the Eimáks, chiefly for their wool. Though the country is very mountainous, there are fruitful valleys of considerable width. But our knowledge is too slight for us to say more.

The people and princes of Ghúr first become known to us in connection with the Ghaznevid dynasty, and the early mediæval histories of Ghúr and Ghazni are so intertwined that little need be added on that subject to what will be found under GHAZNI (*q. v.*). What we read of Ghúr shows it as a country of lofty mountains and fruitful valleys, and of numerous strongholds held by a variety of hill-chieftains ruling warlike clans whose habits were rife with feuds and turbulence,—indeed, in character strongly resembling the tribes of modern Afghanistan, though there seems no good reason to believe that they were of Afghan race. It is probable that they were of old Persian blood, like the older of those tribes which still occupy the country. It is possibly a corroboration of this that, in the 14th century, when one of the Ghúri kings, of the Kurt dynasty reigning in Herat, had taken to himself some of the insignia of independent sovereignty, an incensed Mongol prince is said to have reviled him as "an insolent *Tajik*" (*Journal Asiat.*, ser. v. tom. xvii. p. 509). Sahuktigín of Ghazni, and his famous son Mahmúd, repeatedly invaded the mountain country which so nearly adjoined their capital, subduing its chiefs for the moment, and exacting tribute; but when the immediate pressure was withdrawn, the yoke was thrown off, and the tribute withheld. In 1020 Masa'ud, the son of Mahmúd, being then governor of Khorasan, made a systematic invasion of Ghúr from the side of Herat, laying siege to its strongholds one after the other, and subduing the country more effectually than ever before. About a century later one of the princely families of Ghúr, deriving the appellation of Shansahi, or Shansabániah, from a certain ancestor Shansab, of local fame, and of alleged descent from Zohák, acquired predominance in all the country, and at the time mentioned Malik 'Izzuddin al Husain of this family came to be recognized as lord of Ghúr. He was known afterwards as "the Father of Kings," from the further honor to which several of his seven sons rose. Three of these (see GHAZNI) were —(1) Amir Kutbuddin Mahommed, called the lord of the Jibál or mountains; (2) Sultán Saifuddín Súrí, for a brief period master of Ghazni,—both of whom were put to death by Bahram the Ghaznevid: and (3) Sultán Aláuddín Jahánsoz, who wreaked such terrible vengeance upon Ghazni. Aláuddín began the conquests which were afterwards immensely extended both in India and in the west by his nephews Ghiyássuddín Mahommed ibn Sám and Muízuddín Mahommed Sám (the Shahábuddín Ghúri of the historians), and for a brief period during their rule it was boasted, with no great exaggeration, that the public prayer was read in the name of the Ghúrí from the extremity of India to the borders of Babylonia, and from the Oxus to the Straits of Ormus. After the death of Muízuddín (*alias* Shahábuddín), Mahmúd the son of Ghiyássuddín was proclaimed sovereign (1206) throughout the territories of Ghúr, Ghazni, and Hindustan. But the Indian dominion, from his uncle's death, become entirely independent, and his actual authority was confined to Ghúr, Seistán, and Herat. The whole kingdom fell to pieces before the power of Mahommed Sháh of Khwarazm and his son Jaláluddín (*c.* 1214–1215), a power in its turn to be speedily shattered by the Mongol flood (see GHAZNI).

Besides the thrones of Ghúr and Ghazni, the Shansabaníah family, in the person of Fakhruddin, the eldest of the seven sons of Malik 'Izzuddín, founded a kingdom in the Oxus basin, having its seat at BÁMIÁN (*q. v.*), which endured for two or three generations, till extinguished by the power of Khwarazm (1214). And the great Mussulman empire of Delhi was based on the conquests of Muízuddín the Ghurian, carried out and consolidated by his Turki freedmen, Kutbuddín Aibak and his successors. The princes of Ghúr experienced, about the middle of the 13th century, a revival of power, which endured for 140 years. This later dynasty bore the name of Kurt or Kărt. The first of historical prominence was Malik Shamsuddín Kurt, descended by his mother from the great king Ghiyassuddín Ghúrí, whilst his other grandfather was that prince's favorite minister. In 1245 Shamsuddín held the lordship of Ghúr in some kind of alliance with, or subordination to, the Mongols, who had not yet definitively established themselves in Persia, and in 1248 he received from the Great Khan Mangu an investiture of all the provinces from Merv to the Indus, including by name Sijistan (or Seistán), Cabul, Tírah (adjoining the Khaibar pass), and Afghanistan (a very early occurrence of this name), which he ruled from Herat. He stood well with Hulákú, and for a long time with his son Abaka, but at last incurred the latter's jealousy, and was poisoned when on a visit to the court at Tabriz (1276). His son Ruknuddín Kurt was, however, invested with the government of Khorasan (1278), but after some years, mistrusting his Tartar suzerains, he withdrew into Ghúr, and abode in his strong fortress of Kaissar till his death there in 1305. The family held on through a succession of eight kings in all, sometimes submissive to the Mongol, sometimes aiming at independence, sometimes for a series of prosperous years adding to the strength and splendor of Herat, and sometimes sorely buffeted by the hosts of masterless Tartar brigands that tore Khorasan and Persia in the decline of the dynasties of Hulákú and Chagatai. It is possible that the Kurts might have established a lasting Tajik kingdom at Herat, but in the time of the last of the dynasty, Ghiyassuddín Pir-'Ali, Tartardom, re-organized and re-embodied in the person of Timur, came against Herat, and carried away the king and the treasures of his dynasty (1380). A revolt and massacre of his garrison provoked Timur's vengeance; he put the captive king to death, came against the city a second time, and showed it no mercy (1383). Ghúr has since been as obscure in history as it is in its topography.

The proper capital of the kingdom of Ghúr when its princes were rising to dominion in the 12th century was Firúz-Koh, where a city and fortress were founded by Saifuddin Súri. The true position of Firúz-Koh does not seem to have been determined, but it was probably on or near the upper waters of the Hari-rúd or river of Herat; and it is possible that it may be represented by Shahrak, a place in that valley (about 65° 30′ E. long.), once a populous and flourishing town, which was described to Ferrier, who passed not far from it, as having been anciently the capital of Ghúr. The name of *Firúz-Kohis* has been appropriated to one of the most numerous of the nomad tribes occupying the upper part of the Hari-rúd and part of the Murgháb, but it is doubtful if this has to do with the Ghúr capital, as the name is otherwise explained. Other places claim to have been the old capital. Thus Karrukh, a place visited by Khanikoff in 1858, in a rapid excursion from Herat, and lying on the north side of the valley, is one. But this seems too near Herat (only 30 miles distant). Ferrier, again, describes as the ancient capital a place, which he reached in his journey, called *Zarni*, about 150 miles by road from Herat towards the S. E. The population did not exceed 1200, belonging to the Súrí and Taimúni tribes. The peak of Chalap Dalan, "one of the highest in the world," rose before Zarni in imposing majesty. The mountain, at half its height, has a compass of some 40 miles; the sides are covered with forests and pastures, villages and tents, and also exhibit naturally impregnable positions where successive chiefs have built strongholds. Ferrier, in accompanying the Afghan governor, who lived at Zarni, saw three ancient towns on the skirts of this mountain, all large and fortified, viz., Kala' Kaissar, Kala' Sangi, and Fakhrábád. These are described as only a few *farsakhs*, or hours' march, northeast of Teivereh, which last is in some of our maps. Doubts have indeed been cast on the authenticity of this part of Ferrier's book, chiefly on account of the extreme brevity of the time which he allows. But the professed journal was probably, under the circumstances, only an expansion from memory of the merest jottings; and several things are in favor of authenticity. His notices of the country, slight as they are, correspond notably in the impression conveyed with those of the *Tabakáti-i-Násiri* (see below). *Kaissar*, which he mentions, is a place that has already been referred to as the stronghold of Ruknuddín Kurt. *Zarni*, as roughly located by him, corresponds fairly with what was told Conolly on his journey between Herat and Kandahar, of the position and character of "the old city of

Ghore . . . now a ruinous, ill-inhabited town, the capital of a petty province, governed by one of Shah Kamran's sons, who has his residence there" (*Journey*, vol. ii. p. 61). Zarni is mentioned by Major Leech in connection with Taiwara (Teivereh of Ferrier) and other places in the south of the Ghúr country, but not so as to determine its position. In some other points, moreover, as to names of chiefs, etc., Ferrier's statements agree with Leech's.

See the "Tabakát-i-Násiri," in the *Bibl. Indica*, transl. by Raverty; *Journal Asiatique*, ser. v., tom. xvii.; "Ibn Haukal," in *J. As. Soc. Beng.*, vol. xxii.; Ferrier's *Caravan Journeys;* Hammer's *Ilkhans*, etc. (H. Y.)

GIAMBELLI, or Gianibelli, Federigo, a military engineer, was born at Mantua about the middle of the 16th century. Having had some experience as a military engineer in Italy, he went to Spain to offer his services to Philip II. His proposals were, however, somewhat lukewarmly received, and as he could obtain from the king no immediate employment, he took up his residence at Antwerp, where he soon gained considerable reputation for his knowledge in various departments of science. He is said to have vowed to be revenged for his rebuff at the Spanish court; and when Antwerp was besieged by the duke of Parma in 1584, he put himself in communication with Queen Elizabeth, who having satisfied herself of his abilities, engaged him to aid by his counsels in its defence. His plans for provisioning the town were rejected by the senate, but they agreed to a modification of his scheme for destroying the famous bridge which closed the entrance to the town from the side of the sea, by the conversion of two ships of 60 and 70 tons into infernal machines. One of these exploded, and, besides destroying more than 1000 soldiers, effected a breach in the structure of more than 200 feet in width, by which, but for the hesitation of Admiral Jacobzoon, the town might at once have been relieved. After the surrender of Antwerp Giambelli went to England, where he was engaged for some time in fortifying the river Thames; and when the Spanish Armada was attacked by fire-ships in the Calais roads, the panic which ensued was due to the conviction among the Spaniards that the fire-ships were infernal machines constructed by Giambelli. He is said to have died in London, but the year of his death is unknown. See Motley's *History of the United Netherlands*, vols. i. and ii., and the authorities therein referred in.

GIANNONE, Pietro (1676–1748), the most distinguished historian of whom Naples can boast, and amongst all Italian historians second alone to Fra Paulo Sarpi for the strong and clear light thrown in his works on the growth of the papal power, was born at Ischitella, in the province of Capitanata, on the 7th of May, 1676. Arriving in Naples at the age of eighteen, he devoted himself to the study of law, but his legal pursuits were much surpassed in importance by his literary labors. He devoted twenty years to the composition of his great work, *The Civil History of Naples*, which was ultimately published in 1723. Here, in his account of the rise and progress of the Neapolitan laws and government, he warmly espoused the side of the civil power in its conflicts with the Romish hierarchy. The position thus taken up by him, and the manner in which that position was assumed, gave rise to a life-long conflict between Giannone and the church; and we must know much more accurately than we at present do all the facts concerning his alleged retractation in prison at Turin, before we can withhold from him the palm—as he certainly endured the sufferings—of a confessor and martyr in the cause of what he deemed historical truth. Hooted by the mob of Naples, and excommunicated by the archbishop's court, he was forced to leave Naples and repair to Vienna. Meanwhile the Inquisition had attested after its own fashion the value of his history by putting it on the *Index*. At Vienna the favor of the emperor Charles VI. and of many leading personages at the Austrian court obtained for him a pension and other facilities for the prosecution of his historical studies. Of these the most important result was *Il Triregno, ossia del regno del cielo, della terra, e del papa*. On the transfer of the Neapolitan crown to Charles of Bourbon, Giannone lost his Austrian pension, and was compelled to remove to Venice. There he was at first most favorably received. The post of consulting lawyer to the republic, in which he might have continued the special work of Fra Paulo Sarpi, was offered to him, as well as that of professor of public law in Padua; but he declined both offers. Unhappily there arose a suspicion that his views on maritime law were not favorable to the pretensions of Venice, and, notwithstanding all his efforts to dissipate that suspicion, it was resolved to expel him from the state. On the 23d of September, 1735, he was seized and conveyed to Ferrara. After wandering, under the assumed name of Antonio Rinaldo, for three months through Modena, Milan, and Turin, he at last reached Geneva, where he enjoyed the friendship of the most distinguished citizens, and was on excellent terms with the great publishing firms. But in an evil hour he was induced to visit a Catholic village within the Sardinian territory, where he was kidnapped by the agents of the Sardinian Government, conveyed to the castle of Miolan, and thence successively transferred to Ceva and Turin. In the fortress of Turin he remained immured during the last twelve years of his life, though part of his time was spent in composing a defence of the Sardinian interests as opposed to those of the papal court, and though he was led to sign a retractation of the statements in his history most obnoxious to the Vatican. He died March 7, 1748, in his seventy-second year.

Giannone's style as an Italian writer has been pronounced to be below a severe classical model. But his very ease and freedom, if not classical, have helped to make his volumes more popular than many works of greater classical renown. In England the just appreciation of his labors by Gibbon, and the ample use made of them in the later volumes of *The Decline and Fall*, early secured his rightful place for him in the estimation of English scholars.

A good and complete edition of Giannone's works is still a desideratum. The more important facts of his life have been recorded by the Abbe Fernando Parizini in Italian, and in Latin by Fabroni; whilst a more complete estimate of his literary and political importance may be formed by the perusal of the collected edition of the works written by him in his Turin prison, published in Turin in 1859—under the care of the distinguished statesman Pasquale Stanislao Mancini,[1] late minister of grace and justice, universally recognized as one of the first authorities in Italy on questions relating to the history of his native Naples, and especially to the conflicts between the civil power and the church.

GIANT is the Old English *geant*, derived through French and Latin from Greek *gigas* (*gigant*). The idea conveyed by the word in classic mythology is that of beings more or less manlike, but monstrous in size and strength. Figures like the Titans and the Giants whose birth from Heaven and Earth is sung by Hesiod in the *Theogony*, such as can heap up mountains to scale the sky, and war beside or against the gods, must be treated, with other like monstrous figures of the wonder-tales of the world, as belonging altogether to the realms of mythology. But there also appear in the legends of giants some with historic significance. The ancient and commonly-repeated explanation of the Greek word *γίγας*, as connected with or derived from *γηγενής*, or "earth-born," seems by no means sound as a matter of etymology, but at any rate the idea conveyed by it was familiar to the ancient Greeks, that the giants were earth-born or indigenous races (see Welcker, *Griechische Götterlehre*, vol. i. p. 787). The Bible (the English reader must be cautioned that the word giant has been there used ambiguously, from the Septuagint downwards) touches the present matter in so far as it records the traditions of the Israelites of fighting in Palestine with tall races of the land such as the Anakim (Numb. xiii. 33; Deut. ii. 10, iii. 11; 1 Sam. xvii. 4). When reading in Homer of "the Cyclopes and the wild tribes of the Giants," or of the adventures of Odysseus in the cave of Polyphemus (Homer, *Odyss.*, vii. 206; ix.), we seem to come into view of dim traditions, exaggerated through the mist of ages, of pre-Hellenic barbarians, godless, cannibal, skin-clothed, hurling huge stones in their rude warfare. Giant-legends of this class are common in Europe and Asia, where the big and stupid giants have often every token of uncouth native barbarians, exaggerated into monsters in the legends of the later tribes who dispossessed and slew them.

Besides the conception of giants as special races distinct from mankind, it was a common opinion of the ancients that the human race had itself degenerated, the men of primeval ages having been of so far greater stature and strength as to be in fact gigantic. This, for example, is received by Pliny (*Hist. Nat.*, vii. c. 16), and it becomes a common doctrine of theologians such as Augustine (*De Civitate Dei*, xv. 9), lasting on into times so modern that it may be found in Cruden's *Concordance*. Yet so far as can be judged from actual remains, it does not appear that giants, in the sense of tribes of altogether superhuman stature,

[1] [A Neapolitan jurist (1817–88), fled in 1848 from King Bomba to Turin, parliamentary leader in United Italy, cabinet minister under Rattazzi and Depretis, abolished capital punishment, law professor in University of Rome.—Am. Ed.]

ever existed, or that the men of ancient time were on the whole taller than those now living. It is now usual to apply the word giant to beings not superhuman in their height, but merely the tallest men and women of our nations. In every race of mankind the great mass of individuals do not depart far from a certain mean or average height, while the very tall or very short men become less and less numerous as they depart from the mean standard, till the utmost divergence is reached in a very few giants on the one hand, and a very few dwarfs on the other. At both ends of the scale the body is markedly out of the ordinary proportions; thus a giant's head is smaller and a dwarf's head larger than it would be if an average man had been magnified or diminished. The principle of the distribution of individuals of different sizes in a race or nation has been ably set forth by Quetelet (*Physique Sociale*, vol. ii.; *Anthropométrie*, books iii and iv.). Had this principle been understood formerly, we might have been spared the pains of criticising assertions as to giants 20 feet high, or even more, appearing among mankind. The appearance of an individual man 20 feet high involves the existence of the race he is an extreme member of, whose mean stature would be at least 12 to 14 feet, which is a height no human being has been proved on sufficient evidence to have approached (*Anthropom.*, p. 302). In fact, Quetelet considers the tallest man whose stature has been authentically recorded to have been Frederick the Great's Scottish giant, who was not quite 8 feet 3 inches. Modern statisticians, though admitting that this may not be the extreme limit of human stature, cannot accept the loose conclusion in Buffon (*Hist. Nat.*, ed. Sonnini, vol. iv. p. 134), that there is no doubt of giants having been 10, 12, and perhaps 15 feet high. Confidence is not even to be placed in ancient asserted measurements, as where Pliny gives to one Gabbaras, an Arabian, the stature of 9 feet 9 inches (about 9 feet 5½ inches English), capping this with the mention of Posio and Secundilla, who were half a foot higher. That two persons should be described as both having this same extraordinary measure suggests to the modern critic the notion of a note jotted down on the philosopher's tablets, and never tested afterwards.

Under these circumstances, it is worth while to ask how it is that legend and history so abound in mentions of giants outside all probable dimensions of the human frame. One cause is that, when the story-teller is asked the actual stature of the huge men who figure in his tales, he is not sparing of his inches and feet. What exaggeration can do in this way may be judged from the fact that the Patagonians, whose average height (5 feet 11 inches) is really about that of the Chirnside men in Berwickshire, are described in Pigafetta's *Voyage round the World* as so monstrous that the Spaniards' heads hardly reached their waists. It is reasonable to suppose, with Professor Nilsson (*Primitive Inhabitants of Scandinavia*, chap. vi.), that in the traditions of early Europe tribes of savages may have thus, if really tall, expanded into giants, or, if short, dwindled into dwarfs. Another cause which is clearly proved to have given rise to giant-myths of yet more monstrous type, has been the discovery of great fossil bones, as of mammoth or mastodon, which have from early ages been supposed to be bones of giants, and have given rise to a whole class of giant-myths (see Tylor, *Early History of Mankind*, chap. xi.; *Primitive Culture*, chap. x.). Such anatomical inferences from the leg-bone or tooth of some huge extinct animal are rather creditable to the ingenuity of natives of America, or of barbarians of the Old World; but their late continuance in the midst of European culture shows how recently the principles of comparative anatomy obtained their present hold on the public mind. A tooth weighing 4¾ lb, and a thigh-bone 17 feet long, having been found in New England in 1712 (they were probably mastodon), Dr. Increase Mather thereupon communicated to the Royal Society of London his confirmation from them of the existence of men of prodigious stature in the antediluvian world (see the *Philosophical Transactions*, vol. xxiv. p. 85; D. Wilson, *Prehistoric Man*, vol. i. p. 54). The giants in the streets of Basel and supporting the arms of Lucerne appear to have originated from certain fossil bones found in 1577, examined by the physician Felix Plater, and pronounced to have belonged to a giant some 16 or 19 feet high. These bones have since been referred to a very different geological genus, but within the present century Plater's giant skeleton was accepted as a genuine relic of the giants who once inhabited the earth. See the dissertation of Le Cat, cited in the 5th edition of the *Encyclopædia Britannica* (1817). (E. B. T.)

GIANT'S CAUSEWAY, a promontory of columnar basalt, situated on the coast of Antrim in the north of Ireland. It is divided by whin-dykes into the Little Causeway, the Middle Causeway or "Honeycomb," as it is locally termed, and the Larger or Grand Causeway. The pillars composing it are close-fitting, and for the most part somewhat irregular hexagons, made up of articulated portions varying from a few inches to some feet in depth, and concave or convex at the upper and lower surfaces. In diameter the pillars vary from 15 to 20 inches, and in height some are as much as 20 feet. The Great Causeway is chiefly from 20 to 30, and for a few yards in some places nearly 40 feet in breadth, exclusive of outlying broken pieces of rock. It is highest at its narrowest part. At about half a dozen yards from the cliff, widening and becoming lower, it extends outwards into a parade or platform, which has a slight seaward inclination, but is easily walked on, and for nearly 100 yards is always above water. At the distance of about 150 yards from the cliff it turns a little to the eastward for 20 or 30 yards, and then sinks into the sea. The neighboring cliffs exhibit in many places columns similar to those of the Giant's Causeway, a considerable exposure of them being visible at a distance of about 100 roods in the bay to the eastward. A group of these columns, from their arrangement, have been fancifully named the "Giant's Organ." The most remarkable of the cliffs is the Pleaskin, the upper pillars of which have the appearance of a colonnade, and are 60 feet in height; beneath these is a mass of coarse black amygdaloid, of the same thickness, underlain by a second range of basaltic pillars, from 40 to 50 feet in height. Near the Giant's Causeway are the ruins of the castles of Dunseverick and Dunluce, situated high above the sea on insulated crags, and the swinging bridge of Carrick-a-Rede, spanning a chasm of 80 feet deep, and connecting a rock, which is used as a salmon-fishing station, with the mainland. Fairhead, a promontory composed of columnar greenstone, the highest point on the coast, has an altitude of 550 feet.

See Hamilton, *Letters from the Coast of Antrim;* Dubourdieu, *Statistical Survey of Antrim;* and articles ANTRIM and GEOLOGY.

GIARRE, a town of Sicily, in the province of Catania, between Etna and the sea, with a station on the railway from Messina to Catania, distant from the former 40 miles, and from the latter nearly 19. It is a flourishing place of 6956 inhabitants, according to the census of 1901, or of 13,464 if the suburbs of Macchia, St. Giovanni, and St. Alfio are included; but it has little to show except a handsome modern church, and is mainly of interest as the point from which tourists start to visit the remains of the gigantic chestnut tree of the hundred horses (*di cento cavalli*).

GIAVENO, a market-town of Italy, in the province of Turin, and circondario of Susa, about 16 miles W. of Turin, at the foot of the Cottian Alps, and on the left bank of the Sangone, a head water of the Po. It possesses a fine old castle, an almshouse, a gymnasium, a children's asylum, several well-built churches, and an ancient abbatial residence; and its inhabitants manufacture paper and silk, and maintain a trade in wine and timber. Population of the town in 1901, 7222, and of the commune 10,795.

GIB, ADAM (1714–1788), the leader of the Antiburgher section of the Scottish Secession Church, was born April 14, 1714, in the parish of Muckhart, Perthshire, and, on the completion of his literary and theological studies at Edinburgh and Perth, was licensed as a preacher in 1740. In the following year he was ordained minister of the large Secession congregation of Bristo, Edinburgh, being the first in the city inducted into such a charge; and there his powerful intellect and his intensity of character soon secured for him a position of considerable prominence. In 1742 he caused some stir by the publication of an invective entitled *A warning against countenancing the ministrations of Mr. George Whitefield;* and in 1745 he was almost the only minister of Edinburgh who continued to preach, and to preach against rebellion, while the troops of Charles Edward were in occupation of the town. When in 1747 "the Associate Synod," by a narrow majority, decided not to give full immediate effect to a judgment which had been passed in the previous year against the lawfulness of the "Burgess

Oath,"[1] Gib led the protesting minority, who forthwith separated from their brethren and formed the Antiburgher Synod. It was chiefly under his influence that it was agreed by this ecclesiastical body at subsequent meetings to summon to the bar their "Burgher" brethren, and finally to depose and excommunicate them for contumacy. In 1765 he made a vigorous and able reply to the General Assembly of the Church of Scotland, which had stigmatized the Secession as "threatening the peace of the country;" and this apology was further developed in his *Display of the Secession Testimony*, published in 1774. From 1753 (when after protracted litigation he was compelled to leave the Bristo church) till within a short period of his death, which took place June 18, 1788, he preached regularly in Nicolson Street church, which is said to have been filled every Sunday with an audience of 2000 persons. Besides other publications, he wrote a volume of *Sacred Contemplations* (1786), to which was appended an "Essay on Liberty and Necessity" in reply to Lord Kames.

GIBBON. See APE, vol. ii. p. 132.

GIBBON, EDWARD (1737–1794), one of the most celebrated historians of any age or country, was also his own historian. He has left us one of the most piquant autobiographies ever written. In the following sketch the chief incidents of his life will be condensed from that authentic source. For more than facts, even for the setting of these, it is needless to say that it would be unwise to trust to any man's autobiography—though Gibbon's is as frank as most. There are points on which vanity will say too much, and perhaps others on which modesty will say too little.

Gibbon was descended, he tells us, from a Kentish family of considerable antiquity; among his remoter ancestors he reckons the Lord High Treasurer Fiennes, Lord Say and Sele, whom Shakespeare has immortalized in his *Henry VI.* His grandfather was a man of ability, an enterprising merchant of London, one of the commissioners of customs under the Tory ministry during the last four years of Queen Anne, and, in the judgment of Lord Bolingbroke, as deeply versed in the "commerce and finances of England" as any man of his time. He was not always wise, however, either for himself or his country; for he became deeply involved in the South Sea Scheme, in the disastrous collapse of which (1720) he lost the ample wealth he had amassed. As a director of the company, moreover, he was suspected of fraudulent complicity, taken into custody, and heavily fined; but £10,000 was allowed him out of the wreck of his estate, and with this his skill and enterprise soon constructed a second fortune. He died at Putney in 1736, leaving the bulk of his property to his two daughters—nearly disinheriting his only son, the father of the historian, for having married against his wishes. This son (by name Edward) was educated at Westminster[2] and Cambridge, but never took a degree, travelled, became member of Parliament, first for Petersfield (1734), then for Southampton (1741), joined the party against Sir Robert Walpole, and (as his son confesses, not much to his father's honor) was animated in so doing by "private revenge" against the supposed "oppressor" of his family in the South Sea affair. If so, revenge, as usual, was blind; for Walpole had sought rather to moderate than to inflame public feeling against the projectors.

The historian was born at Putney, Surrey, April 27 (Old Style), 1737. His mother, Judith Porten, was the daughter of a London merchant. He was the eldest of a family of six sons and a daughter, and the only one who survived childhood; his own life in youth hung by so mere a thread as to be again and again despaired of. His mother, between domestic cares and constant infirmities (which, however, did not prevent an occasional plunge into fashionable dissipation in compliance with her husband's wishes), did but little for him. The "true mother of his mind as well as of his health" was a maiden aunt—Catherine Porten by name—with respect to whom he expresses himself in language of the most grateful remembrance. "Many anxious and solitary days," says Gibbon, "did she consume with patient trial of every mode of relief and amusement. Many wakeful nights did she sit by my bedside in trembling expectation that each hour would be my last." As circumstances allowed, she appears to have taught him reading, writing, and arithmetic—acquisitions made with so little of remembered pain that "were not the error corrected by analogy," he says, "I should be tempted to conceive them as innate." At seven he was committed for eighteen months to the care of a private tutor, John Kirkby by name, and the author, among other things, of a "philosophical fiction," entitled the *Life of Automathes*. Of Kirkby, from whom he learned the rudiments of English and Latin grammar, he speaks gratefully, and doubtless truly, so far as he could trust the impressions of childhood. With reference to *Automathes* he is much more reserved in his praise, denying alike its originality, its depth, and its elegance; but, he adds, "the book is not devoid of entertainment or instruction."

In his ninth year (1746), during a "lucid interval of comparative health," he was sent to a school at Kingston-upon-Thames; but his former infirmities soon returned, and his progress, by his own confession, was slow and unsatisfactory. "My timid reserve was astonished by the crowd and tumult of the school; the want of strength and activity disqualified me for the sports of the play-field. . . . By the common methods of discipline, at the expense of many tears and some blood, I purchased the knowledge of the Latin syntax," but manifestly, in his own opinion, the *Arabian Nights*, Pope's *Homer*, and Dryden's *Virgil*, eagerly read, had at this period exercised a much more powerful influence on his intellectual development than Phædrus and Cornelius Nepos, "painfully construed and darkly understood."

In December, 1747, his mother died, and he was taken home. After a short time his father removed to the "rustic solitude" of Buriton (Hants), but young Gibbon lived chiefly at the house of his maternal grandfather, at Putney, where, under the care of his devoted aunt, he developed, he tells us, that passionate love of reading "which he would not exchange for all the treasures of India," and where his mind received its most decided stimulus. Of 1748 he says, "This year, the twelfth of my age, I shall note as the most propitious to the growth of my intellectual stature." After detailing the circumstances which unlocked for him the door of his grandfather's "tolerable library," he says, "I turned over many English pages of poetry and romance, of history and travels. Where a title attracted my eye, without fear or awe I snatched the volume from the shelf." In 1749, in his twelfth year, he was sent to Westminster, still residing, however, with his aunt, who, rendered destitute by her father's bankruptcy, but unwilling to live a life of dependence, had opened a boarding-house for Westminster school. Here in the course of two years (1749–50), interrupted by danger and debility, he "painfully climbed into the third form;" but it was left to his riper age to "acquire the beauties of the Latin and the rudiments of the Greek tongue." The continual attacks of sickness which had retarded his progress induced his aunt, by medical advice, to take him to Bath; but the mineral waters had no effect. He then resided for a time in the house of a physician at Winchester; the physician did as little as the mineral waters; and, after a further trial of Bath, he once more returned to Putney, and made a last futile attempt to study at Westminster. Finally, it was concluded that he would never be able to encounter the discipline of a school; and casual instructors, at various times and places, were provided for him. Meanwhile his indiscriminate appetite for reading had begun to fix itself more and more decidedly upon history; and the list of historical works devoured by him during this period of chronic ill-health is simply astonishing. It included, besides Hearne's *Ductor Historicus* and the successive volumes of the *Universal History*, which was then in course of publication, Littlebury's *Herodotus*, Spelman's *Xenophon*, Gordon's *Tacitus*, an anonymous translation of Procopius; "many crude lumps of Speed, Rapin, Mezeray, Davila, Machiavel, Father Paul, Bower, etc., were hastily gulped. I devoured them like so many novels; and I swallowed with the same voracious appetite the descriptions of India and China, of Mexico and Peru." His first introduction to the historic scenes the study of which afterwards formed the passion of his life took place in 1751, when, while along with his father visiting a friend in Wiltshire, he discovered in the library "a common book, the continuation of Echard's *Roman History*." "To me the reigns of the successors of Con-

[1] This was an oath imposed upon all burgesses of Edinburgh, Glasgow, Perth, and some other towns, by which they "professed and allowed the true religion presently professed within this realm, and authorized by the laws thereof." The question was whether these words implied an approbation of the Established Church, with all its "corruptions."

[2] The celebrated William Law had been for some time the private tutor of this Edward Gibbon, who is supposed to have been the original of the rather clever sketch of "Flatus" in the *Serious Call*.

stantine were absolutely new; and I was immersed in the passage of the Goths over the Danube, when the summons of the dinner bell reluctantly dragged me from my intellectual feast." Soon afterwards his fancy kindled with the first glimpses into Oriental history, the wild "barbaric" charm of which he never ceased to feel. Ockley's book on the Saracens "first opened his eyes" to the striking career of Mahomet and his hordes; and with his characteristic ardor of literary research, after exhausting all that could be learned in English of the Arabs and Persians, the Tartars and Turks, he forthwith plunged into the French of D'Herbelot, and the Latin of Pocock's version of Abulfaragius, sometimes understanding them, but oftener only guessing their meaning. He soon learned to call to his aid the subsidiary sciences of geography and chronology, and before he was quite capable of reading them had already attempted to weigh in his childish balance the competing systems of Scaliger and Petavius, of Marsham and Newton. At this early period he seems already to have adopted in some degree the plan of study he followed in after life, and recommended in his *Essai sur l'Étude*—that is, of letting his subject rather than his author determine his course, of suspending the perusal of a book to reflect, and to compare the statements with those of other authors,—so that he often read portions of many volumes while mastering one.

Towards his sixteenth year he tells us "nature displayed in his favor her mysterious energies," and all his infirmities suddenly vanished. Thenceforward, while never possessing or abusing the insolence of health, he could say "few persons have been more exempt from real or imaginary ills." His unexpected recovery revived his father's hopes for his education, hitherto so much neglected if judged by ordinary standards; and accordingly in January, 1752, he was placed at Esher, Surrey, under the care of Dr. Francis, the well known translator of Horace. But Gibbon's friends in a few weeks discovered that the new tutor preferred the pleasures of London to the instruction of his pupils, and in this perplexity decided to send him prematurely to Oxford, where he was matriculated as a gentleman commoner of Magdalen College, 3d April, 1752. According to his own testimony, he arrived at the university "with a stock of information which might have puzzled a doctor, and a degree of ignorance of which a school-boy might be ashamed." And indeed his huge wallet of scraps stood him in little stead at the trim banquets to which he was invited at Oxford, while the wandering habits by which he had filled it absolutely unfitted him to be a guest. He was not well grounded in any of the elementary branches, which are essential to university studies, and to all success in their prosecution. It was natural therefore that he should dislike the university, and as natural that the university should dislike him. Many of his complaints of the system were certainly just; but it may be doubted whether any university system would have been profitable to him, considering his antecedents. He complains especially of his tutors, and in one case with abundant reason; but, by his own confession, they might have recriminated with justice, for he indulged in gay society, and kept late hours. His observations, however, on the defects of the English university system, some of which have only very recently been removed, are acute and well worth pondering, however little relevant to his own case. He remained at Magdalen about fourteen months. "To the university of Oxford," he says, "I acknowledge no obligation; and she will as cheerfully renounce me for a son as I am willing to disclaim her for a mother I spent fourteen months at Magdalen College, they proved the fourteen months the most idle and unprofitable of my whole life."

But thus "idle" though he may have been as a "student," he already meditated authorship. In the first long vacation—during which he, doubtless with some sarcasm, says that "his taste for books began to revive"—he contemplated a treatise on the age of Sesostris, in which (and it was characteristic) his chief object was to investigate not so much the events as the probable epoch of the reign of that semi-mythical monarch, whom he was inclined to regard as having been contemporary with Solomon. "Unprovided with original learning, unformed in the habits of thinking, unskilled in the arts of composition, I resolved to write a book;" but the discovery of his own weakness, he adds, was the first symptom of taste. On his first return to Oxford the work was "wisely relinquished," and never afterwards resumed. The most memorable incident, however, in Gibbon's stay at Oxford was his temporary conversion to the doctrines of the church of Rome. The bold criticism of Middleton's recently (1749) published, *Free Enquiry into the Miraculous Powers which are supposed to have subsisted in the Christian Church*, appears to have given the first shock to his Protestantism, not indeed by destroying his previous belief that the gift of miraculous powers had continued to subsist in the church during the first four or five centuries of Christianity, but by convincing him that within the same period most of the leading doctrines of popery had been already introduced both in theory and in practice. At this stage he was introduced by a friend (Mr. Molesworth) to Bossuet's *Variations of Protestantism*, and *Exposition of Catholic Doctrine* (see Gibbon, *Decline and Fall*, c. xv., note 79). "These works," says he, "achieved my conversion, and I surely fell by a noble hand." In bringing about this "fall," however, Parsons the Jesuit appears to have had a considerable share; at least Lord Sheffield has recorded that on the only occasion on which Gibbon talked with him on the subject he imputed the change in his religious views principally to that vigorous writer, who, in his opinion, had urged all the best arguments in favor of Roman Catholicism. But be this as it may, he had no sooner adopted his new creed than he resolved to profess it; "a momentary glow of enthusiasm" had raised him above all temporal considerations, and accordingly, on June 8, 1753, he records that having "privately abjured the heresies" of his childhood before a Catholic priest of the name of Baker, a Jesuit, in London, he announced the same to his father in an elaborate controversial epistle which his spiritual adviser much approved, and which he himself afterwards described to Lord Sheffield as having been "written with all the pomp, the dignity, and self-satisfaction of a martyr."

The elder Gibbon heard with indignant surprise of this act of juvenile apostacy, and, indiscreetly giving vent to his wrath, precipitated the expulsion of his son from Oxford, a punishment which the culprit, in after years at least, found no cause to deplore. In his *Memoirs* he speaks of the results of his "childish revolt against the religion of his country" with undisguised self-gratulation. It had delivered him for ever from the "port and prejudice" of the university, and led him into the bright paths of philosophic freedom. That his conversion was sincere at the time, that it marked a real if but a transitory phase of genuine religious conviction, we have no reason to doubt, notwithstanding the scepticism he has himself expressed. "To my present feelings it seems incredible that I should ever believe that I believed in transubstantiation," he indeed declares; but his incredulous astonishment is not unmixed with undoubting pride. "I could not blush that my tender mind was entangled in the sophistry which had reduced the acute and manly understandings of a Chillingworth or a Bayle." Nor is the sincerity of the Catholicism he professed in these boyish days in any way discredited by the fact of his subsequent lack of religion. Indeed, as one of the acutest and most sympathetic of his critics has remarked, the deep and settled grudge he has betrayed towards every form of Christian belief, in all the writings of his maturity, may be taken as evidence that he had at one time experienced in his own person at least some of the painful workings of a positive faith.

But little time was lost by the elder Gibbon in the formation of a new plan of education for his son, and in devising some method which if possible might effect the cure of his "spiritual malady." The result of deliberation, aided by the advice and experience of Lord Eliot, was that it was almost immediately decided to fix Gibbon for some years abroad under the roof of M. Pavilliard, a Calvinist minister at Lausanne. In as far as regards the instructor and guide thus selected, a more fortunate choice could scarcely have been made. From the testimony of his pupil, and the still more conclusive evidence of his own correspondence with the father, Pavilliard seems to have been a man of singular good sense, temper, and tact. At the outset, indeed, there was one considerable obstacle to the free intercourse of tutor and pupil: M. Pavilliard appears to have known little of English, and young Gibbon knew practically nothing of French. But this difficulty was soon removed by the pupil's diligence; the very exigencies of his situation were of service to him in calling forth all his powers, and he studied the language with such success that at the close of his five years' exile, he declares that he "spontaneously thought"

in French rather than in English, and that it had become more familiar to "ear, tongue, and pen." It is well known that in after years he had doubts whether he should not compose his great work in French; and it is certain that his familiarity with that language, in spite of considerable efforts to counteract its effects, tinged his style to the last.

Under the judicious regulations of his new tutor a methodical course of reading was marked out, and most ardently prosecuted; the pupil's progress was proportionately rapid. With the systematic study of the Latin, and to a slight extent also of the Greek classics, he conjoined that of logic in the prolix system of Crousaz; and he further invigorated his reasoning powers, as well as enlarged his knowledge of metaphysics and jurisprudence, by the perusal of Locke, Grotius, and Montesquieu. He also read largely, though somewhat indiscriminately, in French literature, and appears to have been particularly struck with Pascal's *Provincial Letters*, which he tells us he reperused almost every year of his subsequent life with new pleasure, and which he particularly mentions as having been, along with Bleterie's *Life of Julian* and Giannone's *History of Naples*, a book which probably contributed in a special sense to form the historian of the Roman empire. The comprehensive scheme of study included mathematics also, in which he advanced as far as the conic sections in the treatise of L'Hôpital. He assures us that his tutor did not complain of any inaptitude on the pupil's part, and that the pupil was as happily unconscious of any on his own; but here he broke off. He adds, what is not quite clear from one who so frankly acknowledges his limited acquaintance with the science, that he had reason to congratulate himself that he knew no more. "As soon," he says, "as I understood the principles, I relinquished for ever the pursuit of the mathematics; nor can I lament that I desisted, before my mind was hardened by the habit of rigid demonstration, so destructive of the finer feelings of moral evidence, which must, however, determine the actions and opinions of our lives."

Under the new influences which were brought to bear on him, he in less than two years resumed his Protestantism. "He is willing," he says, to allow M. Pavilliard a "handsome share in his reconversion," though he maintains, and no doubt rightly, that it was principally due "to his own solitary reflections." He particularly congratulated himself on having discovered the "philosophical argument" against transubstantiation, "that the text of Scripture which seems to inculcate the real presence is attested only by a single sense—our sight, while the real presence itself is disproved by three of our senses—the sight, the touch, and the taste. Before a similar mode of reasoning, all the other distinctive articles of the Romish creed "disappeared like a dream;" and "after a full conviction," on Christmas day, 1754, he received the sacrament in the church of Lausanne. Although, however, he adds that at this point he suspended his religious inquiries, "acquiescing with implicit belief in the tenets and mysteries which are adopted by the general consent of Catholics and Protestants," his readers will probably do him no great injustice if they assume that even then it was rather to the negations than to the affirmations of Protestantism that he most heartily assented.

With all his devotion to study at Lausanne[1] (he read ten or twelve hours a day), he still found some time for the acquisition of some of the lighter accomplishments, such as riding, dancing, drawing, and also for mingling in such society as the place had to offer. In September, 1755, he writes to his aunt, "I find a great many agreeable people here, see them sometimes, and can say upon the whole, without vanity, that, though I am the Englishman here who spends the least money, I am he who is most generally liked." Thus his "studious and sedentary life" passed pleasantly enough, interrupted only at rare intervals by boyish excursions of a day or a week in the neighborhood, and by at least one memorable tour of Switzerland, by Basel, Zürich, Lucerne, and Bern, made along with Pavilliard in the autumn of 1755. The last eighteen months of this residence abroad saw the infusion of two new elements—one of them at least of considerable importance—into his life. In 1757 Voltaire came to reside at Lausanne; and although he took but little notice of the young Englishman of twenty, who eagerly sought and easily obtained an introduction, the establishment of the theatre at Monrepos, where the brilliant versifier himself declaimed before select audiences his own productions on the stage, had no small influence in fortifying Gibbon's taste for the French theatre, and in at the same time abating that "idolatry for the gigantic genius of Shakespeare which is inculcated from our infancy as the first duty of an Englishman." In the same year—apparently about June—he saw for the first time, and forthwith loved, the beautiful, intelligent, and accomplished Mademoiselle Susan Curchod, daughter of the pasteur of Crassier. That the passion which she inspired in him was tender, pure, and fitted to raise to a higher level a nature which in some respects was much in need of such elevation will be doubted by none but the hopelessly cynical; and probably there are few readers who can peruse the paragraph in which Gibbon "approaches the delicate subject of his early love" without discerning in it a pathos much deeper than that of which the writer was himself aware. During the remainder of his residence at Lausanne he had good reason to "indulge his dream of felicity;" but on his return to England, "I soon discovered that my father would not hear of this strange alliance, and that without his consent I was myself destitute and helpless. After a painful struggle I yielded to my fate; I sighed as a lover, I obeyed as a son; my wound was insensibly healed by time, absence, and the habits of a new life."[2]

In 1758 he returned with mingled joy and regret to England, and was kindly received at home. But he found a stepmother there; and this apparition on his father's hearth at first rather appalled him. The cordial and gentle manners of Mrs. Gibbon, however, and her unremitting care for his happiness, won him from his first prejudices, and gave her a permanent place in his esteem and affection. He seems to have been much indulged, and to have led a very pleasant life of it; he pleased himself in moderate excursions, frequented the theatre, mingled, though not very often, in society; was sometimes a little extravagant, and sometimes a little dissipated, but never lost the benefits of his Lausanne exile; and easily settled into a sober, discreet, calculating Epicurean philosopher, who sought the *summum bonum* of man in temperate, regulated, and elevated pleasure. The first two years after his return to England he spent principally at his father's country seat at Buriton, in Hampshire, only nine months being given to the metropolis. He has left an amusing account of his employments in the country, where his love of study was at once inflamed by a large and unwonted command of books and checked by the necessary interruptions of his otherwise happy domestic life. After breakfast "he was expected," he says, to spend an hour with Mrs. Gibbon; after tea his father claimed his conversation; in the midst of an interesting work he was often called down to entertain idle visitors; and, worst of all, he was periodically compelled to return the well-meant compliments. He mentions that he dreaded the "recurrence of the full moon," which was the period generally selected for the more convenient accomplishment of such formidable excursions.

His father's library, though large in comparison with that he commanded at Lausanne, contained, he says, "much trash;" but a gradual process of reconstruction transformed it at length into that "numerous and select" library which was "the foundation of his works, and the best comfort of his life both at home and abroad." No sooner had he returned home than he began the work of accumulation, and records that, on the receipt of his first quarter's allowance, a large share was appropriated to his literary wants. "He

[1] The *Journal* for 1755 records that during that year, besides writing and translating a great deal in Latin and French, he had read, amongst other works, Cicero's *Epistolæ ad Familiares*, his *Brutus*, all his *Orations*, his dialogues *De Amicitia* and *De Senectute*, Terence (twice), and Pliny's *Epistles*. In January, 1756, he says:—"I determined to read over the Latin authors in order, and read this year Virgil, Sallust, Livy, Velleius Paterculus, Valerius Maximus, Tacitus, Suetonius, Quintus Curtius, Justin, Florus, Plautus, Terence, and Lucretius. I also read and meditated Locke *Upon the Understanding*." Again in January, 1757, he writes:—"I began to study algebra under M. de Traytorrens, went through the elements of algebra and geometry, and the three first books of the Marquis de l'Hôpital's *Conic Sections*. I also read Tibullus, Catullus, Propertius, Horace (with Dacier's and Torrentius's notes), Virgil, Ovid's *Epistles*, with Meziriac's commentary, the *Ars Amandi*, and the *Elegies;* likewise the *Augustus* and *Tiberius* of Suetonius, and a Latin translation of Dion Cassius from the death of Julius Cæsar to the death of Augustus. I also continued my correspondence, begun last year, with M. Allamand of Bex, and the Professor Breitinger of Zürich, and opened a new one with the Professor Gesner of Göttingen. *N.B.*—Last year and this I read St. John's Gospel, with part of Xenophon's *Cyropædia*, the *Iliad*, and Herodotus; but, upon the whole, I rather neglected my Greek."

[2] The affair, however, was not finally broken off till 1763. Mdlle. Curchod soon afterwards became the wife of Necker, the famous financier; and Gibbon and the Neckers frequently afterwards met on terms of mutual friendship and esteem.

could never forget," he declares, "the joy with which he exchanged a bank note of twenty pounds for the twenty volumes of the *Memoirs* of the Academy of Inscriptions," an academy which has been well characterized (by Sainte-Beuve) as Gibbon's intellectual fatherland. It may not be uninteresting here to note the principles which guided him both now and afterwards in his literary purchases. "I am not conscious," says he. "of having ever bought a book from a motive of ostentation; every volume, before it was deposited on the shelf, was either read or sufficiently examined;" he also mentions that he soon adopted the tolerating maxim of the elder Pliny, that no book is ever so bad as to be absolutely good for nothing.

In London he seems to have seen but little select society, —partly from his father's taste, "which had always preferred the highest and the lowest company," and partly from his own reserve and timidity, increased by his foreign education, which had made English habits unfamiliar, and the very language in some degree strange. And thus he was led to draw that interesting picture of the literary recluse among the crowds of London: "While coaches were rattling through Bond Street, I have passed many a solitary evening in my lodging with my books. My studies were sometimes interrupted with a sigh, which I breathed towards Lausanne; and on the approach of spring I withdrew without reluctance from the noisy and extensive scene of crowds without company, and dissipation without pleasure." He renewed former acquaintance, however, with the "poet" Mallet, and through him gained access to Lady Hervey's circle, where a congenial admiration, not to say affectation, of French manners and literature made him a welcome guest. It ought to be added that in each of the twenty-five years of his subsequent acquaintance with London "the prospect gradually brightened," and his social as well as his intellectual qualities secured him a wide circle of friends. In one respect Mallet gave him good counsel in those early days. He advised him to addict himself to an assiduous study of the more idiomatic English writers, such as Swift and Addison,—with a view to unlearn his foreign idiom, and recover his half-forgotten vernacular, —a task, however, which he never perfectly accomplished. Much as he admired these writers, Hume and Robertson were still greater favorites, as well from their subject as for their style. Of his admiration of Hume's style, of its nameless grace of simple elegance, he has left us a strong expression, when he tells us that it often compelled him to close the historian's volumes with a mixed sensation of delight and despair.

In 1761 Gibbon, at the age of twenty-four, after many delays, and with many flutterings of hope and fear, gave to the world, in French, his maiden publication, an *Essai sur l'Étude de la Littérature*, which he had composed two years before. It was published partly in compliance with his father's wishes, who thought that the proof of some literary talent might introduce him favorably to public notice, and secure the recommendation of his friends for some appointment in connection with the mission of the English plenipotentiaries to the congress at Augsburg which was at that time in contemplation. But in yielding to paternal authority, Gibbon frankly owns that he "complied, like a pious son, with the wish of his own heart."

The subject of this youthful effort was suggested, its author says, by a refinement of vanity—"the desire of justifying and praising the object of a favorite pursuit," namely, the study of ancient literature. Partly owing to its being written in French, partly to its character, the *Essai* excited more attention abroad than at home. Gibbon has criticised it with the utmost frankness, not to say severity; but, after every abatement, it is unquestionably a surprising effort for a mind so young, and contains many thoughts which would not have disgraced a thinker or a scholar of much maturer age. His account of its first reception and subsequent fortunes in England deserves to be cited as a curious piece of literary history. "In England," he says, "it was received with cold indifference, little read, and speedily forgotten. A small impression was slowly dispersed; the bookseller murmured, and the author (had his feelings been more exquisite) might have wept over the blunders and baldness of the English translation. The publication of my history fifteen years afterwards revived the memory of my first performance, and the essay was eagerly sought in the shops. But I refused the permission which Becket solicited of reprinting it; the public curiosity was imperfectly satisfied by a pirated copy of the booksellers of Dublin; and when a copy of the original edition has been discovered in a sale, the primitive value of half-a-crown has risen to the fanciful price of a guinea or thirty shillings."[1]

Some time before the publication of the essay, Gibbon had entered a new and, one might suppose, a very uncongenial scene of life. In an hour of patriotic ardor he became (June 12, 1759) a captain in the Hampshire militia, and for more than two years (May 10, 1760, to December 23, 1762) led a wandering life of "military servitude." Hampshire, Kent, Wiltshire, and Dorsetshire formed the successive theatres of what he calls his "bloodless and inglorious campaigns." He complains of the busy idleness in which his time was spent; but, considering the circumstances, so adverse to study, one is rather surprised that the military student should have done so much, than that he did so little; and never probably before were so many hours of literary study spent in a tent. In estimating the comparative advantages and disadvantages of this wearisome period of his life, he has summed up with the impartiality of a philosopher and the sagacity of a man of the world. Irksome as were his employments, grievous as was the waste of time, uncongenial as were his companions, solid benefits were to be set off against these things: his health became robust, his knowledge of the world was enlarged, he wore off some of his foreign idiom, got rid of much of his reserve; he adds—and perhaps in his estimate it was the benefit to be most prized of all—"the discipline and evolutions of a modern battalion gave me a clearer notion of the phalanx and the legion, and the captain of the Hampshire grenadiers (the reader may smile) has not been useless to the historian of the Roman empire."

It was during this period that he read Homer and Longinus, having for the first time acquired some real mastery of Greek; and after the publication of the *Essai*, his mind was full of projects for a new literary effort. The Italian expedition of Charles VIII. of France, the crusade of Richard I., the wars of the barons, the lives and comparisons of Henry V. and the emperor Titus, the history of the Black Prince, the life of Sir Philip Sydney, that of Montrose, and finally that of Sir W. Raleigh, were all of them seriously contemplated and successively rejected. By their number they show how strong was the impulse to literature, and, by their character, how determined the bent of his mind in the direction of history; while their variety makes it manifest also that he had then at least no special purpose to serve, no preconceived theory to support, no particular prejudice or belief to overthrow.

The militia was disbanded in 1762, and Gibbon joyfully shook off his bonds; but his literary projects were still to be postponed. Following his own wishes, though with his father's consent, he had early in 1760 projected a Continental tour as the completion "of an English gentleman's education." This had been interrupted by the episode of the militia; now, however, he resumed his purpose, and left England in January, 1763. Two years were "loosely defined as the term of his absence," which he exceeded by half a year—returning June, 1765. He first visited Paris, where he saw a good deal of D'Alembert, Diderot, Barthélemy, Raynal, Helvétius, Baron d'Holbach, and others of that circle, and was often a welcome guest in the saloons of Madame Geoffrin and Madame du Deffand.[2] Voltaire was at Geneva, Rousseau at Montmorency, and Buffon he neglected to visit; but so congenial did he find the society for which his education had so well prepared him, and into which some literary reputation had already preceded him, that he declared, "Had I been rich and independent, I should have prolonged, and perhaps have fixed my residence at Paris."

From France he proceeded to Switzerland, and spent nearly a year at Lausanne, where many old friendships and

[1] The *Essai*, in a good English translation, now appears in the *Miscellaneous Works*. Villemain finds in it "peu de vues, nulle originalité surtout, mais une grande passion littéraire, l'amour des recherches savantes et du beau langage." Sainte-Beuve's criticism is almost identical with Gibbon's own; but though he finds that "La lecture en est assez difficile et parfois obscure, la liaison des idées échappe souvent par trop de concision et par le désir qu'a eu le jeune auteur d'y faire entrer, d'y condenser la plupart de ses notes," he adds, "Il y a, chemin faisant, des vues neuves et qui sentent l'historien."

[2] Her letters to Walpole about Gibbon contain some interesting remarks by this "aveugle clairvoyante," as Voltaire calls her; but they belong to a later period (1777).

studies were resumed, and new ones begun. His reading was largely designed to enable him fully to profit by the long contemplated Italian tour which began in April, 1764, and lasted somewhat more than a year. He has recorded one or two interesting notes on Turin, Genoa, Florence, and other towns at which halt was made on his route; but Rome was the great object of his pilgrimage, and the words in which he has alluded to the feelings with which he approached it are such as cannot be omitted from any sketch of Gibbon, however brief: "My temper is not very susceptible of enthusiasm, and the enthusiasm which I do not feel I have ever scorned to affect. But at the distance of twenty-five years, I can neither forget nor express the strong emotions which agitated my mind as I first approached and entered the Eternal City. After a sleepless night I trod with a lofty step the ruins of the forum; each memorable spot where Romulus stood, or Tully spoke, or Cæsar fell, was at once present to my eye; and several days of intoxication were lost or enjoyed before I could descend to a cool and minute investigation." Here at last his long yearning for some great theme worthy of his historic genius was gratified. The first conception of the *Decline and Fall* arose as he lingered one evening amidst the vestiges of ancient glory. "It was at Rome, on the 15th of October, 1764, as I sat musing amidst the ruins of the Capitol, while the barefooted friars were singing vespers in the temple of Jupiter, that the idea of writing the decline and fall of the city first started to my mind."

The five years and a half which intervened between his return from this tour, in June, 1765, and the death of his father, in November, 1770, seem to have formed the portion of his life which "he passed with the least enjoyment, and remembered with the least satisfaction." He attended every spring the meetings of the militia at Southampton, and rose successively to the rank of major and lieutenant-colonel commandant; but was each year "more disgusted with the inn, the wine, the company, and the tiresome repetition of annual attendance and daily exercise." From his own account, however, it appears that other and deeper causes produced this discontent. Sincerely attached to his home, he yet felt the anomaly of his position. At thirty, still a dependant, without a settled occupation, without a definite social status, he often regretted that he had not "embraced the lucrative pursuits of the law or of trade, the chances of civil office or India adventure, or even the fat slumbers of the church." From the emoluments of a profession he "might have derived an ample fortune, or a competent income, instead of being stinted to the same narrow allowance, to be increased only by an event which he sincerely deprecated." Doubtless the secret fire of a consuming, but as yet ungratified, literary ambition also troubled his repose. He was still contemplating "at an awful distance" *The Decline and Fall*, and meantime revolved some other subjects, that seemed more immediately practicable. Hesitating for some time between the revolutions of Florence and those of Switzerland, he consulted M. Deyverdun, a young Swiss with whom he had formed a close and intimate friendship during his first residence at Lausanne, and finally decided in favor of the land which was his "friend's by birth" and "his own by adoption." He executed the first book in French; it was read (in 1767) as an anonymous production, before a literary society of foreigners in London, and condemned. Gibbon sat and listened unobserved to their strictures. It never got beyond that rehearsal; Hume, indeed, approved of the performance, only deprecating as unwise the author's preference for French; but Gibbon sided with the majority.

In 1767 also he joined with M. Deyverdun in starting a literary journal under the title of *Mémoires Littéraires de la Grande Bretagne*. But its circulation was limited, and only the second volume had appeared (1768) when Deyverdun went abroad. The materials already collected for a third volume were suppressed. It is interesting, however, to know that in the first volume is a review by Gibbon of Lord Lyttelton's *History of Henry II.*, and that the second volume contains a contribution by Hume on Walpole's *Historic Doubts*.

The next appearance of the historian made a deeper impression. It was the first distinct print of the lion's foot. "Ex ungue leonem" might have been justly said, for he attacked, and attacked successfully, the redoubtable Warburton. Of the many paradoxes in the *Divine Legation*, few are more extravagant than the theory that Virgil, in the sixth book of his *Æneid*, intended to allegorize, in the visit of his hero and the Sibyl to the shades, the initiation of Æneas, as a lawgiver, into the Eleusinian mysteries. This theory Gibbon completely exploded in his *Critical Observations* (1770),—no very difficult task, indeed, but achieved in a style, and with a profusion of learning, which called forth the warmest commendations both at home and abroad. Warburton never replied; and few will believe that he would not, if he had not thought silence more discreet. Gibbon, however, regrets that the style of his pamphlet was too acrimonious; and this regret, considering his antagonist's slight claims to forbearance, is creditable to him. "I cannot forgive myself the contemptuous treatment of a man who, with all his faults, was entitled to my esteem; and I can less forgive, in a personal attack, the cowardly concealment of my name and character."

Soon after his "release from the fruitless task of the Swiss revolution" in 1768, he had gradually advanced from the wish to the hope, from the hope to the design, from the design to the execution of his great historical work. His preparations were indeed vast. The classics, "as low as Tacitus, Pliny the Younger, and Juvenal," had been long familiar. He now "plunged into the ocean of the Augustan history," and "with pen almost always in hand," pored over all the original records, Greek and Latin, between Trajan and the last of the Western Cæsars. "The subsidiary rays of medals and inscriptions, of geography and chronology, were thrown on their proper objects; and I applied the collections of Tillemont, whose inimitable accuracy almost assumes the character of genius, to fix and arrange within my reach the loose and scattered atoms of historical information." The Christian apologists and their pagan assailants; the Theodosian Code, with Godefroy's commentary; the *Annals and Antiquities* of Muratori, collated with "the parallel or transverse lines" of Sigonius and Maffei, Pagi and Baronius, were all critically studied. Still following the wise maxim which he had adopted as a student, "multum legere potius quam multa," he reviewed again and again the immortal works of the French and English, the Latin and Italian classics. He deepened and extended his acquaintance with Greek, particularly with his favorite authors Homer and Xenophon; and, to crown all, he succeeded in achieving the third perusal of Blackstone's *Commentaries*.

The course of his study was for some time seriously interrupted by his father's illness and death in 1770, and by the many distractions connected with the transference of his residence from Buriton to London. It was not, indeed, until October, 1772, that he found himself at last independent, and fairly settled in his house and library, with full leisure and opportunity to set about the composition of the first volume of his history. Even then it appears from his own confession that he long brooded over the chaos of materials he had amassed before light dawned upon it. At the commencement, he says, "all was dark and doubtful;" the limits, divisions, even the title of his work were undetermined; the first chapter was composed three times, and the second and third twice, before he was satisfied with his efforts. This prolonged meditation on his design and its execution was ultimately well repaid by the result: so methodical did his ideas become, and so readily did his materials shape themselves, that, with the above exceptions, the original MS. of the entire six quartos was sent uncopied to the printers. He also says that not a sheet had been seen by any other eyes than those of author and printer, a statement indeed which must be taken with a small deduction; or rather we must suppose that a few chapters had been submitted, if not to the "eyes," to the "ears" of others; for he elsewhere tells us that he was "soon disgusted with the modest practice of reading the manuscript to his friends." Such, however, were his preliminary difficulties that he confesses he was often "tempted to cast away the labor of seven years;" and it was not until February, 1776, that the first volume was published. The success was instant, and, for a quarto, probably unprecedented. The entire impression was exhausted in a few days; a second and a third edition were scarcely adequate to the demand. The author might almost have said, as Lord Byron after the publication of *Childe Harold*, that "he awoke one morning and found himself famous." In addition to public applause, he was gratified by the more select praises of the highest living authorities in that branch

of literature: "the candor of Dr. Robertson embraced his disciple;" Hume's letter of congratulation "overpaid the labor of ten years." The latter, however, with his usual sagacity, anticipated the objections which he saw could be urged against the famous fifteenth and sixteenth chapters. "I think you have observed a very prudent temperament; but it was impossible to treat the subject so as not to give grounds of suspicion against you, and you may expect that a clamor will arise."

The "clamor" thus predicted was not slow to make itself heard. Within two years the famous chapters had elicited what might almost be called a library of controversy. The only attack, however, to which Gibbon deigned to make any reply was that of Davies, who had impugned his accuracy or good faith. His *Vindication* appeared in February, 1779; and, as Milman remarks, "this single discharge from the ponderous artillery of learning and sarcasm laid prostrate the whole disorderly squadron" of his rash and feeble assailants.[1]

Two years before the publication of this first volume Gibbon was elected member of parliament for Liskeard (1774). His political duties did not suspend his prosecution of his history, except on one occasion, and for a little while, in 1779, when he undertook, on behalf of the ministry, a task which, if well performed, was also, it must be added, well rewarded. The French Government had issued a manifesto preparatory to a declaration of war, and Gibbon was solicited by Chancellor Thurlow and Lord Weymouth, secretary of state, to answer it. In compliance with this request he produced the able *Mémoire Justificatif*, composed in French, and delivered to the courts of Europe; and shortly afterwards he received a seat at the Board of Trade and Plantations,—little more than a sinecure in itself, but with a very substantial salary of nearly £800 per annum. His acceptance displeased some of his former political associates, and he was accused of "deserting his party." In his *Memoir*, indeed, Gibbon denies that he had ever enlisted with the Whigs. A note of Fox, however, on the margin of a copy of *The Decline and Fall* records a very distinct remembrance of the historian's previous vituperation of the ministry; within a fortnight of the date of his acceptance of office, he is there alleged to have said that "there was no salvation for this country until six heads of the principal persons in administration were laid upon the table." Lord Sheffield merely replies, somewhat weakly it must be said, that his friend never intended the words to be taken literally. More to the point is the often-quoted passage from Gibbon's letter to Deyverdun, where the frank revelation is made: "You have not forgotten that I went into parliament without patriotism and without ambition, and that all my views tended to the convenient and respectable place of a lord of trade."

In April, 1781, the second and third quartos of his *History* were published. They excited no controversy, and were comparatively little talked about—so little, indeed, as to have extorted from him a half murmur about "coldness and prejudice." The volumes, however, were bought and read with silent avidity. Meanwhile public events were developing in a manner that had a considerable influence upon the manner in which the remaining years of the historian's life were spent. At the general election in 1780 he had lost his seat for Liskeard, but had subsequently been elected for Lymington. The ministry of Lord North, however, was tottering, and soon after fell; the Board of Trade was abolished by the passing of Burke's bill in 1782, and Gibbon's salary vanished with it,—no trifle, for his expenditure had been for three years on a scale somewhat disproportionate to his private fortune. He did not like to depend on statesmen's promises, which are proverbially uncertain of fulfilment; he as little liked to retrench; and he was wearied of parliament, where he had never given any but silent votes. Urged by such considerations, he once more turned his eyes to the scene of his early exile, where he might live on his decent patrimony in a style which was impossible in England, and pursue unembarrassed his literary studies. He therefore resolved to fix himself at Lausanne.

A word only is necessary on his parliamentary career. Neither nature nor acquired habits qualified him to be an orator; his late entrance on public life, his natural timidity, his feeble voice, his limited command of idiomatic English, and even, as he candidly confesses, his literary fame, were all obstacles to success. "After a fleeting, illusive hope, prudence condemned me to acquiesce in the humble station of a mute.[2] . . . I was not armed by nature and education with the intrepid energy of mind and voice—'Vincentem strepitus et natum rebus agendis.' Timidity was fortified by pride, and even the success of my pen discouraged the trial of my voice." His repugnance to public life had been strongly expressed to his father in a letter of a very early date, in which he begged that the money which a seat in the House of Commons would cost, might be expended in a mode more agreeable to him. Gibbon was eight-and-thirty when he entered parliament; and the obstacles which even at an earlier period he had not had courage to encounter, were hardly likely to be vanquished then. Nor had he much political sagacity. He was better skilled in investigating the past than in divining the future. While Burke and Fox and so many great statesmen proclaimed the consequences of the collision with America, Gibbon saw nothing but colonies in rebellion, and a paternal Government justly incensed. His silent votes were all given on that hypothesis. In a similar manner, while he abhorred the French Revolution when it came, he seems to have had no apprehension, like Chesterfield, Burke, or even Horace Walpole, of its approach; nor does he appear to have at all suspected that it had had anything to do with the speculations of the philosophic coteries in which he had taken such delight. But while it may be doubted whether his presence in Parliament was of any direct utility to the legislative business of the country, there can be no question of the present advantage which he derived from it in the prosecution of the great work of his life,—an advantage of which he was fully conscious when he wrote: "The eight sessions that I sat in parliament were a school of civil prudence, the first and most essential virtue of an historian."

Having sold all his property except his library—to him equally a necessary and a luxury—Gibbon repaired to Lausanne in September, 1783, and took up his abode with his early friend Deyverdun, now a resident there. Perfectly free from every engagement but those which his own tastes imposed, easy in his circumstances, commanding just as much society, and that as select, as he pleased, with the noblest scenery spread out at his feet, no situation can be imagined more favorable for the prosecution of his literary enterprise; a hermit in his study as long as he chose, he found the most delightful recreation always ready for him at the threshold. "In London," says he, "I was lost in the crowd; I ranked with the first families in Lausanne, and my style of prudent expense enabled me to maintain a fair balance of reciprocal civilities. . . . Instead of a small house between a street and a stable-yard, I began to occupy a spacious and convenient mansion, connected on the north side with the city, and open on the south to a beautiful and boundless horizon. A garden of four acres had been laid out by the taste of M. Deyverdun; from the garden a rich scenery of meadows and vineyards descends to the Leman Lake, and the prospect far beyond the lake is crowned by the stupendous mountains of Savoy." In this enviable retreat, it is no wonder that a year should have been suffered to roll round before he vigorously resumed his great work,—and with many men it would never have been resumed in such a paradise. We may remark in passing, that the re-

[1] For a very full list of publications in answer to Gibbon's attack on Christianity reference may be made to the *Bibliographer's Manual*, pp. 885-6 (1858). Of these the earliest were Watson's *Apology* (1776), Salisbury's *Strictures* (1776), and Chelsum's (anonymous) *Remarks* (1776). In 1778 the *Few Remarks* by a Gentleman (Francis Eyre), the *Reply* of Loftus, the *Letters* of Apthorpe, and the *Examination* of Davies appeared. Gibbon's *Vindication* (1779) called forth a *Reply* by Davies (1779), and *A Short Appeal to the Public* by Francis Eyre (1779). Laughton's polemical treatise was published in 1780, and those of Milner and Taylor in 1781. Chelsum returned to the attack in 1785 (*A Reply to Mr. Gibbon's Vindication*), and Sir David Dalrymple (*An Inquiry into the Secondary Causes*, etc.) made his first appearance in the controversy in 1786. Travis's *Letters on 1 John v. 7* are dated 1784; and Spedalieri's *Confutazione dell' Esame del Cristianismo fatto da Gibbon* was published at Rome (2 vols. 4to) in the same year. It is impossible not to concur in almost every point with Gibbon's own estimate of his numerous assailants. Their crude productions, for the most part, were conspicuous rather for insolence and abusiveness than for logic or learning. Those of Bishop Watson and Lord Hailes were the best, but simply because they contented themselves with a dispassionate exposition of the general argument in favor of Christianity. The most foolish and discreditable was certainly that of Davies; his unworthy attempt to depreciate the great historian's learning, and his captious, cavilling, acrimonious charges of petty inaccuracies and discreditable falsification gave the object of his attack an easy triumph.

[2] In 1775 he writes to Holroyd, "I am still a mute; it is more tremendous than I imagined; the great speakers fill me with despair; the bad ones with terror."

treat was often enlivened, or invaded, by friendly tourists from England, whose "frequent incursions" into Switzerland our recluse seems half to lament as an evil. Among his more valued visitors were M. and Mme. Necker; Mr. Fox also gave him two welcome "days of free and private society" in 1788. Differing as they did in politics, Gibbon's testimony to the genius and character of the great statesman is highly honorable to both: "Perhaps no human being," he says, "was ever more perfectly exempt from the taint of malevolence, vanity, or falsehood."

When once fairly reseated at his task, he proceeded in this delightful retreat leisurely, yet rapidly, to its completion. The fourth volume, partly written in 1782, was completed in June, 1784; the preparation of the fifth volume occupied less than two years; while the sixth and last, begun 18th May, 1786, was finished in thirteen months. The feelings with which he brought his labors to a close must be described in his own inimitable words: "It was on the day, or rather night, of the 27th of June, 1787, between the hours of eleven and twelve, that I wrote the last lines of the last page in a summer house in my garden. After laying down my pen, I took several turns in a *berceau* or covered walk of acacias, which commands a prospect of the country, the lake, and the mountains. The air was temperate, the sky was serene, the silver orb of the moon was reflected from the waters, and all nature was silent. I will not dissemble the first emotions of joy on the recovery of my freedom, and, perhaps, the establishment of my fame. But my pride was soon humbled, and a sober melancholy was spread over my mind by the idea that I had taken an everlasting leave of an old and agreeable companion, and that whatsoever might be the future date of my *History*, the life of the historian must be short and precarious."

Taking the manuscript with him, Gibbon, after an absence of four years, once more visited London in 1787; and the 51st anniversary of the author's birthday (27th April, 1788) witnessed the publication of the last three volumes of *The Decline and Fall*. They met with a quick and easy sale, were very extensively read, and very liberally and deservedly praised for the unflagging industry and vigor they displayed, though just exception, if only on the score of good taste, was taken to the scoffing tone he continued to maintain in all passages where the Christian religion was specially concerned, and much fault was found with the indecency of some of his notes.[1]

He returned to Switzerland in July, 1788, cherishing vague schemes of fresh literary activity; but genuine sorrow caused by the death of his friend Deyverdun interfered with steady work, nor was it easy for him to fix on a new subject which should be at once congenial and proportioned to his powers; while the premonitory mutterings of the great thunderstorm of the French Revolution, which reverberated in hollow echoes even through the quiet valleys of Switzerland, further troubled his repose. For some months he found amusement in the preparation of the delightful *Memoirs* (1789) from which most of our knowledge of his personal history is derived; but his letters to friends in England, written between 1788 and 1793 occasionally betray a slight but unmistakable tone of *ennui*. In April, 1793, he unexpectedly received tidings of the death of Lady Sheffield; and the motive of friendship thus supplied combined with the pressure of public events to urge him homewards. He arrived in England on the following June, and spent the summer at Sheffield Place, where his presence was even more highly prized than it had ever before been. Returning to London early in November, he found it necessary to consult his physicians for a symptom which, neglected since 1761, had gradually become complicated with hydrocele, and was now imperatively demanding surgical aid; but the painful operations which had to be performed did not interfere with his customary cheerfulness, nor did they prevent him from paying a Christmas visit to Sheffield Place. Here, however, fever made its appearance; and a removal to London (January 6, 1794) was considered imperative. Another operation brought him some relief; but a relapse occurred during the night of the 15th, and on the following day he peacefully breathed his last. His remains were laid in the burial place of the Sheffield family, Fletching, Sussex, where an epitaph by Dr. Parr describes his character and work in the language at once of elegance, of moderation, and of truth.

The personal appearance of Gibbon as a lad of sixteen is brought before us somewhat dimly in M. Pavilliard's description of the "thin little figure, with a large head, disputing and arguing, with the greatest ability, all the best arguments that had ever been used in favor of popery." What he afterwards became has been made more vividly familiar by the clever silhouette prefixed to the *Miscellaneous Works* (Gibbon himself, at least, we know, did not regard it as a caricature), and by Sir Joshua Reynolds's portrait so often engraved. It is hardly fair perhaps to add a reference to Suard's highly-colored description of the short Silenus-like figure, not more than 56 inches in height, the slim legs, the large turned-in feet, the shrill piercing voice; but almost every one will remember, from Croker's *Boswell*, Colman's account of the great historian "tapping his snuff-box, smirking and smiling, and rounding his periods" from that mellifluous mouth. It has already been seen that Gibbon's early ailments all left him on the approach of manhood; thenceforward, "till admonished by the gout," he could truly boast of an immunity well-nigh perfect from every bodily complaint; an exceptionally vigorous brain, and a stomach "almost too good," united to bestow upon him a vast capacity alike for work and for enjoyment. This capacity he never abused so as to burden his conscience or depress his spirits. "The madness of superfluous health I have never known." To illustrate the intensity of the pleasure he found alike in the solitude of his study and in the relaxations of genial social intercourse, almost any page taken at random, either from the *Life* or from the *Letters*, would suffice; and many incidental touches show that he was not a stranger to the delights of quiet contemplation of the beauties and grandeurs of nature. His manners, if formal, were refined; his conversation, when he felt himself at home, interesting and unaffected; and that he was capable alike of feeling and inspiring a very constant friendship there are many witnesses to show. That his temperament at the same time was frigid and comparatively passionless cannot be denied; but neither ought this to be imputed to him as a fault; hostile criticisms upon the grief for a father's death, that "was soothed by the conscious satisfaction that I had discharged all the duties of filial piety," seem somewhat out of place. His most ardent admirers, however, are constrained to admit that he was deficient in large-hearted benevolence; that he was destitute of any "enthusiasm of humanity;" and that so far as every sort of religious yearning or aspiration is concerned, his poverty was almost unique. Gibbon was such a man as Horace might have been, had the Roman Epicurean been fonder of hard intellectual work, and less prone than he was to the indulgence of emotion.

Of Gibbon's mental qualities it is interesting to read the estimate formed and recorded by himself on his twenty-sixth birthday [May 8th, N. S., 1762]: "Wit I have none. My imagination is rather strong than pleasing. My memory both capacious and retentive. The shining qualities of my understanding are extensiveness and penetration; but I want both quickness and exactness." Twenty-six years afterwards he wrote on the same subject in his *Memoirs*:—"The original soil has been highly improved by cultivation; but it may be questioned whether some flowers of fancy, some grateful errors, have not been eradicated with the weeds of prejudice." No student of *The Decline and Fall* will accuse its author of immodesty or vanity in these self-appreciations, but will rather be surprised that he should have so considerably underestimated both his endowments and his acquirements. Of the kind and amount of varied ability displayed in that truly immortal work it would be almost impossible to speak in language of exaggerated praise,—the grandeur and vastness of conception, the artistic grouping, the masterly fulness and accuracy of detail, the richness and vividness of description, the coruscating liveliness, the polished sarcasm, the pungent wit. The history of Rome is, for the many centuries which Gibbon treats, the history of the world; and it is nothing less than astonishing that he should have been able to work with so much ease the vast and incongruous materials into such a unity of design. It is the amplest historic canvas ever spread, the largest historic painting ever executed by a single hand; and only a comprehensive and orderly intel-

[1] An anonymous pamphlet, entitled *Observations on the three last volumes of the Roman History*, appeared in 1788; Disney's *Sermon, with Strictures*, in 1790; and Whitaker's *Review*, in 1791. With regard to the second of the above complaints, surprise will probably be felt that it was not extended to portions of the text as well as to the notes.

lect of the highest rank could have grappled as Gibbon has done with the task of blending that vast array of nations, in all their varieties of costume, habit, language, and religion, into one picturesque and harmonious whole. If Gibbon had ever been conscious of any inexactitude in his mental habit, it was a defect which he very early and very successfully remedied. No man could declare more honestly than he that "curiosity as well as duty had led him carefully to examine all the original documents that could illustrate the subject which he had undertaken to treat." With incredible labor he was able to bring at last to his great life-work a mind capable equally of ascending to the most comprehensive, and of descending to the most minute surveys; of appreciating the beautiful and sublime in classic literature, and yet of delighting in the verbal criticism, the tedious collation, and dry antiquarian research by which the text is established or illustrated; of celebrating the more imposing events of history with congenial pomp of description, and of investigating with the dullest plodder's patience and perseverance the origin of nations, the emigrations of obscure tribes, and the unpromising yet instructive problems which ethnology presents. In his pages the widest deductions of historic philosophy alternate with attempts to fix the true reading of an obscure passage or a minute point of chronology or geography. It may even be said that in these last investigations he took almost as much delight as in depicting the grander scenes of history, and surrendered himself as absolutely for the time to the early migrations of the Goths and Scythians as to the campaigns of Belisarius or the conquests of the Saracens. Never has historian evinced greater logical sagacity in making comparatively obscure details yield important inferences, or held with firmer hand the balance in the case of conflicting probabilities; by no one has sounder judgment or greater self-control been, on the whole, more uniformly exhibited in cases where it is so easy for learned enthusiasm to run into fanciful hypotheses.

While thus entitled to great and manifold praise, *The Decline and Fall* has not been, and can never be, exempt from a certain measure of just censure. Even when the occasional Gallicisms and grammatical absurdities pointed out by the industry of critics have been willingly overlooked, there yet remains something to be said on the defects of its style. Precise, energetic, massive it is; splendid, when the pictorial demands of the narrative require it, as that of Livy; and sometimes, where profound reflections are to be concisely expressed, as sententious and graphic as that of Tacitus. But with all its great merits it is too often formal and inflexible, and is apt to pall on the ear by the too frequent recurrence of the same cadence at equal intervals, and the too unsparing use of antithesis. It is not veined marble, but an exquisite tessellation; not the fluent naturally-winding stream, but a stately aqueduct, faced with stone, adorned with wooded embankments, or flowing over noble arches, but an aqueduct still. It is a just criticism of Sir James Mackintosh that probably no great writer ever derived less benefit from his professed models. Pascal, Voltaire, Hume, were his delight; and he acknowledges, as so unsuccessful a pupil well might, that he often closed the pages of the last with a feeling of despair. Addison and Swift he read for the very purpose of improving his acquaintance with idiomatic English, yet, as the above critic remarks, "with so little success, that in the very act of characterizing these writers, he has deviated not a little from that beautiful simplicity which is their peculiar distinction."

In a work of such extent it is a venial fault that the workmanship should not in all parts be equally perfect; "aliquando bonus dormitat." That Gibbon has sometimes failed in that lucidity of statement which is one of his very strongest characteristics has often been successfully pointed out; and special reference may be made to the 59th chapter, where he treats of the crusades. In this instance by "a brief parallel" he has sought to save himself "the repetition of a tedious narrative," but has only succeeded in presenting a superficial sketch that cannot be otherwise characterized than as confused and badly written. Nor has his penetration enabled him in all cases to reach the true significance of some of the grander facts which, in order to the adequate discharge of his task, it was of the highest importance that he should have rightly understood. Here it is not necessary to adduce any minor instances, when it can be shown that he is out of harmony with the truth, or at least with the truth as apprehended by the 19th century, in a matter so fundamental as his conception of that empire which declined and fell, and of that Christianity which, as he rightly supposes, contributed to its overthrow.

In Mirabeau's correspondence there occurs a letter to Sir Samuel Romilly containing the following criticism:—"I have never been able to read the work of M. Gibbon without being astounded that it should ever have been written in English; or without being tempted to turn to the author and say, 'You an Englishman? No, indeed! That admiration for an empire of more than two hundred millions of men, where not one had the right to call himself free; that effeminate philosophy which has more praise for luxury and pleasures than for all the virtues; that style always elegant and never energetic, reveal at the most the elector of Hanover's slave.'"[1] Here Mirabeau speaks in his own language what every one who in the least values the characteristic features of modern political life must, however inarticulately, have often felt. Gibbon's enthusiasm for the empire of Trajan and the Antonines—that "solid fabric of human greatness"—is undisguised and perfectly sincere; to his thinking, if the earth ever enjoyed a golden age, it was then. The world was happy because it was under a government which it could never think of questioning or resisting,—happy because for once it had got rid of all unavailing enthusiasms, whether political or religious. Whether it was happy, and whether any happiness it really possessed was not rather in spite of than because of the prevalent political and religious indifference, are questions which not many historians will care to answer as Gibbon did. It is manifest, however, that to him, thinking of the Roman empire as he did, it was well nigh impossible to be just to Christianity. He could never forgive a religion which, in his opinion, had overthrown "the solid fabric of human greatness," and given to the world the sorry sight of bare-footed friars chanting psalms on the spot where once had been the august worship in which everybody took part and positively no one believed. This explains why one who can treat each and all of the ethnic religions with the cold impartiality of a Chinese literatus[2] is unable when Christianity comes to be discussed to conceal his heartfelt dislike. Comparing "superstition" with "superstition," virtue with virtue, vice with vice, Gibbon had formed a deliberate preference for the religion and ethics of ancient Rome. Philosophical students of history, even though they may feel themselves unable to subscribe the Athanasian creed, may now be said to be almost unanimous, however, in finding that the phenomenon called Christianity did mean for mankind a higher conception of truth and a nobler conception of duty.

Upon the famous fifteenth and sixteenth chapters it is not necessary to dwell, because at this time of day no Christian apologist dreams of denying the substantial truth of any of the more important allegations of Gibbon. Christians may complain of the suppression of some circumstances which might influence the general result; and they must remonstrate against the unfair construction of their case. But they no longer refuse to hear any reasonable evidence tending to show that persecution was less severe than had once been believed; and they have slowly learned that they can afford to concede the validity of all the secondary causes assigned by Gibbon, and even of others still more discreditable. The fact is, as the historian himself has again and again admitted, that his account of the secondary causes which contributed to the progress and establishment of Christianity leaves the question as to the natural or supernatural origin of Christianity practically untouched; that question still continues to be agitated, but the battle is fought on a new field and with other weapons than those selected by Gibbon.

Of the original quarto edition of *The Decline and Fall*, vol i. appeared, as has already been stated, in 1776, vols. ii. and iii. in 1781, and vols. iv.–vi. (inscribed to Lord North) in 1788. In later editions vol. i. was considerably altered by the author; the others hardly at all. The number of modern reprints has been very considerable; but the most important and valuable English edition is that of Milman (1839 and 1845), still more recently enriched under the editorship of Dr. W. Smith (8 vols. 8vo, 1854 and 1872). As a curiosity of literature Bowdler's edition, "adapted to the use of families and young persons" by the expurgation of "the indecent expressions and all allu-

[1] See Sainte-Beuve, *Causeries*, viii. 460.

[2] "Il a du lettré chinois dans sa manière d'appréeier les religions."—Sainte-Beuve.

sions of an improper tendency" (5 vols. 8vo, 1825), may be specially noticed. The French translation of Le Clerc de Septchênes, continued by Démeunier, Boulard, and Cantwell (1788–1795), has been frequently reprinted in France. It seems to be certain that the portion usually attributed to Septchênes was, in part, at least, the work of his distinguished pupil, Louis XVI. A new edition of the complete translation, prefaced by a letter on Gibbon's life and character, from the pen of Suard, and annotated by Guizot, appeared in 1812 (and again in 1828). There are at least two German translations of *The Decline and Fall*, one by Wenck, Schreiter, and Beck (1805–1807), and a second by Sporschil (1862). The Italian translation (alluded to by Gibbon himself) was, along with Spedalieri's *Confutazione*, reprinted at Milan in 1823. Gibbon's *Miscellaneous Works, with Memoirs of his Life and Writings, composed by himself; illustrated from his letters, with occasional Notes and Narrative*, published by Lord Sheffield in two volumes in 1796, has been often reprinted. The new edition in five volumes (1814) contained some previously unpublished matter, and in particular the fragment on the revolutions of Switzerland. A French translation of the *Miscellaneous Works* by Marigné appeared at Paris in 1798. There is also a German translation (Leipsic, 1801). It may be added that a special translation of the chapter on Roman Law (*Gibbon's historische Uebersicht des Römischen Rechts*) was published by Hugo at Göttingen in 1839, and has frequently been used as a text-book in German universities. (H. RO.—J. S. BL.)

GIBBONS, GRINLING (1648–1721), a celebrated English wood-carver, was born in 1648, according to some authorities, of Dutch parents at Rotterdam, and according to others, of English parents at London. By the former he is said to have come to London after the great fire in 1666. He early displayed great cleverness and ingenuity in his art, on the strength of which he was recommended by Evelyn to Charles II., who employed him in the execution both of statuary and of ornamental carving in wood. In statuary one of his principal works is a life-size bronze statue in the court of Whitehall, representing James II. in the dress of a Roman emperor, and he also designed the base of the statue of Charles I. at Charing Cross. It is, however, chiefly as an engraver in wood that he has acquired a reputation. He was employed to execute the ornamental carving for the chapel at Windsor, the foliage and festoons in the choir of St. Paul's, the baptismal fonts in St. James's, and an immense quantity of ornamental work at Burleigh, Chatsworth, and other aristocratic mansions. The finest of all his productions in this style is believed to be the ceiling which he devised for a room at Petworth. His subjects are chiefly birds, flowers, foliage, fruit, and lace, and many of his works, for delicacy and elaboration of details, and truthfulness of imitation, have never been surpassed. He, however, sometimes wasted his ingenuity on trifling subjects: many of his flowers used to move on their stems like their natural prototypes when shaken by a breeze. In 1714 Gibbons was appointed master carver in wood to George I. He died at London, August 3, 1721.

GIBBONS, ORLANDO (1583–1625), like Johann Sebastian Bach, was the most illustrious of a family of musicians all more or less able. We know of at least three generations of musical Gibbons, for Orlando's father, William Gibbons, having been one of the waits of Cambridge, may be assumed to have acquired some proficiency in the art. His three sons, and at least one of his grandsons, inherited and further developed his talent. The eldest, Edward, was made bachelor of music at Cambridge, and successively held important musical appointments at the cathedrals of Bristol and Exeter; Ellis, the second son, was organist of Salisbury Cathedral, and is the composer of two madrigals in the collection known as the *The Triumphs of Oriana*. Orlando Gibbons, the youngest and by far the most celebrated of the brothers, was born at Cambridge in 1583. Where and under whom he studied is not known, but in his twenty-first year he was sufficiently advanced and celebrated to receive the important post of organist of the Chapel Royal. His first published composition, "Fantasies in three parts, composed for viols," appeared in 1610. It seems to have been the first piece of music printed in England from engraved plates, or "cut in copper, the like not heretofore extant." In 1622 he was created doctor of music by the university of Oxford. For this occasion he composed an anthem for eight parts, *O clap your Hands*, still extant. In the following year he became organist of Westminster Abbey. Orlando Gibbons died before the beginning of the civil war, or it may be supposed that, like his eldest brother, he would have been a staunch royalist. In a different sense, however, he died in the cause of his master; for having been summoned to Canterbury to produce a composition written in celebration of Charles's marriage, he there fell a victim to small-pox on June 5, 1625. Of his life very little is known, but that little is well summed up in the article contributed by Mr. W. H. Husk to Dr. Grove's *Dictionary of Music and Musicians*, where a complete list of his compositions is also given. His portrait may be found in Hawkins's well-known *History*. The works of Gibbons may be divided into secular and sacred compositions, the latter being by far the most important portion. His vocal pieces, madrigals, motets, canons, songs, etc., are admirable specimens of part-writing, and prove him to have been a perfect master of polyphonous treatment. Many of them are for five voices, a very common number in those days; but pieces for four and for six voices also are by no means rare. To the first-named class belong a *Te Deum* in D minor, two sets of *Preces* and other compositions for church service, also most of the madrigals. We have also some specimens of his instrumental music, such as the six pieces for the virginals published in *Parthenia*, a collection of instrumental music produced by Gibbons in conjunction with Dr. Bull and Byrd.

GIBEON, a town famous in Old Testament history, known under the name of El Jîb, situated 5 miles north-west of Jerusalem. It is now a small village standing on an isolated hill above a flat corn valley. The famous spring (2 Sam. ii. 13) comes out from under a cliff on the south-east side of the hill, and the water runs to a reservoir lower down. The sides of the hill are rocky, and remarkable for the regular stratification of the limestone, which gives the hill at a distance the appearance of being stepped. Scattered olive groves surround the place. The name is derived from the Hebrew root *qabah*, signifying "prominence," and there are throughout Palestine many ancient sites situate on rocky knolls which receive names (*e. g.*, Gibeah, Geba, Gabe, Gaba—nearly all represented by the present Jeba) derived from this same root.

GIBRALTAR, a British fortress and town in the south of Spain, occupying a grand peninsular headland, which stretches almost due south in a line with the eastern coast of the province of Andalusia, separating the Bay of Algeciras from the open sea of the Mediterranean, and commanding the strait by which the Mediterranean communicates with the Atlantic. Its latitude is 36° 6′ 23″ N., and its longitude 5° 20′ 55″ W. The "rock," as the promontory is familiarly called, is about 2½ miles in length, with a varying breadth of from 2 to 6 furlongs. Rising abruptly from the low sandy isthmus which connects it with the mainland to a height of 1200 feet, the main ridge continues south for about 1½ miles, being separated by two transverse depressions, known respectively as the Northern and Southern Quebrada, into three pretty distinct summits—the Wolf's Crag or North Front, the Middle Hill or Signal Station (1255 feet high), and the Pan de Azucar or Sugar Loaf Hill, dominated by O'Hara's tower (1408 feet). This last summit descends somewhat abruptly on the south to the Windmill Plateau, an almost level area about half a mile in length by a quarter in breadth, which, from a height of 400 feet above the sea, slopes south till it is only 300 feet above the sea, and then in its turn sinks abruptly for about 200 feet to the Europa Plateau, which, also sloping seaward, terminates in a cliff about 50 feet high. Towards the east or Mediterranean side the promontory presents as precipitous and inaccessible a front as towards the north, but towards the west the ascent is comparatively gradual, though interrupted by longitudinal cliffs and ravines, and a considerable space of fairly level ground at the foot affords a site for the town.

The basement rock of Gibraltar is for the most part a greyish white or pale grey limestone, of compact and sometimes crystalline texture, arranged in beds, but in some places apparently amorphous. Above the limestone is a series of dark greyish blue shales with intercalated beds and bands of grit, sandstone, and limestone; and distributed here and there about the promontory are various limestone breccias, bone-breccias, and calcareous sandstones, as well as loose sand and debris. It is evident that the whole promontory has had an eventful geological history in comparatively recent periods. The limestone and the shales are both of Lower Jurassic age, but the rest of the formations are of much more ancient date. According to the researches of Professors Ramsay and Geikie ("Geology of Gibraltar," in the *Quarterly Journal of the Geological So-*

*ciety*, London, 1878), the oldest superficial accumulation is the unfossiliferous limestone breccia of Buena Vista, which must have been formed under somewhat severer climatic conditions than the present, and when the rock had a wider area of low ground at its base. This period was probably followed by one with a genial climate, during which the promontory, if indeed it was not rather an isthmus between Europe and Africa, was clothed with vegetation and inhabited by a rich mammalian fauna, whose remains are still found in the Genista caves. Next there came a subsidence of a large proportion of the rock to the extent of 700 feet below the present level, the consequent erosion of ledges and platforms, and the formation of the calcareous sandstones which have incorporated shells of recent Mediterranean species. The process of depression was apparently interrupted by pauses. On its re-elevation, the land

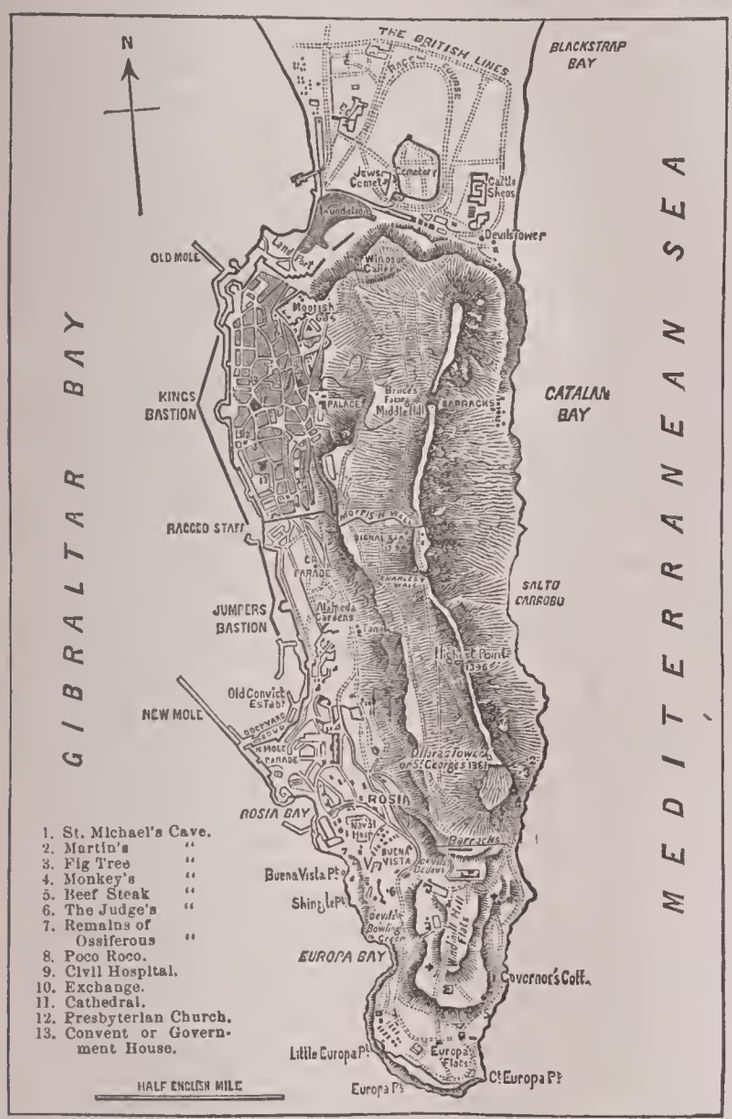

Chart of Gibraltar.

was again of greater extent than now; Africa and Europe were perhaps reunited, and the climate was probably genial. By a new depression the rock was brought into its present geographical relations.

Like most masses of limestone formation, the promontory of Gibraltar is honeycombed with caverns and subterraneous passages, and the Genista cave, already incidentally mentioned, is only one of the many to which it owes the title of the Hill of Caves. A special interest attaches to some of them for the palæontological and archæological remains which they yielded to the explorations of Captain Brome between 1863 and 1868. St. Michael's Cave, which is the most frequently visited by strangers, has its entrance about 1100 feet above the sea on the western face of the rock in the line of the Southern Quebrada. A rapid slope of earth gives admission to a hall 200 feet long by 70 feet high, the roof of which appears as if it were supported by massive stalactite pillars; and from this hall access is obtained to a series of four similar caves connected with each other by tortuous passages, the last cave being situated about 300 feet below the surface and about 400 feet of travelling distance south by west from the entrance. The first of the four was called Victoria cave by its discoverer Captain Brome, and the three others, being more closely associated, received the common name of Leonora's caves. "Nothing," says Captain Brome, "can exceed the beauty of the stalactites; they form clusters of every imaginable shape—statuettes, pillars, foliages, figures. Even the American visitors have been compelled to acknowledge that, as regards beauty and picturesqueness, even the Mammoth Cave would not come near them." The mammalian remains of the Genista cave have been investigated by Mr. Busk ("Quaternary Fauna of Gibraltar," in *Trans. of Zool. Soc.*, vol. x., p. 2, 1877), and found to comprise specimens of a bear, probably *Ursus fossilis* of Goldfuss; a hyæna, probably *H. crocuta* or *spelæa;* various species of cats, from the size of a leopard to that of a wild cat; a rhinoceros similar to the species found in the valley of the Thames; two forms of ibex; and the hare and the rabbit. No trace has been discovered of *Rhinoceros tichorinus*, of *Ursus spelæus*, or of the reindeer, and the only relic of the elephant as yet registered within the peninsula is a perfect specimen of the penultimate upper molar tooth of *Elephas antiquus*. For further details see James Smith of Jordanhill "On the geology of Gibraltar," in *Quart. Journ. of Geol. Soc.*, vol. ii., and G. Busk and Hugh Falconer "On the Fossil Contents of the Genista Cave," in *Quart. Journ. of Geol. Soc.*, vol. xxi., reprinted in Falconer's *Palæontological Memoirs*, London, 1868.

To the voyager entering the straits the rock presents a bare and almost barren aspect, especially when the summer suns have dried up the verdure; but as he approaches he discovers a considerable clothing of vegetation, and closer acquaintance reveals the existence of an extensive flora. Here and there a grassy glen gives shelter to a group of trees, and the villas of the English residents are surrounded with luxuriant gardens and copses. Dr. E. F. Kelaart in his *Flora Calpensis* (London, 1846) enumerates upwards of 400 flowering plants and ferns as indigenous to Gibraltar, and about fifty as introduced. Of the former a few appear to be species peculiar to the rock. White poplars, the cotton-tree, the pepper-tree or pimenta, the ilex, and the pine are the most noticeable of the larger trees; the bella-sombra (*Phytolacca dioica*), introduced by General Don, the aloe, and the prickly pear are common; and on the eastern side of the rock the dwarf palm (*Chamærops humilis*) covers large areas. Among the fruit trees, which, however, are cultivated rather for ornament than for profit, may be mentioned the almond, the olive, the orange, the lemon, the pomegranate, the fig, and the loquat. In January and February many portions of the rock present a charming sight from the profusion and beauty of the wild flowers. The fauna of Gibraltar is naturally poor,—rabbits, foxes, partridges, pigeons, and woodcocks being the principal species. The little Barbary apes, of which every schoolboy has heard, but which not every resident in Gibraltar has seen, are few in number, not more than twenty perhaps, and they usually inhabit the higher and eastern parts of the rock, except when they are driven towards the lower grounds by the cold winds from the north-east. They then do a little damage to the fruit trees; but they enjoy impunity as perfect as that of the storks in Holland or the ibis in Egypt. As to its climate Gibraltar belongs to the subtropical zone, with a dry summer and a rainy season in winter. More than half the rainfall of the year, which only amounts to about 28 or 30 inches, occurs in November, December, and January; and the three months of June, July, and August are hardly refreshed by a shower. The temperature is subject to frequent disturbances: from 93° to 87° is the highest reached (July), and 43° the lowest (February), and the mean for the summer months is from 74° to 79°. In summer the heat is tempered by a sea-breeze which blows from about 10 A. M. till shortly before sunset. Easterly winds or levanters are common from July to November, and during their prevalence every living creature seems to suffer. Heavy dews and thick fogs occur in autumn, and are as disagreeable as they are unhealthy. In the early part of the present century Gibraltar was notoriously filthy and ill-drained, and epidemic diseases committed great ravages from time to time; but great improvements have been effected, especially through the sanitary

commission instituted in 1865. The inhabitants were formerly dependent on the rainfall for most of their water supply, the springs in the rock being both scanty and brackish; but in 1869 an abundant source of fairly good water was found to exist under the sands of the North Front, and pumps and conduits have been constructed for its distribution. In 1876 the quality of the water was reported to be deteriorating. Besides the private tanks, still numerous throughout the town, there are eight bomb-proof cisterns for rain-water, of a total capacity of 40,000 tons. The navy tank, for the supply of ships, holds from 9000 to 11,000 tons.

Gibraltar is emphatically a fortress, and in some respects its fortifications are unique. On the eastern side the rock needs no defence beyond its own precipitous cliffs, and in all other directions it has been rendered practically impregnable. Besides a sea-wall extending at intervals round the western base of the rock, and strengthened by curtains and bastions and three formidable forts, there are batteries in all available positions from the sea-wall up to the summit 1350 feet above the sea; and a remarkable series of galleries has been hewn out of the solid face of the rock towards the north and north-west. These galleries have an aggregate length of between 2 and 3 miles, and their breadth is sufficient to let a carriage pass. Port-holes are cut at intervals of 12 yards, so contrived that the gunners are safe from the shot of any possible assailants. At the end of one of the galleries hollowed out in a prominent part of the cliff is St. George's Hall, 50 feet long by 35 feet wide, in which the governor was accustomed to give fêtes. Alterations, extensions, and improvements are continually taking place in the defensive system, and new guns of the most formidable sort are gradually displacing or supplementing the old-fashioned ordnance. The whole population of Gibraltar, whether civil or military, is subjected to certain stringent rules. For even a day's sojourn the alien must obtain a pass from the town-major, and if he wish to remain longer a consul or householder must become security for his good behavior. Licenses of residence are granted only for short periods—ten, fifteen, or twenty days—but they can be renewed if occasion require. Military officers may introduce a stranger for thirty days. A special permit is necessary if the visitor wishes to sketch.

Though the town of Gibraltar may be said to date from the 14th century, it has preserved very little architectural evidence of its antiquity. Rebuilt on an enlarged and improved plan after its almost complete destruction during the great siege, it is still on the whole a mean-looking town, with narrow streets and lanes and an incongruous mixture of houses after the English and the Spanish types. As a proprietor may at any moment be called upon to give up his house and ground at the demand of the military authorities, he is naturally deterred from spending his money on substantial or sumptuous erections. The area of the town is about 100 acres. The public buildings comprise the cathedral of the Holy Trinity, a poor imitation of Moorish architecture; the governor's house, formerly a Franciscan monastery and still familiarly known as "The Convent;" the exchange; the court-house; the civil hospital; the revenue offices; and the garrison library, planned by Colonel Drinkwater in 1793. The library has excellent reading-rooms, and contains from 40,000 to 45,000 volumes. At the north-east corner of the town stand the remains of the Moorish castle. Towards the south the lower grounds are occupied by the Grand Parade and the Alameda Gardens, laid out by General Don in 1814; and beyond these are the old convict establishment, the dockyard, and the new mole parade. Further south, at Rosia, is the naval hospital, erected in 1771.

Gibraltar has been a free port since the year 1705,—a distinction which it owes in part to the refusal of the emperor of Morocco to allow the export of materials for the fortifications unless his subjects obtained full liberty of trade. In the early part of the present century the commercial activity of the little colony was remarkably great. While the average value per annum of British manufactures exported to the rest of Spain during the ten years from 1831 to 1840 was less than £385,000, the corresponding average for Gibraltar was more than £486,000; and in the year 1840 the ratio of Spain and Gibraltar was £404,252 to £1,111,176. Since that date there has been comparatively little advance,—the average annual value of all the British and colonial produce and manufactures for the ten years from 1868 to 1877 being £1,074,785. Besides the legitimate trade fostered by the demands of the garrison and the neighboring cities of Spain, Gibraltar has long had a large contraband traffic, especially in tobacco and Manchester goods. Mainly carried on by Spaniards, it continued to thrive in spite of the exertions of the Spanish authorities, and is now kept down mainly by the action of British officials. About 1200 tons of tobacco are sold annually in the Jews' Market; no fewer than eleven houses import upwards of 1000 tons annually; and its manufacture and manipulation give employment, it is said, to about 1550 persons. Fully two-thirds of the tobacco comes from Calcutta and other Indian ports. "Wool, grain, and wax from Morocco, fruit, wine, oil, and other produce from Spain, are sent to Gibraltar for transshipment to England, France, Germany, Belgium, Holland, Portugal, America, ports in the Mediterranean, India, and China." As a port of call the Bay of Gibraltar has recently increased in importance. Upwards of 5000 vessels enter the port annually, and of these more than half are propelled by steam. The average annual tonnage of the ships that entered between 1871 and 1875 was 2,069,508; and of this no less than 1,594,174 was British. Quarantine was established in 1830. By the shipping act of 1868 the governor was empowered to remove from the register any vessel guilty of a violation of the Spanish revenue laws discreditable to the British flag. In 1865 a duty was imposed on wines and spirits. Great commotion was caused among the mercantile population of Gibraltar in 1871 by a proposed customs ordinance, framed for the suppression of the smuggling. One of its chief provisions was that no tobacco should be exported or imported in vessels of less than 100 tons burden, or in packets of less than 80 lb.

The population of Gibraltar in 1840 was 15,554, of whom 11,313 were British subjects and 4241 aliens; and by 1850 it had increased to 15,823, with 3641 aliens. In 1860 the civil population, including foreigners visiting the garrison, amounted to 17,647; but the number of resident inhabitants was only 15,467. According to returns for 1901 the total population of the town and fortress was 26,870, the aliens numbering 2241 and the military 6475. The death-rate of the civil population varies from 25 to 31 per thousand, but it is almost always exceeded by the birth-rate. During the five years 1871–1875 the average number of births per annum was 592·4, and of deaths 538·2. Besides the natives, who themselves are of various origin, there are always in the town considerable numbers of Spaniards, Portuguese, and Italians, as well as stray representatives of almost every nationality engaged in the trade of the Mediterranean. Though by the treaty of Utrecht it was specially bargained by Spain that "no leave shall be given under any pretence whatever either to Jews or Moors to reside or have their dwelling in the town of Gibraltar," the native Jews by 1844 numbered no fewer than 1385.

The greater part of the population is Roman Catholic, but full religious liberty is of course enjoyed. The church of the Holy Trinity was constituted to be a cathedral and bishop's see of the Church of England in 1843. The Wesleyans and the Presbyterians have places of worship. St. Andrew's, the new Presbyterian church, was built by the Free Church of Scotland in 1854. A proposal for concomitant endowment of "church bodies for the Anglican and Roman Catholic communities" with the annual sum of £500 was made by the governor in 1876, but it was not sanctioned by parliament. An annual grant to this amount is made to both bodies, but the Government no longer keeps the cathedral in repair. The Roman Catholic bishop of Antinoe is vicar apostolic of Gibraltar.

Gibraltar was long an ill-managed and expensive colony; but its expenditure is now sometimes even less than its revenue. During the five years from 1871 to 1875 the average expenditure, increased by several unusual items, was £43,988; and the average income was £42,464. For 1877 the expenditure was £41,585, or £1739 more than the income. The chief sources of the revenue are the port and quarantine dues, the excise on the consumption of wines and spirits, and the ground and house rents,—the three departments yielding respectively on the average from 1871 to 1875 £11,011, £11,512, and £6206. It is worthy of note that the ground and house rentals have increased from £5629 in 1871 to £7078 in 1875. Among the heavier items of outlay are the governor's salary, which amounts to £5000 per annum, and the judicial and ecclesiastical expenses, which were, on an average, from 1871 to 1875 respectively £3909 and £1061. The total cost of the mili-

tary establishment was, on the average of four years from 1869 to 1873, £315,454—of which £250,340 was the average cost of the regular troops, £1610 for the jails, and £19,293 for the barracks. The convict establishment was abolished in 1875. At that date it contained 238 prisoners, who were managed on the associated system; and grievous complaints were made of the difficulty of maintaining satisfactory discipline.

*History.*—Gibraltar was known to the Greek and Roman geographers as Calpe or Alybe, the two names being probably corruptions of the same local (perhaps Phœnician) word. The eminence on the African coast near Ceuta, which bears the modern English name of Apes' Hill, was then designated Abyla; and Calpe and Abyla, at least according to an ancient and widely current interpretation, formed the renowned Pillars of Hercules (Herculis columnæ, Ἡρακλέους στῆλαι) which for centuries were the limits of enterprise to the seafaring peoples of the Mediterranean world. The strategic importance of the rock appears to have been first discovered by the Moors, who, when they crossed over from Africa in the 8th century, selected it as the site of a fortress. From their leader Tarik ibn Zeyad it was called Gebel Tarik or Tarik's Hill; and, though the name had a competitor in Gebel al Futah or Hill of the Entrance, it gradually gained acceptance, and still remains sufficiently recognizable in the corrupted form of the present day. The first siege of the rock was in 1309, when it was taken by Alonzo Perez de Guzman for Ferdinand IV. of Spain, who, in order to attract inhabitants to the spot, offered an asylum to swindlers, thieves, and murderers, and promised to levy no taxes on the import or export of goods. The attack of Ismail ben Ferez in 1315 (2d siege) was frustrated; but in 1333 Vasco Paez de Meira, having allowed the fortifications and garrison to decay, was obliged to capitulate to Mahomet IV. (3d siege). Alphonso's attempts to recover possession (4th siege) were futile, though pertinacious and heroic, and he was obliged to content himself with a tribute for the rock from Abdul Melek of Granada; but after his successful attack on Algeciras in 1344 he was encouraged to try his fortune again at Gibraltar. In 1349 he invested the rock, but the siege (5th siege) was brought to an untimely close by his death from the plague in February, 1350. The next or 6th siege resulted simply in the transference of the coveted position from the hands of the king of Morocco to those of Yussef III. of Granada; and the 7th, undertaken by the Spanish count of Niebla, Enrico de Guzman, proved fatal to the besieger and his forces. In 1462, however, success attended the efforts of Alonzo de Arcos (8th siege), and in August the rock passed once more under Christian sway. The duke of Medina Sidonia, a powerful grandee who had assisted in its capture, was anxious to get possession of the fortress, and though Henry IV. at first managed to maintain the claims of the crown, the duke ultimately made good his ambition by force of arms (9th siege), and in 1469 the king was constrained to declare his son and his heirs perpetual governors of Gibraltar. In 1479 Ferdinand and Isabella made the second duke marquis of Gibraltar, and in 1492 the third duke Don Juan was reluctantly allowed to retain the fortress. At length in 1501 Garcilaso de la Vega was ordered to take possession of the place in the king's name, and it was formally incorporated with the domains of the crown. After Ferdinand and Isabella were both dead the duke Don Juan tried in 1506 to recover possession, and added a tenth to the list of sieges. Thirty-four years afterwards the garrison had to defend itself against a much more formidable attack (11th siege)—the pirates of Algiers having determined to recover the rock for Mahomet and themselves. The conflict was severe, but resulted in the repulse of the besiegers. After this the Spaniards made great efforts to strengthen the place, and they succeeded so well that throughout Europe Gibraltar was regarded as impregnable.

In the course of the War of the Spanish Succession, however, it was taken by a combined English and Dutch fleet under Sir George Rooke, assisted by a body of troops under Prince George of Hesse-Darmstadt. The captors had ostensibly fought in the interests of Charles archduke of Austria (afterwards Charles III.), but, though his sovereignty over the rock was proclaimed on July 24, 1704, Sir George Rooke on his own responsibility caused the English flag to be hoisted, and took possession in name of Queen Anne. It is hardly to the honor of England that it was both unprincipled enough to sanction and ratify the occupation, and ungrateful enough to leave unrewarded the general to whose unscrupulous patriotism the acquisition was due. The Spaniards keenly felt the injustice done to them, and the inhabitants of the town of Gibraltar in great numbers abandoned their homes rather than recognize the authority of the invaders. In October, 1704, the rock was invested by sea and land; but the Spanish ships were dispersed by Sir John Leake, and the marquis of Villadarias fared so ill with his forces that he was replaced by Marshal Tessé, who was at length compelled to raise the siege in April, 1705. During the next twenty years there were endless negotiations for the peaceful surrender of the fortress, and in 1726 the Spaniards again appealed to arms. But the Conde de la Torres, who had the chief command, succeeded no better than his predecessors, and the defence of the garrison under General Clayton and the earl of Portmore was so effective that the armistice of June 23d practically put a close to the siege, though two years elapsed before the general pacification ensued. The most memorable siege of Gibraltar, indeed one of the most memorable of all sieges, was that which it sustained from the combined land and sea forces of France and Spain during the years 1779–1783. The grand attack on the place was made on the 13th September, 1782, and all the resources of power and science were exhausted by the assailants in the fruitless attempt. On the side of the sea they brought to bear against the fortress forty-six sail of the line, and a countless fleet of gun and mortar boats. But their chief hope lay in the floating batteries planned by D'Arçon, an eminent French engineer, and built at the cost of half a million sterling. They were so constructed as to be impenetrable by the red-hot shot which it was foreseen the garrison would employ; and such hopes were entertained of their efficiency that they were styled invincible. The Count d'Artois (afterwards Charles X.) hastened from Paris to witness the capture of the place. He arrived in time to see the total destruction of the floating batteries, and a considerable portion of the combined fleet, by the English fire. Despite this disaster, however, the siege continued till brought to a close by the general pacification, February 2d, 1783. The history of the four eventful years' siege is fully detailed in the work of Drinkwater, who himself took part in the defence, and in the *Life* of its gallant defender Sir George Augustus Eliott, afterwards Lord Heathfield, whose military skill and moral courage place him among the best soldiers and noblest men whom Europe produced during the 18th century.

Since 1783 the history of Gibraltar has been comparatively uneventful. In the beginning of 1801 there were rumors of a Spanish and French attack, but the Spanish ships were defeated off Algeciras in June by Admiral Saumarez. Improvements in the fortifications, maintenance of military discipline, and legislation in regard to trade and smuggling are the principal matters of recent interest.

GIBSON, Edmund (1669–1748), bishop of London, the learned compiler of the *Codex Juris Ecclesiastici Anglicani*, was born at Bampton, in Westmoreland, in 1669. After a promising career at one of the local schools, he was in 1686 entered a scholar at Queen's College, Oxford, where, at the early age of twenty-two (1692), he distinguished himself by the publication of a valuable edition of the *Saxon Chronicle*, with a Latin translation, indices, and notes. This was followed in 1693 by an annotated edition of the *De Institutione Oratoria* of Quintilian, and in 1694 by a translation in two volumes folio of Camden's *Britannia*, "with additions and improvements," in the preparation of which he had been largely assisted by the volunteered aid of various English antiquaries. Shortly after Tenison's elevation to the see of Canterbury in 1694, Gibson was appointed chaplain and librarian to the archbishop, and at a somewhat later period he became rector of Lambeth and archdeacon of Surrey. In the discussions which arose during the reigns of William and Anne relative to the rights and privileges of the Convocation, Gibson took a very active part, and in a series of pamphlets warmly argued for the right of the archbishop to continue or prorogue that assembly. The controversy suggested to him the idea of those researches which resulted in the *Codex Juris Ecclesiastici Anglicani*, published in two vols. folio in 1713,—a work which discusses more learnedly and comprehensively than any other the legal rights and duties of the English clergy, and the constitution, canons, and articles of the English Church. In 1715 Gibson was presented to the see of Lincoln, whence he was in 1723 translated to that of London, where for twenty-five years he exercised an immense influence, being the authority chiefly consulted by the court on all ecclesiastical affairs. While a conservative in church politics, he yet respected the various forms of dissent, and discouraged all attempts to prevent dissenters from worshipping in the manner and according to the principles which they preferred. He exercised a vigilant oversight over the morals of all ranks and classes of the community committed to his charge; and his fear-

less denunciation of the licentious masquerades which had become highly popular at court finally lost him the royal favor. Among the literary efforts of his later years the principal were a series of *Pastoral Letters* in defence of the "gospel revelation," against "lukewarmness" and "enthusiasm," and on various topics of the day; also the *Preservative against Popery*, in 3 vols. folio (1738), a compilation of numerous controversial writings of eminent Church of England divines, dating chiefly from the period of James II. Gibson died on the 6th September, 1748.

A second edition of the *Codex Juris*, "revised and improved, with large additions by the author," was published at Oxford in 1761. Besides the works already mentioned, Gibson published a number of *Sermons*, and other works of a religious and devotional kind. The *Vita Thomæ Bodleii* with the *Historia Bibliothecæ Bodleianæ* in the *Catalogi librorum manuscriptorum* (Oxford, 1697), and the *Reliquiæ Spelmannianæ* (Oxford, 1698), are also from his pen.

GIBSON, John (1790–1866), sculptor, was born near Conway, in 1790, in very humble circumstances, his father being a market gardener. He is a notable example of one who, with no so-called start in life, carved his way to distinction by the force of a steady purpose and strong will. To his mother, whom he described as ruling his father and all the family, he owed, like many other great men, the energy and determination which carried him over every obstacle. He narrowly escaped emigration to America, the first step towards which took the family to Liverpool, where his mother's will interposed to keep them. He was then nine years of age, and was sent to school. The windows of the print shops of Liverpool riveted his attention; and, having no means to purchase the commonest print, he acquired the habit of committing to ocular memory the outline of one figure after another, drawing it on his return home. Thus early did he form the system of observing, remembering, and noting, sometimes even a month later, scenes and momentary actions from nature—a habit peculiar in that degree to himself, but of the utmost importance to all artists to practise. In this way he, by degrees, transferred from the shop window to his paper at home the chief figures from David's picture of Napoleon crossing the Alps, which, by particular request, he copied in bright colors as a frontispiece to a little schoolfellow's new prayer-book, for sixpence. At fourteen years of age Gibson was apprenticed to a firm of cabinetmakers,—portrait and miniature painters in Liverpool requiring a premium which his father could not give. This employment so disgusted him that after a year (being interesting and engaging then apparently as in after life) he persuaded his masters to change his indentures, and bind him to the wood-carving with which their furniture was ornamented. This satisfied him for another year, when an introduction to the foreman of some marble works, and the sight of a small head of Bacchus, unsettled him again. He had here caught a glimpse of his true vocation, and in his leisure hours began to model with such success that his efforts found their way to the notice of Mr. Francis, the proprietor of the marble works. The wood-carving now, in turn, became his aversion; and having in vain entreated his masters to set him free, he instituted a strike. He was every day duly at his post, but did no work. Threats, and even a blow, moved him not. At length the offer of £70 from Francis for the rebellious apprentice was accepted, and Gibson found himself at last bound to a master for the art of sculpture. Francis paid the lad 6s. a week, and received good prices for his works,—sundry early works by the youthful sculptor, which exist in Liverpool and the neighborhood, going by the name of Francis to this day. It was while thus apprenticed that Gibson attracted the notice of Mr. Roscoe, whose taste in Greek art seems to have been superior to his judgment in Italian history. For him Gibson executed a basso rilievo in terra cotta, now in the Liverpool Museum. Roscoe opened to the sculptor the treasures of his library at Allerton, by which he became acquainted with the designs of the great Italian masters. A cartoon of the Fall of the Angels marked this period,—now also in the Liverpool Museum. We must pass over his studies in anatomy, pursued gratuitously by the kindness of a medical man, and his introductions to families of refinement and culture in Liverpool. Roscoe was an excellent guide to the young aspirant, pointing to the Greeks as the only examples for a sculptor. Gibson here found his true vocation. A basso rilievo of Psyche carried by the Zephyrs was the result. He sent it to the Royal Academy, where Flaxman, recognizing its merits, gave it an excellent place. Again he became unsettled. The ardent young breast panted for "the great university of Art"—Rome; and the first step to the desired goal was to London. Here he stood between the opposite advice and influence of Flaxman and Chantrey—the one urging him to Rome as the highest school of sculpture in the world, the other maintaining that London could do as much for him. It is not difficult to guess which was Gibson's choice. He arrived in Rome in October, 1817, at a comparatively late age for a first visit. There he immediately experienced the charm and goodness of the true Italian character in the person of Canova, to whom he had introductions,—the Venetian putting not only his experience in art but his purse at the English student's service. Up to this time, though his designs show a fire and power of imagination in which no teaching is missed, Gibson had had no instruction, and had studied at no Academy. In Rome he first became acquainted with rules and technicalities, in which the merest tyro was before him. Canova introduced him into the Academy supported by Austria, and, as is natural with a mind like Gibson's, the first sense of his deficiencies in common matters of practice was depressing to him. He saw Italian youths already excelling, as they all do, in the drawing of the figure. But the tables were soon turned. His first work in marble—a Sleeping Shepherd modelled from a beautiful Italian boy—has qualities of the highest order. Gibson was soon launched, and distinguished patrons, first sent by Canova, made their way to his studio in the Via Fontanella. His aim, from the first day that he felt the power of the antique, was purity of character and beauty of form. He very seldom declined into the prettiness of Canova, and if he did not often approach the masculine strength which redeems the faults of Thorwaldsen, he more than once surpassed him even in that quality. We allude specially to his Hunter and Dog, and to the grand promise of his Theseus and Robber, which take rank as the highest productions of modern sculpture. He was essentially classic in feeling and aim, but here the habit of observation we have mentioned enabled him to snatch a grace beyond the reach of a mere imitator. His subjects were gleaned from the free actions of the splendid Italian people noticed in his walks, and afterwards baptized with such mythological names as best fitted them. Thus a girl kissing a child, with a sudden wring of the figure, over her shoulder, became a Nymph and Cupid; a woman helping her child with his foot on her hand on to her lap, a Bacchante and Faun; his Amazon thrown from her Horse, one of his most original productions, was taken from an accident he witnessed to a female rider in a circus; and the Hunter holding in his Dog was also the result of a street scene. The prominence he gave among his favorite subjects to the little god "of soft tribulations" was no less owing to his facilities for observing the all but naked Italian children, in the hot summers he spent in Rome.

In monumental and portrait statues for public places, necessarily represented in postures of dignity and repose, Gibson was very happy. His largest effort of this class—the group of Queen Victoria supported by Justice and Clemency, in the palace of Westminster—we agree with himself in pronouncing his finest work in the round. Of noble character also in execution and expression of thought is the statue of Mr. Huskisson with the bared arm; and no less, in effect of aristocratic ease and refinement, the seated figure of Dudley North. He lays down the axiom in his journal that the Greeks represented "men thinking, and women tranquil," and to the departure from this rule we attribute the unattractive colossal statue of Sir Robert Peel in Westminster Abbey. The very animation he has given to the head is too individual to harmonize with the classic drapery, or with the real character of the man. The great statesman is here colloquial rather than eloquent in expression, while the position of the right foot suggests the idea of a walking figure. Great as he was in the round, Gibson's chief excellence lay in basso rilievo, and in this less disputed sphere he obtained his greatest triumphs. His thorough knowledge of the horse, and his constant study of the Elgin marbles—casts of which are in Rome—resulted in the two matchless bassi rilievi, the size of life, which belong to the earl of Fitzwilliam—the Hours leading the Horses of the Sun, and Phaethon driving the Chariot of the Sun. Most of his monumental works are also in basso

rilievo. Some of these are of a truly refined and pathetic character, such as the monument to the countess of Leicester, that to his friend Mrs. Huskisson in Chichester Cathedral, and that of the Bonomi children. In reviewing the qualities most characteristic of this great artist, that of passionate expression may be said to stand foremost. Passion, either indulged or repressed, was the natural impulse of his art:—repressed as in the Hours leading the Horses of the Sun, and as in the Hunter and Dog; indulged, as scarcely before seen in the same intensity in the whole range of sculpture, as in the meeting of Hero and Leander, a drawing executed before he left England. Gibson's power of drawing may be pronounced to have been unsurpassed by any modern. He had an iron hand, and used the pen in rapid action with as much certainty as if it had been the graver. Nowhere is the fire of his genius so unmistakably seen as in these first-hand productions. Nor can we wonder that marble, however highly wrought, could never entirely compensate for what was necessarily lost in the translation. Gibson was the first to introduce color on his statues,—first, as a mere border to the drapery of a portrait statue of the Queen, and by degrees extended to the entire flesh, as in his Venus, and in the Cupid tormenting the Soul, belonging to Mr. Holford. In both of these it amounts to no more than the slightest tint. Gibson's individuality was too strongly marked to be affected by any outward circumstances. In all worldly affairs and business of daily life he was simple and guileless in the extreme; but he was resolute in matters of principle, determined to walk straight at any cost of personal advantage. Unlike most artists, he was neither nervous nor irritable in temperament. It was said of him that he made the heathen mythology his religion; and indeed in serenity of nature, feeling for the beautiful, and a certain philosophy of mind, he may be accepted as a type of what a pure-minded Greek pagan, in the zenith of Greek art, may have been. Gibson was elected R. A. in 1836, and bequeathed all his property and the contents of his studio to the Royal Academy, where his marbles and casts are open to the public. He died at Rome, in January, 1866.

The letters between Gibson and Mrs. Henry Sandbach, granddaughter of Mr. Roscoe, and a sketch of his life that lady induced him to write, furnish the chief materials for his biography. A volume of engravings from his finished works renders them very indifferent justice. A volume of facsimiles from his drawings is more worthy of him. (E. E.)

GICHTEL, Johann Georg (1638–1710), founder of the mystic sect of Gichtelians or Angelic Brethren, was born at Ratisbon, where his father was a member of senate, on the 14th of March, 1638. Having acquired at school, besides an ordinary elementary education, a considerable acquaintance with Greek, Hebrew, Syriac, and even Arabic, he proceeded to Strasburg to study divinity; but finding that the theological prelections of Schmidt and Spener there were not conducive to the growth of his piety, he removed to Spires, where he entered the faculty of law. In 1664 he was admitted an advocate at Ratisbon; but having become acquainted with the Baron von Weltz, an Hungarian nobleman who cherished enthusiastic if not extravagant schemes for the reunion of Christendom and the conversion of the world, he abandoned all interest in his profession, and became an energetic promoter of the "Christerbaulichc Jesusgesellschaft," or Christian Edification Society of Jesus, in the interests of which he visited many parts of Germany and Holland. The movement in its beginnings provoked at least no active hostility; but when Gichtel began to attack the teaching of the Lutheran clergy and church, especially upon the fundamental doctrine of justification by faith, he exposed himself to a prosecution which ultimately resulted in sentence of banishment and confiscation (1665). After many months of wandering and occasionally romantic adventure, he, in January, 1667, reached Holland, and settled at Zwoll, where he co-operated with Breckling, a man who shared his views and aspirations. Having become involved in the troubles of this friend, Gichtel, after a period of imprisonment, was banished for a term of years from Zwoll, but finally, in 1668, found a home in Amsterdam, where in a state of poverty (which, however, never became destitution), he lived out his strange life of visions and day-dreams, of prophecy and prayer. He became an ardent student and disciple of Jacob Boehme, whose works he published in 1682 (Amsterdam, 2 vols.); but before the time of his death, which occurred January 21, 1710, he had attracted to himself a small band of followers known as Gichtelians or Angelic Brethren, who propagated certain views at which he had arrived independently of Boehme. Seeking ever to hear the authoritative voice of God within them, and endeavoring to attain to a life altogether free from carnal desires, like that of "the angels in heaven, who neither marry nor are given in marriage," they claimed to exercise a priesthood "after the order of Melchizedek," appeasing the wrath of God, and ransoming the souls of the lost by sufferings endured vicariously after the example of Christ. The sect, never a numerous one, is said still to subsist in some districts of Holland and North Germany. Gichtel's correspondence was published without his knowledge by Gottfried Arnold, a disciple, in 1701 (2 vols.), and again in 1708 (3 vols.). It has been frequently reprinted under the title *Theosophia Practica*. The seventh volume of the Berlin edition (1768) contains a notice of Gichtel's life.

GIDEON, liberator, reformer, and "judge" of Israel, was the youngest son of Joash, of the "house" of Abiezer, and tribe of Manasseh, and had his home at Ophrah, the site of which is probably to be sought westward of Jordan, somewhat to the south of the plain of Jezreel. Gideon lived at a time when Israel, grown idolatrous, had been brought very low by periodic incursions of the "Midianites" and "Amalekites," nomad tribes from the east of Jordan, who in great numbers were wont to overrun the country, destroying all that they could not carry away. In the beginning of the narrative of his public life he is represented as an unambitious man, quietly engaged in agricultural pursuits, who yet had already distinguished himself as a "mighty man of valor," probably in guerilla warfare against the common foe. According to that narrative, his first exploit worthy of special commemoration was the destruction, by divine command, of the altar of Baal belonging to his father, and of the Ashera beside it, and the substitution of an altar to Jehovah. But immediately before this he had also been summoned by "the angel of the Lord" to undertake, in dependence on supernatural direction and help, the work of liberating his country from its long oppression, and, in token that he accepted the mission, had already erected in Ophrah an altar which he called "Jahveh-Shalom" (Jehovah is prosperity). The great gathering of the Midianites and their allies on the north side of the plain of Jezreel "stretching from the hill of Moreh;" the general muster first of Abiezer, then of all Manasseh, and lastly of the neighboring tribes of Asher, Zebulun, and Naphtali; the signs by which the wavering faith of Gideon was steadied; the methods by which an unwieldy mob was reduced to a small but trusty band of energetic and determined men; and the stratagem by which the vast army of Midian was surprised and routed by the handful of Israelites descending from "above Endor," are indicated with sufficient clearness in the Scripture narrative, and need not be detailed minutely here. There is some difficulty in following the account of the subsequent flight of the Midianites, which seems to have taken place in two directions,—Oreb and Zeeb making for the lower fords of Jordan, towards the south-east, while Zebah and Zalmunna took the upper passage, a little below the place where the river flows out of the Sea of Galilee. Leaving the Ephraimites (who had now risen in force) to deal with the former, Gideon with his 300 appears to have kept up the pursuit of the latter to Nobah and Jogbehah, points beyond Succoth and Penuel, where a bloody contest resulted in the destruction of that portion of the Midianite army, and in the ultimate capture and execution of Zebah and Zalmunna. Almost simultaneously with these occurrences eastward of Jordan, messengers from Ephraim bearing the heads of Oreb ("raven") and Zeeb ("wolf"), who with their followers had been crushed at "the raven's rock" and "the wolf's den" respectively, announced the completeness of Israel's victory. Having taken unrelenting vengeance on the men of Penuel and Succoth, who had shown a timid neutrality when the patriotic struggle was at its crisis, Gideon returned to his native Ophrah, where he further distinguished himself by his pious magnanimity in refusing the kingship which had been put within his reach—an act of self-denial, however, which, according to the sacred historian, was somewhat neutralized by his subsequent folly in establishing a shrine which proved a snare to all Israel, not excluding his family or even himself. For forty years after the great victory he lived at his own house in Ophrah in considerable wealth and magnificence, yet always in a private station—there being no direct scriptural

evidence at least that his judgeship lasted during all that period, or that it ever gave him any position of legally recognized authority. The name of Gideon occurs in Heb. xi. 32, in the list there given of those who became heroes by faith; but, except in Judges vi.–viii., it is not to be met with anywhere in the Old Testament. In 1 Sam. xii. 11 and 2 Sam. xi. 21 (LXX.) he is called Jerubbaal (the reading Jerubbesheth having been introduced into the latter passage in accordance with the usage explained in the article Baal). The fact that in Judges ix., which appears to be the oldest part of the narrative, he is invariably called Jerubbaal, has suggested to Kuenen and others that this ought to be regarded as his original and proper name, that of Gideon (גִּדְעוֹן, *i. e.* "hewer" or "warrior," *cf.* Isa. x. 33) having been a later designation. In confirmation of this it is pointed out that the derivation of ירבעל as equivalent to יָרֶב בּוֹ הַבַּעַל ("Let Baal contend against him," v. 32, or "Let Baal contend for himself," v. 31) is much less probable than that which interprets it as precisely analogous with such names as Merib-baal, Jehoiarib or Joarib, Seraiah, Israel, and perhaps also Josadec, all meaning "God fights" or "contends." The nature of the grounds on which it is conjectured that Gideon's conquest of the Midianites was somewhat slower than the narrative on a first reading would lead one to suppose, and that his religious reforms, far from being confined to a solitary act of his early manhood, were rather the principal employment of his later life, is indicated in the histories of Israel by Ewald, Hitzig, and Kuenen. See also especially Wellhausen, *Geschichte*, i. 252 *sq.*

GIEN, a town of France, at the head of an arrondissement in the department of Loiret, is situated on the right bank of the Loire, 39 miles E. S. E. of Orleans. The Loire is crossed at Gien by a stone bridge of twelve arches, built about the end of the 15th century. The town is the seat of a tribunal of the first instance and of a justice of peace court. The principal buildings are the prison, the hospital, the old castle, originally built by Charlemagne, and reconstructed in 1494 by Anne de Beaujeu, daughter of Louis XI., and the church of Saint Pierre, a modern structure of no particular merit, but possessing an old square tower dating from the end of the 15th century. There are manufactures of serge, leather, and earthenware, and some trade in corn and wine. The population in 1901 was 6,241.

GIESELER, Johann Karl Ludwig (1792–1854), one of the most distinguished of the modern school of scientific writers on church history, was born at Petershagen, near Minden, where his father, a man of considerable vigor and independence of character, was minister, on the 3d of March, 1792. In his tenth year he entered the orphanage at Halle, whence he duly passed to the university, his studies being interrupted, however, from October, 1813, till the peace of 1815, by a period of military service, during which he was enrolled as a volunteer in a regiment of chasseurs. Having in 1817 taken his degree in philosophy, he in the same year became assistant head master in the Minden gymnasium, and in 1818 was appointed conrector of the gymnasium at Cleves. Here he published his earliest work (*Historisch-kritischer Versuch über die Entstehung u. die frühesten Schicksale der schriftlichen Evangelien*), a treatise which has had considerable influence on all subsequent investigations and discussions of the question as to the origin of the Gospels, in so far as it may be considered to have finally disposed of that theory of a "primitive" written gospel to which most critics in the earlier part of the century had inclined. In 1819 Gieseler was appointed a professor ordinarius in theology in the newly-founded university of Bonn, where, besides lecturing on church history, he made important contributions to the literature of that subject in Rosenmüller's *Repertorium*, Stäudlin u. Tschirner's *Archiv*, and in various university "programs." The first part of the first volume of his well-known *Church History* appeared in 1824. In 1833 he accepted a call to Göttingen, where the remainder of his life was spent, marked by few noteworthy events beyond the steady publication of volume after volume of his contributions to historical science. In 1837 he was appointed a consistorialrath, and shortly afterwards was created a knight of the Guelphic order. In the winter of 1853–4 symptoms of failing health began to appear, and towards the end of the session he was able to lecture only occasionally. His death occurred on the 8th of July, 1854. The fourth and fifth volumes of the *Kirchengeschichte*, embracing the period subsequent to 1814, were published posthumously by Redepenning (1855); and they were followed in 1856 by a *Dogmengeschichte*, which is sometimes reckoned as the sixth volume of the *Church History*. Among church historians Gieseler continues to hold a very high place. Less vivid and picturesque in style than Hase, conspicuously deficient in Neander's deep and sympathetic insight into the more spiritual forces by which church life is always more or less pervaded, he excels these and all other contemporaries in the fulness and accuracy of his information. His *Lehrbuch der Kirchengeschichte*, in which, indeed, the text as compared with the notes often occupies a very subordinate place, is invaluable to the student who wishes at each step to be brought into direct contact with all the original sources of information which it is of importance that he should know. The work, which has passed through several editions in Germany, has partially appeared also in two English translations. That published in New York (*Text Book of Ecclesiastical History*, 4 vols.), brings the work down to the peace of Westphalia, while that published in "Clark's Theological Library" (*Compendium of Ecclesiastical History*, Edin., 5 vols.) closes with the beginning of the Reformation. For the life of Gieseler reference may be made to Redepenning's biographical sketch in the fifth volume of the *Kirchengeschichte*, and to Herzog's article in the *Real-Encyclopädie* (of which great work, it may be mentioned, Gieseler was an energetic promoter). Both biographers testify that with the habits of a devoted student he combined those of an energetic man of business. He frequently held the office of pro-rector of the university, and did much useful work as a member of several of its committees. He took a warm interest also in the Göttingen orphanage, where he was a daily visitor, knew all the children personally, and taught them to regard him as a counsellor and friend.

GIESSEN, a town of Germany, capital of the province of Upper Hesse, in the grand-duchy of Hesse-Darmstadt, is situated in a beautiful and fruitful valley at the confluence of the Wieseck with the Lahn, 33 miles N. N. W. of Frankfort. It is the seat of a bailiwick, a high court, and a district penal court. The old streets are narrow and irregular, but in the suburbs outside the old walls there are many elegant houses. Besides the university, the principal buildings are the provincial Government offices, comprising a portion of the old castle dating from the 12th century, the arsenal, the town-hall, the new gymnasium, and the town church. The university, founded in 1607 by the landgrave Louis V., has a large and valuable library, a botanic garden, an observatory, an anatomical theatre, an infirmary, a maternity hospital, a museum of natural history, and a chemical laboratory which was directed by Professor Liebig. The number of professors and teachers of the university in 1907 was 91, and of students 1,192. There is also a gymnasium and a real school. The industries include the manufacture of woollen and cotton cloth of various kinds, leather, candles, tobacco, and beer.

Giessen was formed in the 12th century out of the villages Selters, Aster, and Kroppach, for whose protection Count William of Gleiberg built the castle of Giessen. Through marriage the town came into the possession of the palgrave of Tübingen, who sold it in 1265 to the landgrave Henry of Hesse. It was surrounded with fortifications in 1530, which were demolished in 1547 by the emperor Charles V, but rebuilt in 1560. From 1807 they were gradually pulled down, and their site converted into promenades. The population of Giessen in 1905 was 28,769.

GIFFORD, William (1757–1826), publicist and man of letters, was born at Ashburton, Devon, in April, 1757. Having as a shoemaker's apprentice manifested a remarkable aptitude for intellectual pursuits, he was by the charity of friends enabled to complete a previously imperfect school education, and ultimately to proceed in his twenty-third year to Oxford, where he was appointed a Bible reader in Exeter College. Leaving the university shortly after graduation in 1782, he for some years acted as tutor to Lord Belgrave, whom he accompanied on two prolonged Continental tours. After having settled in London, he in 1794 published his first work, a satirical piece, after Persius, entitled the *Baviad*, successfully aimed at a numerous school of second-rate writers then popularly known as the Della Cruscans. A second satire of a similar description, the *Mæviad*, directed against the corruptions of the drama, appeared in 1795. About this time Gifford became acquainted with Canning, with whose help he in August, 1797, originated a weekly

newspaper of Conservative politics entitled the *Anti-Jacobin*, which, however, in the following year ceased to be published. An English version of Juvenal, on which he had been for many years engaged, appeared in 1802; to this an autobiographical notice of the translator was prefixed. Two years afterwards Gifford published an annotated edition of the plays of Massinger; and in 1809, when the *Quarterly Review* was projected, he was entrusted with the management of that publication. It is on all hands conceded that the success which attended the *Quarterly* from the outset was due in no small degree to the ability and tact with which Gifford discharged his editorial duties. His connection with the *Review* continued until within about two years of his death, which took place in London on the 31st of December, 1826. Besides numerous contributions to the *Quarterly* during the last fifteen years of his life, he wrote a metrical translation of Persius, which appeared in 1821. Gifford also edited the poems of Ben Jonson, Ford, and Shirley. His edition of the first of these appeared in 1816, those of the other two, posthumously, in 1827 and 1833. The *Autobiography* was republished in 1827.

GIFT generally means an alienation of property otherwise than for a consideration, although in law it is often used to signify alienation with or without consideration. The effect of a gratuitous gift only need be considered here. Formerly in English law property in land could be conveyed by one person to another by a verbal gift of the estate accompanied by delivery of possession. The Statute of Frauds required all such conveyances to be in writing, and a later statute (8 and 9 Vict. c. 106) requires them to be by deed. Personal property may be effectually transferred from one person to another by a simple verbal gift accompanied by delivery. If a A delivers a chattel to B, saying or signifying that he does so by way of gift, the property passes, and the chattel belongs to B. But unless the actual thing is bodily handed over to the donee, the mere verbal expression of the donor's desire or intention has no legal effect whatever. The persons are in the position of parties to an agreement which is void, as being without consideration. When the nature of the thing is such that it cannot be bodily handed over, it will be sufficient to put the donee in such a position as to enable him to deal with it as the owner. For example, when goods are in a warehouse, the delivery of the key will make a verbal gift of them effectual; but it seems that part delivery of goods which are capable of actual delivery will not validate a verbal gift of the part undelivered. So when goods are in the possession of a warehouseman, the handing over of a delivery order might, by special custom (but not otherwise it appears), be sufficient to pass the property in the goods, although delivery of a bill of lading for goods at sea is equivalent to an actual delivery of the goods themselves. A *donatio mortis causa* is a gift made by a person in contemplation of death, to take effect only in the event of his death. It is revocable so long as he lives. There must be actual or constructive delivery of the thing itself, and therefore it has been said that only chattels can be the proper subject of a *donatio mortis causa*, although policies of insurance, bills, notes, etc., have been allowed to pass by mere delivery as death-bed gifts. A *donatio mortis causa* is not an out-and-out gift, but is conditioned on death.

GIJON, a town and seaport of Spain, in the province of Oviedo or Asturias, on the coast of the Cantabrian Sea, about 13 miles E. of the Cabo de Peñas, and 2 miles E. of the Rio Aboño. The older part of the town, partly surrounded by its walls, occupies the upper slope of a peninsular headland, while the more modern portion extends to the beach. On the whole, it is a clean and flourishing place, with wide streets and good houses; but there are few buildings of individual note except the church of San Pedro of the 15th century, the town house, the mansion of the Marquis Revilla-Gigedo, and the Asturian Institute. The last, which was founded in 1797 by Jovellanos, has a fine library, and comprises classes for navigation, mathematics, Latin, French, and English. Besides the works in connection with the railways which run inland from Gijon to Micres del Camino and Sama on the Nalon, there is a large glass work, and iron foundry, and a tobacco factory which alone gives employment to upwards of 1400 females. An extensive trade is carried on in the export of coal, iron, jet, and hazel-nuts, and in the import of fish and colonial produce. The nuts amount to upwards of 1600 tons per annum, and a large proportion finds its way to the English market. Though the harbor is a mere roadstead between the small promontories of San Lorenzo and Torres, it is of considerable value on such a coast as that of Asturias, especially as it has a good bottom. A quay was constructed by means of a grant from Charles V. in 1552–4, and a new one by Pedro Menendez in 1766–8, and an extension was effected in 1859 at a cost of £65,000. The population of Gijon in 1900 was 57,514. During the summer there is a considerable influx of strangers.

Gijon is usually identified with the Gigia of the Romans, which, however, occupied the site, not of the present town, but of the adjoining suburb of Cima da Villa. Captured and strengthened by the Moors, who used the stones of the Roman city for their fortifications, it remained in their hands till after the battle of Canicas, when its governor Munuza surrendered to Pelayo. In 844 it held out against an attack by the Normans, and in the following centuries it gradually rose into importance. In the time of Philip II. it possessed good arsenals, and was able to undertake the repairs of the Invincible Armada. Jovellanos, the statesman and poet, and Coan Bormudez, a writer on art, were both natives of Gijon, and the former is buried in the church of San Andrea.

GILBART, John William (1794–1863), the author of a number of works on banking, was descended from a Cornish family, and was born in London, March 21, 1794. From 1813 to 1825 he was clerk in a London bank, after which he went to Birmingham. Shortly after his return to London in 1827 he was appointed manager of the Kilkenny branch of the Provincial Bank of Ireland, and in 1829 he was promoted to the Waterford branch. In 1834 he became manager of the London and Westminster Bank; and to his skill in developing the system of joint-stock banking it owed much of its success. On more than one occasion he rendered valuable services to the joint-stock banks by his evidence before committees of the House of Commons; and, on the renewal of the bank charter in 1844, he procured the insertion of a clause granting to joint-stock banks the power of suing by their public officer, and also the right of accepting bills at less than six months' date. In testimony of their obligations to him, the directors and shareholders of joint-stock banks presented him in 1846 with a handsome service of plate. In the same year he was elected a Fellow of the Royal Society. He retired on a pension from the management of the London and Westminster Bank, 1st January, 1860, and died in London, August 8, 1863. From an early period Gilbart took an active part in the Athenian Debating Society of London, and he was also connected with the Union Society, which numbered among its other eminent members J. S. Mill and Lord Macaulay. He also devoted much of his attention to the promotion of literary and scientific institutions among the middle and working classes.

The following are his principal works on banking, most of which have passed through more than one edition:—*Practical Treatise on Banking*, 1827; *The History and Principles of Banking*, 1834; *The History of Banking in America*, 1837; *Lectures on the History and Principles of Ancient Commerce*, 1847; *Logic for the Million*, 1851; and *Logic of Banking*, 1857.

GILBERT, Sir Humphrey (1539–1583), a celebrated English navigator, was born in 1539 in the county of Devon, second of the three sons of Otho Gilbert of Greenway. By his mother's side he was half-brother to Sir Walter Raleigh, who resembled him in many points of character, and whose early life was largely influenced and guided by his example. Educated first at Eton and then at Oxford, he was destined by his father for the law; but being introduced at court by Raleigh's aunt, Catherine Ashley, he obtained the special favor of the queen, and was thus enabled to follow his natural inclination for active enterprise. Recommended by royal letter to Sir Philip Sidney, he received from him an appointment in the army in Ireland; and his services contributed so powerfully to put down the rebellion raging there that in 1570 he was made a knight and rewarded with the government of Munster. He next served for about five years in the Netherlands, being the first English colonel entrusted with command of English forces in that country. On his return to his native land he wrote a remarkable treatise on a subject at that time before the minds of men, the possibility of a north-west passage to India; and in 1576 it was published without his knowledge by George Gascoigne as *Discourse of a Discoverie for a New Passage to Cataia* (London, Henry Middleton for Richarde Ihones). The theory in question

was supported with no small force of argument, and the discourse was probably not without its influence in leading Frobisher to set out on his first voyage to the frozen north. In June, 1578, Gilbert received letters patent authorizing himself, his heirs and assigns, to discover, occupy, and possess such remote "heathen lands not actually possessed of any Christian prince or people, as should seem good to him or them." Disposing not only of his patrimony but also of the estates in Kent which he had through his wife, daughter of John Aucher of Ollerden, he strenuously prepared to put his permission to use, and his brother Raleigh joined him in the enterprise. By the end of the summer of 1578 a fleet of 11 sail, with 400 mariners and men-at-arms, was collected off the coast of Devon; but the gallant projectors were singularly unfortunate in the character of some of their associates. Dissensions broke out among the captains and disorder among the crews. Knollys, for example, boasted that, as kinsman to royalty, he was of more value than twenty knights, and insolently rejected Gilbert's invitation to dinner; and his men, encouraged by their captain's conduct, filled the town of Plymouth with uproar and riot, which finally culminated in murder. It was not till the 19th of November that Gilbert set sail, with his forces reduced to 7 ships and 150 men. The history of the voyage is involved in obscurity; but about the beginning of summer or a little earlier in 1579, the fleet returned to England, with little, it would appear, to report except that it had lost one of its chief ships and one of its bravest captains, Miles Morgan, in an encounter with the Spaniards. Gilbert lent his three ships to the Government for service against the Spaniards on the Irish coast; but in July 11, 1582, we still find him complaining to Walsingham that he had not received the moneys that were due to him, and that thus he was prevented from doing more for his queen and country. He was already planning a new expedition; and at length in 1583 his fleet was got together. The queen, though she had at first dissuaded Gilbert from his purpose, and would not permit Raleigh to accompany him, wrote to him by his brother's hand that she wished him "as great good hap and safety to his ship as if herself were there in person," and sent him as a token a golden figure of an anchor guarded by a lady. On 11th of June he departed from Plymouth with 5 sail; but on the 13th the "Ark Raleigh," which had been built and manned at his brother's expense, "ran from him in fair and clear weather having a large wind." This desertion was a cause of no small displeasure to the admiral, and he wrote to Sir George Peckham to solicit his brother to make the crew an example to all knaves; but it appears not improbable (according to Hayes in Hakluyt's collection) that the reason of their conduct was the breaking out of a contagious sickness in the ship. On the 5th of August Gilbert landed in Newfoundland, and took formal possession of it in the queen's name; but proceeding southwards with three vessels, he lost the largest near Cape Breton, and was at last constrained to return homewards with the "Golden Hind" and the "Squirrel" as the only remnant of his fleet. "On Monday the 9th September," reports Hayes, the captain of the "Hind," "the frigate was near cast away, yet at that time recovered; and giving forth signs of joy, the general, sitting abaft with a book in his hand, cried out unto us in the 'Hind,' 'We are as near to heaven by sea as by land.' The same Monday night the frigate's lights were suddenly out, and it was devoured and swallowed up by the sea." So perished Sir Humphrey Gilbert.

See Hakluyt's *Collection*, vol. iii.; Hooker's *Supplement* to Hollinshed's *Irish Chronicle*; Roger Williams, *The Actions of the Low Countries*, 1618; Bliss's edition of Wood's *Athenæ Oxonienses*, vol. i. p. 493; *North British Review*, No. 45; and the Lives of Sir W. Raleigh by Tytler, James Augustus St. John, and Edward Edwards.

GILBERT, Nicolas Joseph Laurent (1751–1780), a French poet, was born at Fontenay-le-Château in Lorraine, in 1751. Having completed his education at the college of Dôle, he devoted himself for a time to a half scholastic half literary life at Nancy, but at length in 1774 he found his way to the capital. As he had already assumed a hostile and satirical position towards the Encyclopedists, he naturally received a warmer welcome from the conservative party; and as he did not disdain to prostitute his muse to the celebration of the heroic and royal virtues of the despicable Louis XV., he was rewarded with pensions to a considerable amount. He died in October, 1780, from the results of a fall from his horse. The satiric force of one or two of his pieces, as *Mon apologie* (1778), and *Le dix-huitième siècle* (1775), would alone be sufficient to preserve his reputation, and it has been further increased by the eulogies of those modern writers who, like Alfred de Vigny, consider him a victim to the spite of his philosophic opponents.

Among his other works may be mentioned *Les Familles de Darius et d'Éridame, histoire persane* (1770), *Le Carnaval des Auteurs* (1773), *Odes nouvelles et patriotiques* (1775). Gilbert's *Œuvres complètes* were first published in 1778, and they have since been edited by Mastrella (Paris, 1823) and by Charles Nodier (1840, 1859, etc.).

GILBERT, or Gilberd, William (*c.* 1540–1603), was the most distinguished man of science in England during the reign of Queen Elizabeth. He was born at Colchester, where his father was recorder, but was a descendant of an ancient Suffolk family, long resident at Clare. Of his early years no account is left. He entered St. John's College, Cambridge, in 1558, when eighteen years of age, and in due course took the degrees of B.A., M.A., and M.D.; he also became Symson fellow, and in 1569 was elected a senior fellow of his college. After leaving the university he went to the Continent, and, on his return in 1573, settled in London, where for thirty years,—that is, till his death,—he practised as a physician with "great success and applause." He was admitted to the College of Physicians, and filled various offices in it. He began in 1581 as censor, which duty he discharged for several years; then he became treasurer, consiliarius elect, and, at last, president in 1600. His professional skill and general ability drew the attention of Queen Elizabeth to him, and she appointed him royal physician. She also settled a pension on him to enable him to prosecute the scientific inquiries to which he was devoted. After this Gilbert seems to have removed to the court, and to have vacated his house, which was "on St. Peter's Hill, between Upper Thames Street and Little Knight-Rider Street." At this house he seems to have had a society or college, which was broken up and the members dispersed by his promotion. In the year 1600 he published his work on the magnet. In 1603 the queen died, but Gilbert was reappointed by her successor. He did not long enjoy the honor, however, for he died November 30, 1603, some say at Colchester, others at London. He was buried at Colchester, in the chancel of the church of the Holy Trinity, where a monument was erected to him. To the College of Physicians he bequeathed his books, instruments, and minerals, but he gave his portrait to the School Gallery at Oxford. In it he is represented as tall of stature and of cheerful countenance, "holding in his hand a globe inscribed 'Terella;' over his head is the inscription '1591, ætatis 48;' and a little below his left shoulder, 'Magneticarum virtutum primus indagator Gilbertus.'" The date thus given does not tally with the conclusion of the inscription on his tombstone: "Obiit anno Redemptionis Humanæ 1603, Novembris ultimo, ætatis suæ 63." If the latter be correct, he was born in 1540; if the former, in 1543.

Gilbert's principal work is his treatise on magnetism, entitled *De Magnete, Magneticisque Corporibus, et de Magno Magnete Tellure*, London, 1600 (later editions—Sedan, 1628, 1633; Frankfort, 1629, 1638). The merit of this work consists in its originality, containing, as it does, an account of the author's experiments on magnets and magnetical bodies, and also the great discovery that the whole earth is nothing but a large magnet, and that it is this which explains, not only the direction of the magnetic needle north and south, but also the variation and dipping or inclination of the needle. Gilbert's is therefore, not merely the first, but the most important systematic contribution to the science of magnetism, and its merits were freely acknowledged by his contemporaries. A posthumous work of Gilbert's was edited by his brother, also called William, from two MSS. in the possession of Sir William Boswell; its title is *De Mundo Nostro Sublunari Philosophia Nova* (Amsterdam, 1651). He is the reputed inventor, besides, of two instruments to enable sailors "to find out the latitude without seeing of sun, moon, or stars." An account of these instruments is given in Thomas Blondeville's *Theoriques of the Planets* (London, 1602). The only writing of Gilbert in English is a short epistle addressed to William Barlowe, printed at the end of his little work entitled *Magneticall Advertisements* (London, 1616),—a letter which has hitherto escaped the notice of all the writers about Gilbert. It is of interest both because it shows that he carried on a scientific correspondence with the Continent, and that his book had been very well received, and because he says that he was intending to add six or eight sheets to the book,—an intention, however, which was never carried into effect.

The letter is dated 14th February, unfortunately without the year, but it must have been written between 1600 and 1603. In his preface Barlowe says that he had numerous letters from Gilbert, but these have long since disappeared. It is a matter of great regret for the historian of chemistry that Gilbert left nothing on that branch of science, to which he was deeply devoted, "attaining to great exactness therein." So at least says Fuller, who, in his *Worthies of England* (among whom he includes Gilbert), prophesied truly how he would be afterwards known: "Mahomet's tomb at Mecha," he says, "is said strangely to hang up, attracted by some invisible loadstone; but the memory of this doctor will never fall to the ground, which his incomparable book *De Magnete* will support to eternity."

GILBERT DE LA PORRÉE (*Gilbertus Porretanus* or *Pictaviensis*), an eminent scholastic logician and theologian of the 12th century, was born at Poitiers. He was educated under Bernard de Chartres and Anselm of Laon, and after completing his studies remained attached as teacher to the church at Chartres. In 1135 he is recorded as discharging these functions, but he seems soon after to have repaired to Paris and opened public courses on dialectics and theology. His fame caused him to be called to his native town, where in 1141 he was elected bishop. The heterodox opinions he was led to express regarding the doctrine of the Trinity drew upon his works the condemnation of the church. The synod of Rheims in 1148 procured papal sanction for four propositions opposed to certain tenets of Gilbert's, and the works of the latter were condemned until they should be corrected in accordance with the principles of the church. Gilbert seems to have submitted quietly to this judgment; he yielded assent to the four propositions, and remained on friendly terms with his antagonists till his death in 1154. Gilbert is almost the solitary logician of the 12th century who is quoted by the greater scholastics of the succeeding age. His chief logical work, the treatise *De Sex Principiis*, was regarded with a reverence almost equal to that given to Aristotle, and furnished matter for numerous commentaries. Albertus Magnus did not disdain to comment upon this work of an earlier logician. The treatise itself is an elaborate discussion of the Aristotelian categories, specially of the six subordinate modes. Gilbert distinguishes in the ten categories two classes, one essential, the other derivative. Essential or inhering (*formæ inhærentes*) in the objects themselves are only *substance*, *quantity*, *quality*, and *relation* in the stricter sense of that term. The remaining six, *when*, *where*, *action*, *passion*, *position*, and *habit*, are relative and subordinate (*formæ assistentes*). This suggestion has some interest, but it cannot be said to have great value, either in logic or in the theory of knowledge. More important in the history of scholasticism are the theological consequences to which Gilbert's realism led him. In the commentary on the treatise *De Trinitate*, erroneously supposed to be by Boetius, he proceeds from the metaphysical notion that pure or abstract being is prior in nature to that which is. This pure being is God, and must be distinguished from the triune God as known to us. God is incomprehensible, and the categories cannot be applied to determine his existence. In God there is no distinction or difference, whereas in all substances or things there is duality, arising from the element of matter. Between pure being and substances stand the ideas or forms, which subsist though they are not substances. These forms, when materialized, are called *formæ substantiales* or *formæ nativæ;* they are the essences of things, and in themselves have no relation to the accidents of things. Things are temporal, the ideas perpetual, God eternal. The pure form of existence, that by which God is God, must be distinguished from the three persons who are God by participation in this form. The form or essence is one, the persons or substances three. It was this distinction between Deitas or Divinitas and Deus that led to the condemnation of Gilbert's doctrine.

See Ritter, *Gesch. d. Phil.*, vii. 437–74: Hauréau, *Phil. Scolastique*, 2d ed., i. 447–78; Stöckl, *Phil. d. Mittelalters*, i. 272–88.

GILBERT OF SEMPRINGHAM, ST. (*c.* 1083–1189), founder of the order of Gilbertines (Ordo Gilbertinorum Canonicorum, Ordo Sempringensis), was born about the year 1083, at Sempringham, Lincolnshire, where his father, Jocelyn de Sempringham, a Norman noble who had taken part in the Conquest, had settled. On the completion of a liberal education, received partly in England and partly in France, Gilbert was ordained a priest in 1123, having been presented by his father to the united livings of Sempringham and Tirington. About 1135 he established in the immediate vicinity of his parish church a religious house for the reception of some destitute girls; the rule he prescribed was substantially that of St. Benedict, but the restrictions laid upon the communication of the inmates with the outer world were unusually severe. Subsequently the laborers who tilled the lands with which this establishment had been endowed were also formed into a religious community, under a rule resembling that of the Austin Friars, their house being placed close beside that of the nuns. Similar institutions elsewhere were encouraged by various English proprietors, and placed under the superintendence of Gilbert, who at last made application to Pope Eugenius III. to have them all merged in the Cistercian order (1148). This request, however, was refused, and Gilbert continued to act as superior of the monasteries he had founded for many years; although at the time of his death, on the 3d of February, 1189, that dignity was held by Roger, one of his disciples. In 1189 the Gilbertines are said to have possessed thirteen monasteries, with almshouses, hospitals, and orphanages attached; and the community numbered in all upwards of 700 male and 1100 female members. At the time of their suppression the total number of Gilbertine houses in England and Wales had increased to about twenty-five. Gilbert, who had sided and suffered with the church in the quarrels between Henry II. and Thomas à Becket, was canonized by Innocent III. in 1202, and his name is commemorated in the martyrologies on the 4th of February. The *Gilbertinorum Statuta* and a series of *Exhortationes ad Fratres* are attributed to him (see the Bollandist *Acta Sanctorum*, Feb. 4).

GILBERT ISLANDS. See POLYNESIA.

GILDAS, or GILDUS (*c.* 516–570), the earliest of British historians, surnamed by some Sapiens, and by others Badonicus, seems to have been born in the year 516. Regarding him little certain is known, beyond some isolated particulars that may be gathered from hints dropped in the course of his work. Two short treatises exist, purporting to be lives of Gildas, and ascribed respectively to the 11th and 12th centuries; but the writers of both are believed to have confounded two, if not more, persons that had borne the name. It is from an incidental remark of his own, namely, that the year of the siege of Mount Badon—one of the battles fought between the Saxons and the Britons—was also the year of his own nativity, that the date of his birth has been derived; the place, however, is not mentioned. His assertion that he was moved to undertake his task mainly by "zeal for God's house and for his holy law," and the very free use he has made of quotations from the Bible, leave scarcely a doubt that he was an ecclesiastic of some order or other. In addition, we learn that he went abroad, probably to France, in his thirty-fourth year, where, after 10 years of hesitation and preparation, he composed, about 560, the work bearing his name. His materials, he tells us, were collected from foreign rather than native sources, the latter of which had been put beyond his reach by circumstances. The *Cambrian Annals* give 570 as the year of his death.

The writings of Gildas have come down to us under the title of *Gildæ Sapientis de Excidio Britanniæ Liber Querulus*. Though at first written consecutively, the work is now usually divided into three portions,—a preface, the history proper, and an epistle,—the last, which is largely made up of passages and texts of Scripture brought together for the purpose of condemning the vices of his countrymen and their rulers, being the least important, though by far the longest of the three. In the second he passes in brief review the history of Britain from its invasion by the Romans till his own times. Among other matters reference is made to the introduction of Christianity in the reign of Tiberius; the persecution under Diocletian; the spread of the Arian heresy; the election of Maximus as emperor by the legions in Britain, and his subsequent death at Aquileia; the incursions of the Picts and Scots into the southern part of the island; the temporary assistance rendered to the harassed Britons by the Romans; the final abandonment of the island by the latter; the coming of the Saxons and their reception by Guortigern (Vortigern); and, finally, the conflicts between the Britons, led by a noble Roman, Ambrosius Aurelianus, and the new invaders. Unfortunately, on almost every point on which he touches, the statements of Gildas are vague and obscure. With one exception, already alluded to, no dates are given, and events are not always taken up in the order of their occurrence. These faults are of less

importance during the period when Greek and Roman writers notice the affairs of Britain; but they become more serious when, as is the case from nearly the beginning of the 5th century to the date of his death, Gildas's brief narrative is our only authority for most of what passes current as the history of our island during those years. Thus it is on his sole, though in this instance perhaps trustworthy, testimony that the famous letter rests, said to have been sent to Rome in 446 by the despairing Britons, commencing:—"To Agitius (Aetius), consul for the third time, the groans of the Britons."

Gildas's treatise was first published in 1525 by Polydore Vergil, but with many avowed alterations and omissions. Forty-three years later, Josseline, secretary to Archbishop Parker, issued a new edition of it more in conformity with manuscript authority; and in 1691 a still more carefully revised edition appeared at Oxford by Thomas Gale. It was frequently reprinted on the Continent during the 16th century, and once or twice since. The next English edition was that published by the English Historical Society in 1838, and edited by the Rev. J. Stevenson. Lastly, the text of Gildas, with elaborate introductions and the various readings of existing manuscripts, is included in the *Monumenta Historica Britannica*, edited by Petrie and Sharpe, London, 1848.

GILDING, the art of spreading or covering gold, either by mechanical or by chemical means, over the surface of a body for the purpose of ornament. The art of gilding was not unknown among the ancients. According to Herodotus, the Egyptians were accustomed to gild wood and metals; and gilding by means of gold plates is frequently mentioned in the books of the Old Testament. Pliny informs us that the first gilding seen at Rome was after the destruction of Carthage, under the censorship of Lucius Mummius, when the Romans began to gild the ceilings of their temples and palaces, the Capitol being the first place on which this enrichment was bestowed. But he adds that luxury advanced on them so rapidly that in a little time you might see all, even private and poor persons, gild the walls, vaults, and other parts of their dwellings. Owing to the comparative thickness of the gold-leaf used in ancient gilding, the traces of it which yet remain are remarkably brilliant and solid. Gilding has in all times occupied an important place in the ornamental arts of Oriental countries; and the native processes pursued in India at the present day may be taken as typical of the art as practised from the earliest periods. For the gilding of copper, employed in the decoration of temple domes and other large works, the following is an outline of the processes employed. The metal surface is thoroughly scraped, cleaned, and polished, and next heated in a fire sufficiently to remove any traces of grease or other impurity which may remain from the operation of polishing. It is then dipped in an acid solution prepared from dried unripe apricots, and rubbed with pumice or brick powder. Next the surface is rubbed over with mercury which forms a superficial amalgam with the copper, after which it is left some hours in clean water, again washed with the acid solution, and dried. It is now ready for receiving the gold, which is laid on in leaf, and, on adhering, assumes a grey appearance from combining with the mercury, but on the application of heat the latter metal volatilizes, leaving the gold a dull greyish hue. The color is brought up by means of rubbing with agate burnishers. The weight of mercury used in this process is double that of the gold laid on, and the thickness of the gilding is regulated by the circumstances or necessities of the case. For the gilding of iron or steel, the surface is first scratched over with chequered lines, then washed in a hot solution of green apricots, dried, and heated just short of red-heat. The gold leaf is then laid on, and rubbed in with agate burnishers, when it adheres by catching into the prepared scratched surface.

Modern gilding is applied to numerous and diverse surfaces and by various distinct processes, so that the art is prosecuted in many ways, and is part of widely different ornamental and useful arts. It forms an important and essential part of frame-making (see CARVING AND GILDING); it is largely employed in connection with cabinet-work, decorative painting, and house ornamentation; and it also bulks largely in bookbinding and ornamental leather work. Further, gilding is much employed for coating baser metals, as in button-making, in the gilt toy trade, in electro-gilt reproductions, and in electro-plating; and it is also a characteristic feature in the decoration of pottery, porcelain, and glass. As details of the processes employed in connection with these various substances will be found in the parts of this work where the technical processes to which they are related are described, it is only necessary here to indicate how the processes of gilding differ from each other.

The various processes fall under one or other of two heads —mechanical gilding and gilding by chemical agency.

MECHANICAL GILDING embraces all the operations by which gold-leaf is prepared (see GOLD-BEATING), and the several processes by which it is mechanically attached to the surfaces it is intended to cover. It thus embraces the burnish or water-gilding and the oil-gilding of the carver and gilder, and the gilding operations of the house decorator, the sign-painter, the bookbinder, the paper-stainer, and several others. Polished iron, steel, and other metals are gilt mechanically by applying gold-leaf to the metallic surface at a temperature just under red-heat, pressing the leaf on with a burnisher, and reheating, when additional leaf may be laid on. The process is completed by cold burnishing.

CHEMICAL GILDING embraces those processes in which the gold used is at some stage in a state of chemical combination. Of these the following are the principal:—

*Cold gilding.*—In this process the gold is obtained in a state of extremely fine division from a chemical compound, and applied by mechanical means. Cold gilding on silver is performed by a solution of gold in aqua-regia, applied by dipping a linen rag into the solution, burning it, and rubbing the black and heavy ashes on the silver with the finger or a piece of leather or cork. *Wet gilding* is effected by means of a solution of gold in ether, obtained by treating a dilute solution of chloride of gold with twice its quantity of ether. The liquids are agitated and allowed to rest, when the ether separates and floats on the surface of the acid. The whole mixture is then poured into a funnel with a small aperture, and allowed to rest for some time, when the acid is run off and the ether separated. The ether will be found to have taken up all the gold from the acid, and may be used for gilding iron or steel, for which purpose the metal is polished with the finest emery and spirits of wine. The ether is then applied with a small brush, and as it evaporates it deposits the gold, which can now be heated and polished. For small delicate figures a pen or a fine brush may be used for laying on the ether solution. *Fire-gilding* or *Wash-gilding* is a process by which an amalgam of gold is applied to metallic surfaces, the mercury being subsequently volatilized, leaving a film of gold or, according to Struve, an amalgam containing from 13 to 16 per cent. of mercury. In the preparation of the amalgam the gold must first be reduced to thin plates or grains, which are heated red hot, and thrown into mercury previously heated, till it begins to smoke. Upon stirring the mercury with an iron rod, the gold totally disappears. The proportion of mercury to gold is generally as six or eight to one. When the amalgam is cold it is squeezed through chamois leather for the purpose of separating the superfluous mercury; the gold, with about twice its weight of mercury, remains behind, forming a yellowish silvery mass of the consistence of butter. When the metal to be gilt is wrought or chased, it ought to be covered with quicksilver before the amalgam is applied, that this may be more easily spread; but when the surface of the metal is plain, the amalgam may be applied to it direct. When no such preparation is applied, the surface to be gilded is simply bitten and cleaned with nitric acid. A deposit of mercury is obtained on a metallic surface by means of "quicksilver water," a solution of nitrate of mercury,—the nitric acid attacking the metal to which it is applied, and thus leaving a film of free metallic mercury. The amalgam being equally spread over the prepared surface of the metal, the mercury is then sublimed by a heat just sufficient for that purpose; for, if it is too great, part of the gold may be driven off, or it may run together and leave some of the surface of the metal bare. When the mercury has evaporated, which is known by the surface having entirely become of a dull yellow color, the metal must undergo other operations, by which the fine gold color is given to it. First, the gilded surface is rubbed with a scratch brush of brass wire, until its surface be smooth; then it is covered over with a composition called "gilding wax," and again exposed to the fire until the wax is burnt off. This wax is composed of beeswax mixed with some of the following substances, viz., red ochre, verdigris, copper scales, alum, vitriol, borax; but, according to Dr. Lewis, the saline substances alone are sufficient, without any wax. By this operation the color of the gilding is heightened; and the effect seems to be produced by a perfect dissipation of some mercury remaining after the former operation. The dissipation is well effected by this equable application of heat. The gilt surface is then covered over with a saline composition, consisting of nitre, alum, or other vitriolic salts, ground together, and mixed up into a paste with water or weak ammonia. The piece of metal thus covered is exposed to a certain degree of heat, and then quenched in water. By this method its color is further improved and brought nearer to that of gold, probably by removing any particles of copper that may have been on the gilt sur-

face. This process, when skilfully carried out, produces gilding of great solidity and beauty; but owing to the exposure of the workmen to mercurial fumes, it is very unhealthy, and further there is much loss of mercury. Numerous contrivances have been introduced to obviate these serious evils; and the gilding furnace invented by M. D'Arcet is so arranged that the whole of the mercurial fumes are caught and recondensed for further use. Gilt brass buttons used for uniforms are gilt by this process, and there is an Act of Parliament yet unrepealed which prescribes 5 grains of gold as the smallest quantity that may be used for the gilding of 12 dozen of buttons 1 inch in diameter.

*Electro-gilding*, which has numerous and important applications, is described under ELECTRO-METALLURGY.

*Gilding of Pottery and Porcelain.*—The quantity of gold consumed for these purposes is very large. The gold used is dissolved in aqua-regia, and the acid is driven off by heat, or the gold may be precipitated by means of sulphate of iron. In this pulverulent state the gold is mixed with $\frac{1}{12}$th of its weight of oxide of bismuth, together with a small quantity of borax and gum water. The mixture is applied to the articles with a camel's hair pencil, and after passing through the fire the gold is of a dingy color, but the lustre is brought out by burnishing with agate and bloodstone, and afterwards cleaning with vinegar or white lead.

GILEAD (גִּלְעָד *i. e.* "hard" or "rugged") is sometimes used, both in earlier and in later writers, to denote the whole of the territory occupied by the Israelites eastward of Jordan, extending from the Arnon to the southern base of Hermon (Deut. xxxiv. 1; Judg. xx. 1; Jos., *Ant.* xii. 8, 3, 4). More precisely, however, it was the usual name of that mountainous district which is bounded on the N. by the Hieromax (Yarmuk), on the E. by the Jordan, on the S. by the Arnon, and on the W. by a line which may be said to follow the meridian of Ammân (Philadelphia or Rabbath-Ammon). It thus lay wholly within 31° 25′ and 32° 42′ N. lat., and 35° 34′ and 36° E. long. Excluding the narrow strip of low-lying plain along the Jordan, it has an average elevation of 2500 feet above the Mediterranean; but, as seen from the west, the relative height is very much increased by the depression of the Jordan valley. The range from the same point of view presents a singularly uniform outline, having the appearance of an unbroken wall; in reality, however, it is traversed by a number of deep ravines (wadys), of which the most important are the Yâbis, the Ajlûn, the Râjib, the Zerka (Jabbok), the Hesban, and the Zerka Maîn. The great mass of the Gilead range is formed of Jura limestone, but there are also occasional veins of sandstone. The eastern slopes are comparatively bare of trees; but the western are well supplied with oak, terebinth, and pine. The pastures are everywhere luxuriant, and the wooded heights and winding glens, in which the tangled shrubbery is here and there broken up by open glades and flat meadows of green turf, exhibit a beauty of vegetation such as is hardly to be seen in any other district of Palestine.

The first mention of "Mount Gilead" in Scripture occurs in Gen. xxxi., where it is said that the place where Jacob's covenant with his father-in-law was ratified was thenceforward called "the hill of witness" (גַּלְעֵד). The locality contemplated by the sacred writer was doubtless somewhere on the ridge of what is now known as Jebel Ajlûn, and probably not far from Mahneh (Mahanaim), near the head of the wady Yâbis.[1] Gilead next comes under notice in connection with the partition of the promised land among the twelve tribes of Israel. At the period of the conquest the portion of Gilead northward of the Jabbok (Zerka) belonged to the dominions of Og, king of Bashan, while the southern half was ruled by Sihon, king of the Amorites, having been at an earlier date wrested from Moab (Numb. xxi. 24; Deut. iii. 12–16). These two sections were allotted respectively to Manasseh and to Reuben and Gad, both districts being peculiarly suited to the pastoral and nomadic character of these tribes. A somewhat wild Bedouin disposition, fostered by their surroundings, was retained by the Israelite inhabitants of Gilead to a late period of their history, and seems to be to some extent discernible in what we read alike of Jephthah, of David's Gadites, and of the prophet Elijah.

After the close of the Old Testament history the word Gilead seldom occurs. It seems to have soon passed out of use as a precise geographical designation; for though occasionally mentioned by Apocryphal writers, by Josephus, and by Eusebius, the allusions are all vague, and show that those who made them had no definite knowledge of Gilead proper. In Josephus and the New Testament the name Peræa or *πέραν τοῦ Ἰορδάνου* is most frequently used; and the country is sometimes spoken of by Josephus as divided into small provinces called after the capitals in which Greek colonists had established themselves during the reign of the Seleucidæ. At present Gilead south of the Jabbok alone is known by the name of Jebel Jilad (Mount Gilead), the northern portion between the Jabbok and the Yarmuk being called Jebel Ajlûn. Jebel Jilad includes Jebel Osha, and has for its capital the town of Es-Salt. The cities of Gilead expressly mentioned in Scripture are Ramoth, Jabesh, and Jazer. The first of these has been satisfactorily identified with Es-Salt, and apparently ought not to be regarded as distinct from Mizpeh (Judg. xi. 11, 34), called also Mizpeh-Gilead (Judg. xi. 29), or Ramoth Mizpeh (Josh. xiii. 26).

GILES, ST. (ÆGIDIUS, EGIDIO, GIL, or GILLES), according to the *Breviarium Romanum* (1st September), was an Athenian of royal descent, and from his earliest years distinguished for piety and charity. On the death of his parents he, while still young, distributed amongst the poor his entire patrimony, including his very tunic, which garment effected a miraculous cure upon the poor sick man to whom it had been given. Shrinking from the publicity involved in this and many other (apparently involuntary) miracles, he betook himself to Provence, where, after a residence of two years with St. Cæsarius at Arles, he withdrew into the solitude of the neighboring desert, living upon herbs and the milk of a hind which came to his cell at stated hours. Here he was discovered after some time by the king of France, who on a hunting expedition had tracked the hind to the hermit's cave. With the reluctant consent of Ægidius, a monastery was now built on the spot, he being appointed its first abbot. The functions of this office he discharged with prudence and piety until his death, which occurred some years afterwards.

Some uncertainty attaches to the date, as well as to several other circumstances stated in this narrative. It is known that a certain Ægidius, whose name at least (*Αἰγίδιος*, from *αἰξ* or *αἰγίς*) is suggestive of a Greek origin, held an abbacy in Provence in the 6th century, and, at the instance of Bishop Cæsarius, undertook, in 514, a mission to Pope Symmachus on a question relating to certain rivalries between the sees of Arles and Vienne (Labbe, *Conc.* v. 439–40, ed. 1728); but the modern hagiologists, following the earliest *Acta*, which assign the legend to the period of a Catholic Visigothic king "Flavius" (Wamba or Ervigius), incline to distinguish the saint from the earlier abbot of the same name, and to fix the date of the former about the end of the 7th century. Of the existence of an abbey under the advocacy of St. Giles towards the end of the 9th century there can be no question (Ménard, *Hist. de Nismes*); while Benjamin of Tudela makes special mention of the crowds of foreigners from all countries who in his time (1160) frequented that shrine, which is situated on the Petit-Rhône, about 12 miles westward of Arles. In the 11th and following centuries the cultus of the saint, who came to be regarded as the special patron of lepers, beggars, and cripples, spread very extensively over Europe, especially in England, Scotland, France, Germany, and Poland. The church of St. Giles, Cripplegate, London, was built about 1090, while the hospital for lepers at St. Giles-in-the-Fields was founded by Queen Matilda in 1117. In England alone there are 146 churches dedicated to this saint; and they occur in every county except in those of Westmoreland and Cumberland (Parker, *Calendar of the Anglican Church*). In Edinburgh the church of St. Giles (*c.* 1359) could boast the possession of an arm-bone of its patron. Representations of St. Giles are very frequently met with in early French and German art, but are much less common in Italy and Spain (Jameson, *Sacred and Legendary Art*, pp. 768–770).

GILFILLAN, GEORGE (1813–1878), a clergyman of the United Presbyterian Church of Scotland, and a well-known popular writer, was born 30th January, 1813, at Comrie, Perthshire, where his father, the Rev. Samuel Gilfillan, also a man of some literary activity, was for many years minister of a Secession congregation. At Glasgow University and the theological hall, as at Comrie school, he took small help from formal lessons, and cared little for a high place in his

[1] See Beke, "Notes on an Excursion to Harran," etc., in vol. xxxii. of the *Journal of the Royal Geographical Society* (1862). "It was not the River Jordan, but the ridge of Mount Gilead, which formed the natural boundary of the possessions of the children of Israel."

classes or for proficiency in his prescribed studies, but applied himself to English literature, with a passion for reading, and a memory which held fast and arranged the contents of all the congenial books he met with. In March, 1836, he was ordained pastor of a Secession congregation in Dundee. His first effort beyond the pulpit was in 1839, when he issued *Five Discourses*, which, though neglected by the reading public, had many high merits, and gave the promise of more and of higher. Some time afterwards he rather unadvisedly published a sermon on "Hades," which, distinguished by bold but ill-sustained speculation, and by brilliant but irregular imagination, brought him under the scrutiny of his co-presbyters, and was ultimately withdrawn from circulation. Gilfillan next contributed a series of sketches of celebrated literary men to the *Dumfries Herald*, then edited by Thomas Aird; and these, along with several new ones, formed his first *Gallery of Literary Portraits*, a volume which appeared in 1846, and had a wide circulation. It was quickly followed by a *Second* and a *Third Gallery*, until almost all our great men were delineated. In 1851 the *Bards of the Bible* appeared; and this has been his most successful work. His aim was that it should be "a poem on the Bible;" and it was far more rhapsodical than critical. Still the little criticism that was scattered throughout it was more than enough to keep it from soaring into poetry; and the poetry, when pure, was so fragmentary, that instead of making one poem, it consisted of many small pieces, though in these there were grand strokes and exquisite touches of description. His sketching powers were next exercised upon the "Scottish Covenanters," and some of the heroes and episodes of the struggle received a glowing commemoration. At a later date he published similar representations of English Puritans and of Scotch Seceders, as champions of the rights of conscience. The most extensive publication with which Gilfillan was connected was Nichol's edition of the *British Poets;* and his office was not only to secure the utmost accuracy in the text of each poet's works, but also to furnish both a biography and a critical estimate. This engagement, taking him again and leisurely through the studies in which he had most delighted, and with which he had been most conversant, stimulated him to finish the work on which he had resolved in youth, and to which he had long given the brightest moods of his most genial hours. *Night, a Poem*, came out in 1867, when he was fifty-four years of age; but the work which had received his labor and his polishing during his best thirty years was far less successful than his most ephemeral productions. It was, indeed, an absolute failure. The theme was vast, vague, and unmanageable, even though the poem had extended to ninety, instead of nine books. Then, though his nature was largely and essentially poetic, Gilfillan had never given himself a training or even any practice in verse. Besides, he had already, in his many prose volumes, made use of all his poetic ideas and illustrations. There was not a line in *Night* that had not often sounded forth in his essays with stronger and finer melody. It was but a faint echo, and it had no music. His *History of a Man*, partly autobiographic and largely fabulous, was not written with his usual candor and geniality. Not less abundant and striking than his literature was his oratory; and wherever he appeared as a preacher, or as a lecturer on some literary or secular theme, he drew large crowds that were invariably thrilled by his eloquence. There was no token either of physical or of mental exhaustion when he died suddenly of heart disease, in the summer of 1878. He had just finished a new life of Burns, designed to accompany a new edition of the works of that poet.

GILGAL. Three towns of this name are mentioned in the Bible. (1.) The first and most important was situated "in the east border of Jericho" (Joshua iv. 19), on the border between Judah and Benjamin (Joshua xv. 7). Josephus places it 50 stadia from Jordan and 10 from Jericho (*Antiq.*, v. 1, 4), but these measurements do not agree with the position of Jericho with respect to Jordan. Jerome (*Onomasticon*, s. v. Galgal) places Gilgal 2 Roman miles from Jericho, and speaks of it as a deserted place held in wonderful veneration ("miro cultu") by the natives. This site, which in the Middle Ages appears to have been lost—Gilgal being shown further north—has lately been recovered by a German traveller (Schokke), and fixed by the English survey party. It is about 2 miles east of the site of Byzantine Jericho, and 1 mile from the modern Eriha. A fine tamarisk, traces of a church (which is mentioned in the 8th century), and a large reservoir, now filled up with mud, remain. The place is called Jiljûlieh, and its position north of the valley of Achor (Wâdy Kelt) and east of Jericho agrees well with the Biblical indications above mentioned. A tradition connected with the fall of Jericho is attached to the site (see *Tent Work in Palestine*, vol. ii. p. 7). (2.) The second Gilgal, mentioned in Joshua xii. 23, in connection with Dor, appears to have been situated in the maritime plain. Jerome (*Onomasticon*, s. v. Gelgel) speaks of a town of the name 6 Roman miles north of Antipatris (Râs el 'Ain). This is apparently the modern Kalkilia (vulgarly Galgilia), but about 3 miles north of Antipatris is a large village called Jiljûlieh, which is more probably the Biblical town. (3.) The third Gilgal (2 Kings iv. 38) was in the mountains (compare 2 Kings ii. 1–3) near Bethel. Jerome mentions this place also (*Onomasticon*, s. v. Galgala). It appears to be the present village of Jiljilia, about 7 English miles north of Beitîn (Bethel).

GILGIT (*Ghilghit*, etc.), probably a secluded valley-state on a tributary of the Upper Indus, but also applied to the tributary river and the whole of its basin, which is one of great interest in many respects, though as yet but imperfectly known. Captain J. Biddulph has for some time past been employed in Gilgit on the part of the Government of India, but no part of the information communicated by him has yet been made available. We shall describe the whole basin so far as materials allow.

About 10 miles below the elbow formed by the Indus (74° 42′ long., 35° 50′ lat.) in suddenly changing its course from a general direction north-west to a general direction south-west, in the vicinity of some of the highest mountains and vastest glaciers in the world, the Gilgit river enters it on the right bank, and with a general direction from the north-west. Thus the axis of the Gilgit valley is in fact a prolongation of that of the Indus valley in the direction maintained by the latter for some 300 miles above the elbow just mentioned. The length of the basin, so far as we know, on a line nearly west to east, is 120 miles; and its greatest width from north to south is about 75. The south limit of the basin is formed by the lofty watershed which divides the west-to-east Gilgit basin from the meridional basins of the (Lower) Indus, the Swat, and the Panjkora. At its intersection with the Indus-Swat watershed this limit rises to a peak of 19,400 feet, and at its intersection with the Panjkora-Chitral watershed to peaks of 18,490 and 19,440 feet. The western limit of the basin is the lofty watershed dividing it from the Mastúj valley on the upper waters of the Chitral river. This limit runs from the intersection last mentioned north-north-east and then north-east, till it joins the great mountain node in which the ranges of Hindu-Kush and the Muztagh (or Karakoram), according to our usual nomenclature, coalesce on the margin of the Pamir plateau. The northern limit of the basin is formed by the Muztagh itself, with peaks of 23,330 feet, 22,740 feet, 22,590 feet, 25,370 feet, 25,050 feet, and the basin is closed on the east by an offshoot of the Muztagh which, over the Indus elbow, forms that other great congeries of peaks and glaciers, of which the culminating point (Rákipúshi) rises to 25,550 feet, whilst seven others exceed 19,000 feet. South of the gorge through which the Gilgit waters force their way to the Indus this eastern barrier continues with summits rising to 14,000 and 15,000 feet, and joins the southern limit already described. This last-mentioned part of the barrier is known as the Niludar Hills, and has to be passed by the traveller who enters Gilgit from Kashmír, *i. e.*, from India. The remotest source of the Gilgit waters is in a lake called Shundar, close above Mastúj, and by which one of the chief passes leads from Gilgit and Yassin to Mastúj and Chitral. The Ghizar river runs out of this, and, after a course of 60 miles, is joined by the river of Yassin, coming from the north. These two may be considered to form the Gilgit river. The Yassin river itself is formed by two streams joining 6 or 8 miles above the village of Yassin, by each of which leads a pass. From the north-west comes the Tui or Moshabbar stream, by which lies the Moshabbar pass, probably at least 16,000 feet in height, and traversing a deep crevassed glacier for 8 miles. From where the road reaches the upper stream of Mastúj one path leads down the latter to Mastúj, and another upstream, crossing by the Baroghil pass (12,000 feet), over the prolongation of Hindu-Kush watershed, into Wakhán and the basin of the Upper Oxus. By the other stream, called the Warchagam river, coming from the north, a path leads

over the Darkot pass to the very source of the Mastúj river, and so also to the Baroghil pass. Another important stream, the Karambar, joins the Gilgit river from the north, about 21 miles below the confluence of the Ghizar and Yassin river. This flows through the Ishkaman valley, rising in a lake called the Karambar Sar, said to have been formed in recent years by glaciers damming up the stream, and by this runs the most easterly pass of those that lead from the Gilgit basin direct to Wakhán. It is believed to be very lofty and difficult, but it has not been explored. About 36 miles below the Ghizar-Yassin confluence, and 25 miles above the confluence with the Indus, on the right bank, stand the fort and village of Gilgit. Five miles below this the river is joined by the last important confluent, called the Nagar river. Recent information suggests that this stream has a very lengthened course, flowing, in fact, from the northern side of the Muztagh in the vicinity of the Karambar lake; and, if this be so, a large addition must be made to the Gilgit basin as a whole. But of this we have no defined knowledge.

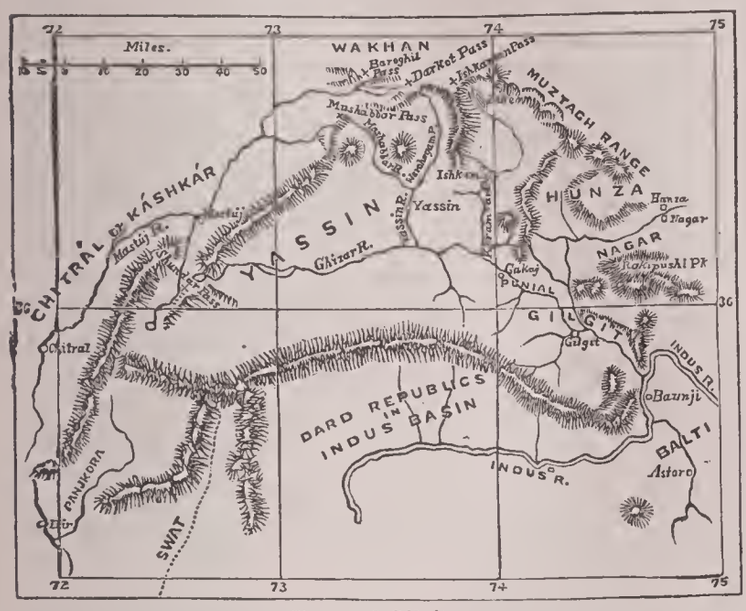

Chart of Gilgit.

The states occupying the basin of Gilgit, are, or till lately were, the following:—

1. *Yassin.*—This embraces all the upper or western part of the basin, including the Ishkaman valley. For some generations, at least, the relations of this state with Gilgit were hostile, whilst it was in intimate or dependent connexion with the kings of Chitral, and held by a member of the same family. Indeed, it was regarded and named as a subdivision of Upper Chitral. We have no present information as to the population or even the number of villages in this lofty district; but the route surveys show about thirty. The height of the chief place, Yassin, is 7770 feet. The country was visited twice in 1870 by a very gallant but not prudent traveller, Mr. George Hayward, and on the second visit in July of that year he was murdered by the agents of the chief Mir Wali, whilst on his way to the Darkot pass, in hope of penetrating to Wakhán and the exploration of Pamir. It is believed that Yassin has recently been annexed by the troops of Kashmír.

2. Next below Yassin is the small state of *Puniál* or *Punyá*, long held by separate rajas, and held by them now in dependence on Kashmír. It occupies the narrow valley of the river for a length of 25 miles, and contains nine villages, varying in height from 7000 feet down to 5500 feet. The villages are all within little forts, so that (as in Khorasan, and in Marco Polo's narrative) villages and forts are synonymous. At evening, the people who have been occupied in their fields come within the wall, and the gates are closed. Sentries guard the towers all night, and at dawn an armed patrol goes forth and makes the round of all places that might harbor an enemy, before the people issue to their avocations. In this part of the valley there are frequent *mauvais pas* on the road, where passage is difficult, and where a few men might stop a host. These are called by the old Persian name of *darband* (porta clausa), like the famous Iron Gate on the Caspian. The upper village of Puniál, called Gákúj, was till recently the furthest point to which the power of Kashmír, and therefore the influence of the British Government, extended. It stands 6940 feet above the sea. Between Gákúj and Yassin the road passes through a natural gate of rock. The ruler of Puniál is, or was in 1873, Raja 'Isa Bágdur, an old man who, in his little kingdom of nine villages, displayed some of the best characteristics of a king,—feared by his enemies, liked and implicitly obeyed by his people. On meeting him they go up and kiss his hand.

Gilgit occupies the remainder of the main valley down to the Indus, but we shall first speak of Hunza and Nagar, lying in the eastmost part of the basin, on the Nagar river.

3 and 4. *Nagar* lies on the left bank of the river, *Hunza* opposite, and the two "capitals," so to call them, lie just over against one another. They are distinct states under distinct princes, and their people of distinct Mussulman sects. Whilst Nagar sends a small complimentary tribute to the maharaja of Kashmír, Hunza (also called Kanjúd), a more warlike country, has often been at active enmity with him, coming down upon his villages in Gilgit, sweeping off the inhabitants, and selling them into slavery. Though the people of both states seem to speak the same language, Dr. Leitner says the Nagar people are shorter, stouter, and fairer than the Hunza folk, whom he calls "tall skeletons" and desperate robbers. He says he met a man of Nagar whose yellow moustache and general appearance made him believe almost that he had seen a Russian. The Kanjúdis are the terror of the Kirghiz on the upper waters of the Yarkand, and of the traders from Ladák to that territory.

5. *Gilgit* occupies all the lower part of the main valley to the Indus. If we take the whole length of the river, from the source in the Shundar lake to the Indus, at 135 miles (which, like the other distances here, is taken with a 5-mile opening of the compass, omitting minor windings), Yassin will occupy 75 miles of this, Puniál 25, and Gilgit 35. The lower part of Gilgit is a valley from 1 to 3 miles wide, bounded on each side by steep rocky mountains. The valley contains stony alluvial plateaus of various forms and at various levels above the river, which flows between cliffs worn in these. The greater part of this space is barren, but as usual in those high regions there is in front of each lateral ravine a cultivated space watered by the tributary stream, and on that a collection of houses. The village of Gilgit is 4800 feet above the sea, and stands on a flat plain of the river alluvium, forming a terrace 30 or 40 feet above the water. The cultivation here covers a square mile or thereabouts, irrigated from the nearest lateral stream. The houses are flat-roofed, scattered over the plain in twos and threes, among groups of fruit-trees. The destruction was great in the wars to which Gilgit has been subject in the last half-century, and it will take long before the village recovers the former abundance of fruit-trees. The fort of Gilgit is the chief stronghold of the maharaja of Kashmír in Dardistán.

There is very little snow-fall at Gilgit. The vegetable products are wheat, barley, naked barley, rice (at Gilgit village only), maize, millet, buckwheat, various pulses, rape, and cotton; and of fruits, mulberries, peaches, apricots, grapes, apples, quinces, pears, green-gages, figs (poor), walnuts, pomegranates, and *elæagnus*, besides musk and watermelons. Silk is grown in very small quantity. There are three fabrics from it,—one-half wool, much worn by those above the common peasant, one-half cotton, and the third all silk, strong though loosely woven, and prized for girdles. Gold is washed from the river-gravels as in many other parts of the Indus basin. The vine is much cultivated in some parts of the valley. In Puniál it is grown in small vineyards, the vines being often old trees; the whole vineyard is covered with a horizontal framework of sticks, 2 to 4 feet above the ground, and over this the vines are trained

The people of the basin are all reckoned to be Dards though there is this perplexing fact, that (setting aside dialects) two languages are spoken among them, which are entirely and radically different,—the *Khajuna* language, which is spoken in Hunza, Nagar, and Yassin, being one of which no relation has yet been traced to any other tongue, whilst the *Shina*, spoken, in the rest of the basin, is clearly Aryan, and kindred to the Sanskritic languages of India. Now there seems to be no doubt entertained that the Yassin people at least have all the characters of undisputed Dards. It is worth while to exhibit the numerals from these two languages.

| | Shina. | Khajuna. |
|---|---|---|
| One | *eyk* | *hann.* |
| Two | *do* | *altàtz.* |
| Three | *tré* | *uskó.* |
| Four | *tshar* | *waltó.* |
| Five | *poñ* | *tshudó.* |
| Six | *shá* | *mishindó.* |
| Seven | *sath* | *taló.* |
| Eight | *atsh* | *altambu.* |
| Nine | *nau* | *umtshò.* |
| Ten | *dáy* | *tóromo.* |
| Eleven | *akáy* | *turma-hann.* |
| Twelve | *báy* | *turma-altatz.* |

The Dards not only occupy the Gilgit basin, but also extend down the Indus basin, in which they form a number of small republican communities (whilst the states of the Gilgit basin are all, so to speak, monarchical), reaching to Batera,

where the Pushto-speaking tribes who are of Afghan blood, or at least Afghanized, commence. The Dards are described as decidedly Aryan in features, broad-shouldered, well-proportioned, active, and enduring. The hair is usually black but sometimes brown, the eyes brown or hazel, the skin sometimes fair enough to show a ruddy complexion; the voice and manner of speech are harsh. In bearing they are cheerful, bold, and independent, not disobliging when rightly handled, and as a race decidedly clever. They do not care much for human life, but still are not blood-thirsty. They are, says Mr. Drew, "a people who will meet one on even terms, without sycophancy or fear, and without impertinent self-assertion." The women are not pretty in Gilgit, but those of Yassin have a better repute, and indeed Hayward says: "The women have a more English cast of countenance than any I have yet seen in Asia, light-brown locks prevailing." The dress is entirely woollen, trousers, choga (long robe like a dressing-gown), and girdle. The cap is most characteristic; it is a long woollen bag rolled up at the edge till it fits close to the head. The feet are wrapt in scraps of leather, with a long strip as a binder. There is a distinct separation into castes, of which Drew counts five, others only four. The lowest caste is Dúm, the name of a low caste found all over India to the extreme Deccan,—a notable circumstance. The middle castes, Shin and Yashkun, form the body of the Dard people. The pure Shin looks more like a European than any high-caste Brahman of India. A Shin man may marry a Yashkun woman, but a Yashkun man may not marry a Shin woman. The Yashkuns predominate in Gilgit basin; the Shins in Haramosh (up the Indus valley) and Astor (east of Gilgit), and in the states of the Indus basin below Gilgit. It is a notable circumstance that the Dards abhor the cow, much as the Mussulmans abhor swine. They will not drink cow's milk, nor make or eat butter. In this last point the Indo-Chinese nations generally and the Chinese resemble them, but not in the dislike to the animal. The Dards will not burn cow-dung nor touch the cow if they can help it.

All the Dards of the Gilgit basin are Mahometans, and of three different sects, Sunnis, Shiahs, and Moláis (Mullahis?), the last being a Shiah offshoot and modification. The last two drink wine, the Sunnis do not. Gilgit proper is half Sunni, half Shiah; Puniál, Molái; Hunza, Molái—these are great wine drinkers; Nagar, Shiah; Ishkaman, Molái; Yassin, Molái, and Sunni, without any Shiahs. Till lately they were very loose Mahometans. Some of the Moslem officers in the Sikh and Dogra garrisons have spread greater rigidity. The wine is put in large earthenware jars, which are then buried for a time. The people do not understand clarifying the wine. Dr. Leitner tasted some which was very palatable, but looked more like mutton-broth than wine. A kind of beer is also made. Polo is a favorite game throughout Dardistán, as in Balti, which is its home, or one of its homes, and it extends to the Chitral country. Wherever Baltis or Dards live, the polo-ground may be looked for. Target archery with firearms is also a favorite amusement; they use stones for bullets, with a thin coating of lead. They are excellent shots. The Jew's harp is played; and the invention is ascribed to King David.

*History.*—The Dards are located by Ptolemy with surprising accuracy (*Duradæ*) on the west of the Upper Indus, beyond the head-waters of the Swat river (*Soastus*), and north of the *Gandaræ, i. e.*, the Gandháras, who occupied Peshawar and the country north of it. The *Dardas* and *Chinas* also appear in many of the old Pauranic lists of peoples, the latter probably representing the *Shin* branch of the Dards. This region was traversed by two of the Chinese pilgrims of the early centuries of our era, who have left records of their journeys, *viz.*, Fahian, coming from the north, c. 400, and Hwen-thsang, ascending from Swat, c. 631. The latter says: "Perilous were the roads, and dark the gorges. Sometimes the pilgrim had to pass by loose cords, sometimes by light stretched iron chains. Here there were ledges hanging in mid-air; there flying bridges across abysses; elsewhere paths cut with the chisel, or footings to climb by." Yet even in these inaccessible regions were found great convents, and miraculous images of Buddha. How old the name of *Gilgit* is we do not know, but it occurs in the writings of the great Mahometan savant Al-Birúni, in his notices of Indian geography. Speaking of Kashmír, he says: "When thou hast passed the defile which forms the entrance and hast penetrated into the plain, thou hast to thy left the mountains of Balaur and Shamílán. Two days' journey distant are the Turks called *Bhatáwarián*, whose king takes the name of *Bhatsháh*. The country which these Turks occupy is called *Kilkit* (or Gilgit), *Asora*, and *Shaltás*. Their tongue is Turk, the people of Kashmír have to suffer much from their raids".—(Reinaud, "Extraits," in *Journal Asiatique*, ser. iv. tom. iv.). There are difficult matters for discussion here. It is impossible to say what ground the writer had for calling the people *Turks*. But it is curious that the *Shins* say they are all of the same race as the Moghuls of India, whatever they may mean by that. Gilgit, as far back as tradition goes, was ruled by rajas of a family called Trakane. When this family became extinct the valley was desolated by successive invasions of neighboring rajas, and in the 20 or 30 years ending with 1842 there had been five dynastic revolutions. The most prominent character in the history was a certain Gaur Rahman or Gauhar Aman, chief of Yassin, a cruel savage and man-seller, of whom many evil deeds are told. Being remonstrated with for selling a *mullah*, he said, "Why not? the Koran, the word of God, is sold; why not sell the expounder thereof?" The Sikhs entered Gilgit about 1842, and kept a garrison there. When Kashmír was made over to Maharaja Gúláb Singh of Jámú in 1846, by Lord Hardinge, the Gilgit claims were transferred with it. And when a commission was sent to lay down boundaries of the tracts made over, Mr. Vans Agnew (afterwards murdered at Multán) and Lieut. Ralph Young of the Engineers visited Gilgit, the first Englishmen who did so. The Dogras (Gúláb Singh's race) had much ado to hold their ground, and in 1852 a catastrophe occurred, parallel on a smaller scale to that of the English troops at Cabul. Nearly 2000 men of theirs were exterminated by Gaur Rahman and a combination of the Dards; only one person, a soldier's wife, escaped, and the Dogras were driven away for eight years. Gúláb Singh would not again cross the Indus, but after his death (in 1857) the present Maharaja Ranbir Singh longed to recover lost prestige. In 1860 he sent a force into Gilgit. Gaur Rahman just then died, and there was little resistance. The Dogras have twice since then taken Yassin, but did not hold it. Now, recently, it is believed, they have not only occupied Yassin, but have invaded Chitrál also. They also, in 1866, invaded Darel, one of the most secluded Dard states, to the south of the Gilgit basin, but withdrew again. Population, 26,000.

The chief source of the information in this article is an excellent work by Mr. Frederick Drew, who was long in the employment of the maharaja, *The Jummoo and Kashmir Territories, a Geographical Account*, 1875. Use has also been made of Dr. Leitner's uncompleted work, *Results of Tour in Dardistan, etc.*; of Mr. Hayward's letters (*Proc. Roy. Geog. Soc.*, vol. xv., and *Journ. Roy. Geog. Soc.*, vol. xli.); and of Col. Walker's *Report on the Survey Dept.* for 1877–78. The narrative of "the ullah," who performed the remarkable journeys noticed briefly in that report, has been for the present withheld from publication by the Indian Government, but the map corrected by his surveys is of extreme interest and value. By and by we may hope for the publication of Captain Biddulph's observations, which will doubtless throw much new light on this secluded and interesting region. (H. Y.)

GILL, John (1697–1771), a Baptist minister and learned Rabbinical scholar, was born at Kettering, Northamptonshire, in 1697. On account of the limited means of his parents, he owed his education chiefly to his own perseverance. After receiving baptism in November, 1716, he began to preach, and officiated at Higham Ferrers, as well as occasionally at his native place, until the beginning of 1719, when he became pastor of the Baptist congregation at Horsleydown, in Southwark, where he continued fifty-one years. In 1748 he received the degree of D. D. from the university of Aberdeen. He died at Camberwell, October 14, 1771.

His principal works are *Exposition of the Song of Solomon*, 1728; *The Prophecies of the Old Testament respecting the Messiah considered*, 1728; *Treatise on the Doctrine of the Trinity*, 1731; *Cause of God and Truth*, in 4 vols., 1731; *Exposition of the Bible*, in 10 vols., in preparing which he formed a large collection of Hebrew and Rabbinical books and MSS.; *Dissertation on the Antiquity of the Hebrew Language—Letters, Vowel Points, and Accents*, 1767; *A Body of Doctrinal Divinity*, 1767; *A Body of Practical Divinity*, 1770; and *Sermons and Tracts*, with a memoir of his life, 1773. An edition of his *Exposition of the Bible* appeared in 1816 with a memoir by Dr. Ripon, which has also appeared separately. Various editions of several of his other works have also appeared.

GILLESPIE, George (1613–1648), a prominent member of the presbyterian party in the Westminster Assembly, was born at Kirkcaldy, where his father was parish minister, on the 21st of January, 1613, and entered the university of St. Andrews as a "presbytery bursar" in 1629. On the completion of a brilliant student career, he became domestic chaplain to Lord Kenmure, and afterwards to the earl of Cassilis, his conscience not permitting him to accept the episcopal ordination which was at that time in Scotland an indispensable condition of induction to a parish. While with the earl of Cassilis he wrote his first work, *A Dispute against the English Popish Ceremonies obtruded upon the Church of Scotland*, which, opportunely published (but without the author's name) in the summer of 1637, at-

tracted considerable attention, and within a few months had been found by the privy council to be so damaging that by their orders all available copies were called in and burnt. In April, 1638, soon after the authority of the bishops had been set aside by the nation, Gillespie was ordained minister of Wemyss (Fife) by the presbytery of Kirkcaldy, and in the same year was a member of the famous Glasgow Assembly, before which he preached a sermon so pronounced against royal interference in matters ecclesiastical as to call for some remonstrance on the part of Argyll, the Lord High Commissioner. In 1642 Gillespie was translated to Edinburgh; but the brief remainder of his life was chiefly spent in the conduct of public business in London. Already, in 1640, he had accompanied the commissioners of the peace to England as one of their chaplains; and in 1643 he was appointed by the Scottish church one of the four commissioners to the Westminster Assembly. Here he took a prominent part in almost all the protracted discussions on church government, discipline, and worship, supporting Presbyterianism by numerous controversial writings, as well as by an unusual fluency and readiness in debate. On the Erastian question, in particular, besides a series of vigorous pamphlets against Coleman (*A Brotherly Examination of some Passages in Mr. Colemam's late printed Sermon*, etc.; *Nihil Respondes; Male Audis*), he published in 1646 a large work entitled *Aaron's Rod Blossoming, or the Divine Ordinance of Church-government vindicated*, which is deservedly regarded as a really able statement of the case for an exclusive spiritual jurisdiction of the Church. Shortly after his return to Scotland, Gillespie was elected moderator of the Assembly (1648); but the laborious duties of that office (the court continued to sit from 12th July to the 12th of August) told fatally on a constitution which, at no time very vigorous, had of late years been much overtaxed; and, after many weeks of great weakness, he died at Kirkcaldy on the 17th of December, 1648. In acknowledgment of his great public services, a sum of £1000 Scots was voted, though destined never to be paid, to his widow and children by the committee of estates. A simple tombstone, which had been erected to his memory in Kirkcaldy parish church, was in 1661 publicly broken at the cross by the hand of the common hangman, but was restored in 1746. Among the other works of Gillespie may be mentioned the *Treatise of Miscellany Questions, wherein many useful Questions and cases of Conscience are discussed and resolved*, published posthumously (1649); and *The Ark of the Testament opened*, being a treatise on the covenant of grace, also posthumous (2 vols., 1661–1677).

GILLESPIE, Thomas (1708–1774), one of the founders of the Scottish "Presbytery of Relief," was born in the parish of Duddingston, Midlothian, in 1708. On the completion of his literary course at the university of Edinburgh, he for a short time attended a small theological seminary at Perth, and afterwards studied divinity under Dr. Doddridge at Northampton, where he received ordination in January, 1741. In August of the same year he was admitted minister of the parish of Carnock, Fife, the presbytery of Dunfermline agreeing, not only to sustain as valid the ordination he had received in England, but also to allow a qualification of his subscription to the church's doctrinal symbol, so far as it had reference to the sphere of the civil magistrate in matters of religion. Having on conscientious grounds persistently absented himself from the meetings of presbytery held for the purpose of ordaining an unacceptable presentee as minister of Inverkeithing, he was, after an unobtrusive but useful ministry of ten years, deposed for contumacy by the Assembly of 1752; he continued, however, to preach, first at Carnock, and afterwards in Dunfermline, where a large congregation gathered round him; but it was not until 1761, and after repeated efforts to obtain readmission to the church, that, in conjunction with Boston of Jedburgh and Collier of Colinsburgh, he formed a distinct communion under the name of The Presbytery of Relief,—relief, that is to say, "from the yoke of patronage and the tyranny of the church courts." He died on the 19th January, 1774. His only literary efforts were an *Essay on the Continuation of Immediate Revelations in the Church*, and a *Treatise on Temptation*, characterized by considerable laboriousness and some ability. Both works appeared posthumously (1774). See *Lives of Fathers of the United Presbyterian Church* (Edin. 1849).

GILLIES, John (1747–1836), the historian of ancient Greece, was born in 1747 at Brechin, in Forfarshire. He was educated at the university of Glasgow, where he greatly distinguished himself, and where, at the age of twenty, he officiated for a short time as substitute for the professor of Greek. Subsequently he received an engagement as tutor in the family of Lord Hopetoun, who afterwards conferred on him a pension for life. In 1784 he completed his principal work, the *History of Ancient Greece, its Colonies and Conquests*, which he published two years later in 2 vols. 4to. This work gives a clear and generally accurate account of the various states of Greece, and the progress of each in literature and the arts. The learning it displays is considerable, but its reflections are generally somewhat trite, and the style is abrupt and frequently diffuse. It enjoyed, however, for some time a great popularity, and was translated into French and German. It was long a favorite text-book for schools, but is now completely superseded. On the death of Robertson, Gillies was appointed historiographer-royal of Scotland. In his old age he retired to Clapham, where he died 15th February, 1836, in the 90th year of his age.

Of his other works, none of which are much read, the principal are—*View of the Reign of Frederick II. of Prussia, with a Parallel between that Prince and Philip II. of Macedon*, 1789; *Translation of Aristotle's Rhetoric, and of his Ethics and Politics*; and *History of the World from Alexander to Augustus*, in 2 vols., 1807.

GILLRAY, James (1757–1815), one of the most eminent of caricaturists, was born at Chelsea in 1757. His father, a native of Lanark, had served as a soldier, losing an arm at Fontenoy, and was admitted first as an inmate, and afterwards as an out-door pensioner, at Chelsea Hospital. Gillray commenced life by learning letter-engraving, in which he soon became an adept. This employment, however, proving irksome, he wandered about for a time with a company of strolling players. After a very chequered experience he returned to London, and was admitted a student in the Royal Academy, supporting himself by engraving, and probably issuing a considerable number of caricatures under fictitious names. Hogarth's works were the delight and study of his early years. Paddy on Horseback, which appeared in 1779, is the first caricature which is certainly his. Two caricatures on Rodney's naval victory, issued in 1782, were among the first of the memorable series of his political sketches. The name of Gillray's publisher and printseller, Miss Humphrey—whose shop was first at 227 Strand, then in New Bond Street, then in Old Bond Street, and finally in St. James's Street—is inextricably associated with that of the caricaturist. Gillray lived with Miss (often called Mrs.) Humphrey during all the period of his fame. It is believed that he several times thought of marrying her, and that on one occasion the pair were on their way to the church, when Gillray said:—"This is a foolish affair, methinks, Miss Humphrey. We live very comfortably together; we had better let well alone." There is no evidence, however, to support the stories which scandalmongers have invented about their relations. Gillray's plates were exposed in Humphrey's shop window, where eager crowds examined them. A number of his most trenchant satires are directed against George III., who, after examining some of Gillray's sketches, said, with characteristic ignorance and blindness to merit, "I don't understand these caricatures." Gillray revenged himself for this utterance by his splendid caricature entitled A Connoisseur Examining a Cooper, which he is doing by means of a candle on a "save-all;" so that the sketch satirizes at once the king's pretensions to knowledge of art and his miserly habits.

The excesses of the French Revolution made Gillray conservative; and he issued caricature after caricature ridiculing the French and Napoleon, and glorifying John Bull. He is not, however, to be thought of as a keen political adherent of either the Whig or the Tory party; he dealt his blows pretty freely all round. His last work, from a design by Bunbury, is entitled Interior of a Barber's Shop in Assize Time, and is dated 1811. While he was engaged on it he became mad, although he had occasional intervals of sanity, which he employed on his last work. The approach of madness must have been hastened by his intemperate habits. Gillray died on the 1st of June, 1815, and was buried in St. James's churchyard, Piccadilly.

The times in which Gillray lived were peculiarly favorable to the growth of a great school of caricature. Party warfare was carried on with great vigor and not a little

bitterness; and personalities were freely indulged in on both sides. Gillray's incomparable wit and humor, knowledge of life, fertility of resource, keen sense of the ludicrous, and beauty of execution, at once gave him the first place among caricaturists. He is honorably distinguished in the history of caricature by the fact that his sketches are real works of art. The ideas embodied in some of them are sublime and poetically magnificent in their intensity of meaning; while the coarseness by which others are disfigured is to be explained by the general freedom of treatment common in all intellectual departments in the eighteenth century. The historical value of Gillray's work has been recognized by accurate students of history. As has been well remarked: "Lord Stanhope has turned Gillray to account as a veracious reporter of speeches, as well as a suggestive illustrator of events." His contemporary political influence is borne witness to in a letter from Lord Bateman, dated November 3, 1798. "The Opposition," he writes to Gillray, "are as low as we can wish them. You have been of infinite service in lowering them and making them ridiculous." Gillray's extraordinary industry may be inferred from the fact that nearly 1000 caricatures have been attributed to him; while some consider him the author of 1600 or 1700. He is invaluable to the student of English manners as well as to the political student. He attacks the social follies of the time with seathing satire; and nothing escapes his notice, not even a trifling change of fashion in dress. The great tact Gillray displays in hitting on the ludicrous side of any subject is only equalled by the exquisite finish of his sketches—the finest of which reach an epic grandeur and Miltonic sublimity of conception.

Gillray's caricatures are divided into two classes, the political series and the social. The political caricatures form really the best history extant of the latter part of the reign of George III. They were circulated not only over Britain but throughout Europe, and exerted a powerful influence. In this series, George III., the Queen, the Prince of Wales, Fox, Pitt, Burke, and Napoleon are the most prominent figures. In 1788 appeared two fine caricatures by Gillray. Blood on Thunder fording the Red Sea represents Lord Thurlow carrying Warren Hastings through a sea of gore; Hastings looks very comfortable, and is carrying two large bags of money. Market-Day pictures the ministerialists of the time as horned cattle for sale. Among Gillray's best satires on the king are—Farmer George and his Wife, two companion plates, in one of which the king is toasting muffins for breakfast, and in the other the queen is frying sprats; The Anti-Saccharites, where the royal pair propose to dispense with sugar, to the great horror of the family; A Connoisseur Examining a Cooper; Temperance enjoying a Frugal Meal; Royal Affability; A Lesson in Apple Dumplings; and The Pigs Possessed. Among his other political caricatures may be mentioned—Britannia between Scylla and Charybdis, a picture in which Pitt, so often Gillray's butt, figures in a favorable light; The Bridal Night; The Apotheosis of Hoche, which concentrates the excesses of the French Revolution in one view; The Nursery with Britannia reposing in Peace; The First Kiss these Ten Years (1803), another satire on the peace, which is said to have greatly amused Napoleon; The Handwriting upon the Wall; The Confederated Coalition, a fling at the coalition which superseded the Addington Ministry: Uncorking Old Sherry; The Plum-Pudding in Danger; Making Decent, *i. e.*, Broad-bottomites getting into the Grand Costume; Comforts of a Bed of Roses; View of the Hustings in Covent Garden; Phaethon Alarmed; and Pandora opening her Box. The miscellaneous series of caricatures, although they have scarcely the historical importance of the political series, are more readily intelligible, and are even more amusing. Among the finest are —Shakespeare Sacrificed; Flemish Characters [two plates]; Twopenny Whist; Oh! that this too solid flesh would melt; Sandwich Carrots; The Gout; Comfort to the Corns; Begone Dull Care; The Cow-Pock, which gives humorous expression to the popular dread of vaccination; Dilletanti Theatricals; and Harmony before Matrimony and Matrimonial Harmonies—two exceedingly good sketches in violent contrast to each other.

A selection of Gillray's works appeared in parts in 1818; but the first good edition was Thomas M'Lean's, which was published with a key, in 1830. A somewhat bitter attack, not only on Gillray's character, but even on his genius, appeared in the *Athenæum* for October 1, 1831, which was successfully refuted by J. Landseer in the *Athenæum* a fortnight later. In 1851 Henry G. Bohn put out an edition, from the original plates, in a handsome folio, the coarser sketches being published in a separate volume. For this edition Thomas Wright and R. H. Evans wrote a valuable commentary, which is a good history of the times embraced by the caricatures. The next edition, entitled *The Works of James Gillray, the Caricaturist: with the Story of his Life and Times* (Chatto and Windus, 1874), was the work of Thomas Wright, and, by its popular exposition and narrative, introduced Gillray to a very large circle formerly ignorant of him. This edition, which is complete in one volume, contains two portraits of Gillray, and upwards of 400 illustrations. Mr. J. J. Cartwright, in a letter to the *Academy* (Feb. 28, 1874), drew attention to the existence of a MS. volume, in the British Museum, containing letters to and from Gillray, and other illustrative documents. The extracts he gave were used in a valuable article in the *Quarterly Review* for April, 1874. See also the *Academy* for Feb. 21 and May 16, 1874.

For a contemporary life of Gillray, see George Stanley's notice in his edition of *Bryan's Dictionary of Painters*. There is a good account of him in Wright's *History of Caricature and Grotesque in Literature and Art*, 1865. See also the article CARICATURE.

GILLYFLOWER, a popular name applied to various flowers, but principally to the clove, *Dianthus Caryophyllus*, of which the carnation is a cultivated variety, and to the stock *Mathiola incana*, a well-known garden favorite. The word is sometimes written gilliflower or gilloflower, and is reputedly a corruption of July-flower, "so called from the month they blow in." Phillips, in his *Flora Historica*, remarks that Turner (1568) "calls it geloner, to which he adds the word stock, as we would say gelouers that grow on a stem or stock, to distinguish them from the clove-gelouers and the wall-gelouers. Gerard, who succeeded Turner, and after him Parkinson, calls it gilloflower and thus it travelled from its original orthography until it was called July-flower by those who knew not whence it was derived." Dr. Prior, in his useful volume on the *Popular Names of British Plants*, very distinctly shows the origin of the name. He remarks that it was "formerly spelt gyllofer and gilofre with the *o* long, from the French *giroflée*, Italian *garofalo* (M. Lat. *gariofilum*), corrupted from the Latin *Caryophyllum*, and referring to the spicy odor of the flower, which seems to have been used in flavoring wine and other liquors to replace the more costly clove of India. The name was originally given in Italy to plants of the pink tribe, especially the carnation, but has in England been transferred of late years to several cruciferous plants." The gillyflower of Chaucer and Spenser and Shakespeare was, as in Italy, *Dianthus Caryophyllus;* that of later writers and of gardeners, *Mathiola*. Much of the confusion in the names of plants has doubtless arisen from the vague use of the French terms *giroflée*, *oeillet*, and *violette*, which were all applied to flowers of the pink tribe, but in England were subsequently extended and finally restricted to very different plants. The use made of the flowers to impart a spicy flavor to ale and wine is alluded to by Chaucer, who writes—

> "And many a clove gilofre
> To put in ale;"

also by Spenser, who refers to them by the name of sops in wine, which was applied in consequence of their being steeped in the liquor. In both these cases, however, it is the clove-gillyflower which is intended, as it is also in the passage from Gerard, in which he states that the conserve made of the flowers with sugar "is exceeding cordiall, and wonderfully above measure doth comfort the heart, being eaten now and then." The principal other plants which bear the name are the wallflower, *Cheiranthus Cheiri*, called wall-gillyflower in old books; the dame's violet, *Hesperis matronalis*, called variously the queen's, the rogue's, and the winter gillyflower; the ragged robin, *Lychnis flos cuculi*, called marsh-gillyflower; the water-violet, *Hottonia palustris*, called water-gillyflower; and the thrift, *Armeria vulgaris*, called sea-gillyflower. As a separate designation it has in modern times been chiefly applied to the *Mathiola* or stock, but it is now very little used.

GILPIN, BERNARD (1517–1583), rector of Houghton-le-Spring, distinguished by the unusual way in which he carried out his conception of the duties of a Christian pastor, was descended from a Westmoreland family, and was born at Kentmere, in 1517. At Oxford he first adhered to the conservative side, and defended the doctrines of the church against Hooper; but his confidence was somewhat shaken by another public disputation which he had with Peter Martyr. In 1552 he preached before King Edward VI. a sermon on sacrilege, which was duly published, and displays the high ideal which even then he had formed of the clerical office; and about the same time he was presented to the vicarage of Norton, in the diocese of Durham, and obtained a license through William Cecil, as a general,

preacher throughout the kingdom as long as the king lived. Instead of settling down in England, however, he resigned his vicarage, and went abroad to pursue his theological investigations, and if possible satisfy his mind on some disputed matters. He carried out this intention at Louvain, Antwerp, and Paris; and from a letter of his own, dated Louvain, 1554, we get a glimpse of the quiet student rejoicing in an "excellent library belonging to a monastery of Minorites." Returning to England towards the close of Queen Mary's reign, he was invested by his uncle, Dr. Tonstall, bishop of Durham, with the archdeaconry of Durham, to which the rectory of Effington was annexed. The freedom of his attacks on the vices, and especially the clerical vices, of his times excited hostility against him, and he was formally brought before the bishop on a charge consisting of thirteen articles. Tonstall, however, not only dismissed the case, but presented the offender with the rich living of Houghton-le-Spring; and when the accusation was again brought forward, he again protected him. Enraged at this defeat, Gilpin's enemies laid their complaint before Dr. Bonner, bishop of London, and he immediately gave orders for his apprehension. Upon this Gilpin prepared for martyrdom; and, having ordered his house-steward to provide him with a long garment, that he might "goe the more comely to the stake," he set out for London. Providentially, however, he broke his leg on the journey, and his arrival was thus delayed till the news of Queen Mary's death freed him from further danger. He at once returned to Houghton, and there he continued to labor till his death in 1583. When the Roman Catholic bishops were deprived, he was offered the see of Carlisle; but he declined the honor. At Houghton his course of life was a ceaseless round of benevolent activity. His hospitable manner of living was the admiration of all. In his household, he spent "every fortnight 40 bushels of corn, 20 bushels of malt, and an ox, besides a proportional quantity of other kinds of provisions." Strangers and travellers found a ready reception; and even their horses were treated with so much care that it was humorously said that, if one were turned loose in any part of the country, it would immediately make its way to the rector of Houghton. Every Sunday from Michaelmas till Easter was a public day with Gilpin. For the reception of his parishioners he had three tables well covered,—one for gentlemen, the second for husbandmen, the third for day-laborers; and this piece of hospitality he never omitted, even when losses or scarcity made its continuance difficult. He built and endowed a grammar-school at a cost of upwards of £500, educated and maintained a large number of poor children at his own charge, and provided the more promising pupils with means of studying at the universities. So many young people, indeed, flocked to his school that there was not accommodation for them in Houghton, and he had to fit up part of his house as a boarding establishment. Grieved at the ignorance and superstition which the remissness of the clergy permitted to flourish in the neighboring parishes, he used every year to visit the most neglected parts of Northumberland, Yorkshire, Cheshire, Westmoreland, and Cumberland; and that his own flock might not suffer, he was at the expense of a constant assistant. Among his parishioners he was looked up to as a judge, and did great service in preventing law-suits amongst them. If an industrious man suffered a loss, he delighted to make it good; if the harvest was bad, he was liberal in the remission of tithes. And all this he was enabled to do because his frugality was as great as his generosity; for his rectory was worth no more than £400 a year. The boldness which he could display at need is well illustrated by his action in regard to duelling. Finding one day a challenge-glove stuck up on the door of a church where he was to preach, he took it down with his own hand, and proceeded to the pulpit to inveigh against the unchristian custom.

A life of Bernard Gilpin, written by George Carleton bishop of Chichester, who had been a pupil of Gilpin's at Houghton, will be found in Bates's *Vitæ Selectorum aliquot Virorum*, etc., London, 1681. A translation of this sketch by William Freake, minister, was published at London 1629; and in 1852 it was reprinted in Glasgow, with an introductory essay by Edward Irving. It forms one of the lives in Christopher Wordsworth's *Ecclesiastical Biography* (vol. iii., 4th edit.), having been compared with Carleton's Latin text. Another biography of Gilpin, which, however, adds little to Bishop Carleton's, was written by William Gilpin, M.A., prebendary of Ailsbury, London, 1753, and 1854.

GILPIN, William (1724–1804), author of several works on the scenery of Great Britain, was born at Carlisle in 1724. He was educated at Oxford university, and, after holding for some time a small curacy in the north of England, established a school for sons of gentlemen at Cheam in Surrey. Among his pupils were Viscount Sidmouth, Lord Bexley, and Mitford, the author of the *History of Greece*, the last of whom presented him, when he had resolved to retire from teaching, with the living of Boldre, near the New Forest, Hampshire. Gilpin died there, April 5, 1804. He is author of a *Life of Bernard Gilpin*, several miscellaneous religious publications, and lives of a number of the Reformers, but is chiefly known for his works on the scenery of various parts of England and Scotland, illustrated by tasteful engravings in aquatint executed by himself.

The principal of these works are—*The River Wye and Southern Districts of Wales*, 1782; *The Lake Country*, 1789; *Observations on Picturesque Beauty made in the year 1776 in several parts of Great Britain, particularly the Highlands of Scotland*, 1778; two corresponding volumes on the *Lakes of Cumberland and Westmoreland; Forest Scenery*, 1791; *Three Essays on Picturesque Beauty, with a Poem on Landscape Painting*, 1782; *Essays on Prints and Early Engravings; Western Parts of England and Isle of Wight*, 1798; and *The Coasts of Hampshire, Sussex, and Kent*, published posthumously.

GIL VICENTE. See Vicente, Gil.

GIN, the name commonly given to an aromatized spirit for drinking, varieties of which are also known as Geneva, Hollands, and Schiedam. Gin is an abbreviation of Geneva, both being primarily derived from the French *genièvre* (juniper), from the fact that the characteristic flavoring ingredient of the spirit is juniper berries. Gin was originally and is still largely a Dutch compounded liquor, but it has long been a favorite stimulant beverage with the lower orders in London and other large English towns; and it is manufactured on a great scale by English rectifiers. As each separate distiller varies to some extent the materials and proportions of ingredients used in the preparation of gin, the varieties of the beverage are numerous; but generally a clear distinction exists between Hollands or Dutch gin and English gin. In the manufacture of Hollands a mash is prepared consisting of say 112 lb of malted bere or bigg and 228 lb of rye meal, with 460 gallons of water, at 162° Fahr. After infusion a proportion of cold water is added; and when the heat is reduced to about 80°, the whole, about 500 gallons, is run into the fermenting vat, to which about half a gallon of yeast is added. Fermentation speedily ensues, and in about two days the attenuation is complete, although at this stage nearly one-third of the saccharine matter in the liquor is undecomposed. The special features of the fermentation are the small proportion of yeast employed and the imperfect attenuation of the worts. The wash so obtained is distilled, and the resulting low wine is redistilled, with the addition of juniper berries and a little salt, sometimes with the addition of hops. Dutch gins vary much one from another, but generally they are much purer and mellower liquors than the more highly flavored and frequently adulterated British gins. Good qualities of the latter have as their basis plain grain spirit from the ordinary whisky distilleries, the following being an example of a mixture for distillation:—

| | |
|---|---|
| 300 gallons of low wines. | 47 lb crushed almond cake. |
| 650 " rectified spirit. | 2 " angelica root. |
| 95 lb juniper berries. | 6 " powdered liquorice. |
| 95 " corianders. | |

There is, however, much variation in the ingredients employed, and several other flavoring substances—notably cardamoms and cassia or cinnamon—are freely employed. A kind of gin is also prepared by mixing proportions of essential oils by agitation with plain spirits without any redistillation, and much inferior liquor is said to be made with oil of turpentine and aromatic substances without the use of juniper berries at all. To prevent the cloudiness or turbidity that would arise in these inferior beverages when mixed with water, they are fined with alum, potassium carbonate, acetate of lead, or sulphate of zinc. To give factitious pungency and mellowness to such drinks, grains of paradise and Cayenne pepper are freely used, and the absence of spirit is also covered by the use of sugar. What is known as cordial gin is usually more highly aromatized than the other varieties, and sweetened so that it really ought to be classed as a coarser liqueur. In thirty-eight spe-

cimens of gin examined by Dr. Hassall, the alcoholic strength of which ranged from 22·35 to 48·80 degrees, and the sugar present varied between 2·43 and 9·38 per cent., seven were found to contain Cayenne pepper, two had cinnamon or cassia oil, and nearly all contained sulphates. From the fact that the essential oil of juniper is the most powerful of all diuretics, gin is frequently prescribed in diseases of the urinary organs. Its beneficial effects in such cases is most marked; but, on the other hand, the grossly sophisticated liquors which are largely consumed under the name of gin are most detrimental in their effects. In the early part of the 18th century gin-shops multiplied with great rapidity in London, and the use of the beverage increased to an extent so demoralizing that retailers actually exhibited placards in their windows intimating that there people might get drunk for 1d., and that clean straw in comfortable cellars would be provided for customers. The legislature was obliged to interfere in order to try to curb the tide of debauchery, and what is known as the Gin Act was passed in 1736, under the provisions of which, dealers were prohibited from selling gin and other spirits in quantities less than 2 gallons without a license of £50, and an excise duty of 20s. was charged on each gallon. The operation of the Act, however, gave rise to much confusion, to illicit trade, and to gin riots, and after a lapse of seven years the statute was repealed.

GINCKELL, Godart van (1640–1703), first earl of Athlone, general, was born in Guelderland about 1630 or 1640. He was the head of an ancient and noble family, and bore the title of Baron van Reede. In his youth he entered the Dutch army, and in 1688 he followed William prince of Orange in his expedition to England. In the following year he distinguished himself by a memorable exploit—the pursuit, defeat, and capture of the Scottish regiment which had mutinied at Ipswich, and was marching across the fens to their native land. It was the alarm excited by this mutiny that facilitated the passing of the first Mutiny Act. In 1690 Ginckell accompanied William III. to Ireland, and commanded a body of Dutch cavalry at the battle of the Boyne. On the king's return to England, General Ginckell was entrusted with the conduct of the war. He took the field in the spring of 1691, and established his headquarters at Mullingar. Among those who held a command under him was the marquis of Ruvigny, the recognized chief of the Huguenot refugees. Early in June Ginckell took the fortress of Ballymore, capturing the whole garrison of 1000 men. The English lost only 8 men. After reconstructing the fortifications of Ballymore, the army marched to Athlone, then one of the most important of the fortified towns of Ireland. The Irish defenders of the place were commanded by a distinguished French general, Saint-Ruth. The firing began on June 19th, and on the 30th the town was stormed, the Irish army retreating towards Galway, and taking up their position at Aghrim. Having strengthened the fortifications of Athlone and left a garrison there, Ginckell led the English, on July 12th, to Aghrim. An immediate attack was resolved on, and, after a severe and at one time doubtful contest, the crisis was precipitated by the fall of Saint-Ruth, and the disorganized Irish were defeated and fled. A horrible slaughter of the Irish followed the struggle, and 4000 corpses were left unburied on the field, besides a multitude of others that lay along the line of the retreat. Galway next capitulated, its garrison being permitted to retire to Limerick. There the viceroy, Tyrconnel, was in command of a large force, but his sudden death early in August left the command in the hands of General Sarsfield and the Frenchman D'Usson. The English army came in sight of the town on the day of Tyrconnel's death, and the bombardment was immediately begun. Ginckell, by a bold device, crossed the Shannon and captured the camp of the Irish cavalry. A few days later he stormed the fort on Thomond Bridge, and after difficult negotiations a capitulation was signed, the terms of which were divided into a civil and a military treaty. Thus was completed the conquest or pacification of Ireland, and the services of the Dutch general were amply recognized and rewarded. He received the formal thanks of the House of Commons, and was created by the king first earl of Athlone and baron of Aghrim. The immense forfeited estates of the earl of Limerick were given to him, but the grant was a few years later revoked by the English parliament. The earl continued to serve in the English army, and accompanied the king to the Continent in 1693. He fought at Landen, and assisted in destroying the French magazine at Givet. In 1702 he took command of the Dutch serving under the duke of Marlborough. He died at Utrecht, February 10, 1703. On the death of the ninth earl without issue in 1844, the title became extinct.

GINGER (French, *Gingembre;* German, *Ingwer*), the rhizome or underground stem of *Zingiber officinale*, Roscoe, a perennial reed-like plant growing from 3 to 4 feet high. The flowers and leaves are borne on separate stems, those of the former being shorter than those of the latter, and averaging from 6 to 12 inches. The flowers themselves are borne at the apex of the stems in dense ovate oblong cone-like spikes from 2 to 3 inches long, composed of obtuse strongly-imbricated bracts with membranous margins, each bract enclosing a single small sessile flower. The leaves are alternate, bright green, smooth, tapering at both ends, with very short petioles. The plant, though unknown in a wild state, is considered, with very good reason, to be a native of the warmer parts of Asia, over which it has been cultivated from an early period, and the rhizome imported into England. From Asia the plant has spread into the West Indies, South America, western tropical Africa, and Australia.

The use of Ginger as a spice has been known from very early times; it was supposed by the Greeks and Romans to be a product of southern Arabia, and was received by them by way of the Red Sea; in India it has also been known from a very remote period, the Greek and Latin names being derived from the Sanskrit. Flückiger and Hanbury, in their *Pharmacographia*, give the following notes on the history of ginger. On the authority of Vincent's *Commerce and Navigation of the Ancients*, it is stated that in the list of imports from the Red Sea into Alexandria, which in the second century of our era were there liable to the Roman fiscal duty, ginger occurs among other Indian spices. So frequent is the mention of ginger in similar lists during the Middle Ages, that it evidently constituted an important item in the commerce between Europe and the East. It thus appears in the tariff of duties levied at Acre in Palestine about 1173, in that of Barcelona in 1221, Marseilles in 1228, and Paris in 1296. Ginger seems to have been well known in England even before the Norman Conquest, being often referred to in the Anglo-Saxon leech-books of the 11th century. It was very common in the 13th and 14th centuries, ranking next in value to pepper, which was then the commonest of all spices, and costing on an average about 1s. 7d. per lb. Three kinds of ginger were known among the merchants of Italy about the middle of the 14th century:—(1.) *Belledi* or *Baladi*, an Arabic name, which, as applied to ginger, would signify country or wild, and denotes common ginger; (2.) *Colombino*, which refers to Columbum, Kolam, or Quilon, a port in Travancore, frequently mentioned in the Middle Ages; and (3.) *Micchino*, a name which denoted that the spice had been brought from or by way of Mecca. Marco Polo seems to have seen the ginger plant both in India and China between 1280 and 1290. John of Montecorvino, a missionary friar who visited India about 1292, gives a description of the plant, and refers to the fact of the root being dug up and transported. Nicolo di Conto, a Venetian merchant in the early part of the 15th century, also describes the plant and the collection of the root, as seen by him in India. Though the Venetians received ginger by way of Egypt, some of the superior kinds were taken from India overland by the Black Sea. The spice is said to have been introduced into America by Francisco de Mendoça, who took it from the East Indies to New Spain. It seems to have been shipped for commercial purposes from San Domingo as early as 1585, and from Barbados in 1654; so early as 1547 considerable quantities were sent from the West Indies to Spain.

Ginger is known in commerce in two distinct forms, termed respectively coated and uncoated ginger, as having or wanting the epidermis. For the first, the pieces, which are called "races" or "hands," from their irregular palmate form, are washed and simply dried in the sun. In this form ginger presents a brown, more or less irregularly wrinkled or striated surface, and when broken shows a dark brownish fracture, hard, and sometimes horny and resinous. To produce uncoated ginger the rhizomes are washed, scraped, and sun-dried, and are often subjected to a system of bleaching, either from the fumes of burning sulphur or by

immersion for a short time in a solution of chlorinated lime. The whitewashed appearance that much of the ginger has, as seen in the shops, is due to the fact of its being washed in whiting and water, or even coated with sulphate of lime. This artificial coating is supposed by some to give the ginger a better appearance; it often, however, covers an inferior quality, and can readily be detected by the ease with which it rubs off, or by its leaving a white powdery substance at the bottom of the jar in which it is contained. Uncoated ginger, as seen in trade, varies from single joints an inch or less in length to flattish irregularly branched pieces of several joints, the "races" or "hands," and from 3 to 4 inches long; each branch has a depression at its summit showing the former attachment of a leafy stem. The color, when not whitewashed, is a pale buff; it is somewhat rough or fibrous, breaking with a short mealy fracture, and presenting on the surfaces of the broken parts numerous short bristly fibres.

The British market derives its supply of ginger from various parts of the world. The principal sorts, however, or those most commonly found in commerce, are Jamaica, Cochin, Bengal, and African, though each of these in its turn has its several varieties and qualities. The best or most valued kind of all is the Jamaica, and next to it the Cochin. For ordinary purposes uncoated ginger is considered the best; the largest and finest pieces, of a pale buff color both outside and inside, and cutting softly and evenly, are considered the most valuable. The chief sources of supply are the East and West Indies, Sierra Leone, and Egypt.

The principal constituents of ginger are starch, volatile oil (to which the characteristic odor of the spice is due), and resin (to which is attributed its pungency). Its chief use is as a condiment or spice, but as an aromatic and stomachic medicine it is also used internally. "The stimulant, aromatic, and carminative properties render it of much value in atonic dyspepsia, especially if accompanied with much flatulence, and as an adjunct to purgative medicines to correct griping." Externally applied as a rubefacient, it has been found to relieve headache and toothache. The rhizomes, collected in a young green state, washed, scraped, and preserved in syrup, form a delicious preserve, which is largely exported both from the West Indies and from China. Cut up into pieces like lozenges, and preserved in sugar, ginger also forms a very agreeable sweetmeat.
(J. R. J.)

GINGHAM is a woven cotton fabric, of a close stoutish texture, the distinguishing characteristics of which are that it is a plain (*i. e.*, untwilled) cloth, woven into yarn-dyed stripes or checks of two or more colors. In some cases as many as seven or eight colors are introduced in the warp and weft of a gingham; but no patterns are made that cannot be woven in a common plain loom. Gingham was originally an Indian product, but its manufacture was early introduced into the Lancashire and Glasgow districts; and during the first half of the present century the trade formed an important feature in the textile industries of the latter locality—the demand for the fabric coming chiefly from the United States and the West Indies. The trade distinction of gingham is now to a large extent superseded by other terms.

GINGUENÉ, Pierre Louis (1748–1815), the author of the *Histoire littéraire d'Italie*, was born on 25th April, 1748, at Rennes in Brittany. He was educated at a Jesuit college in his native town, but he owed most of his literary tastes and accomplishments to his father, who early imbued him with a love of music and the languages of England and Italy. His first literary effort, a poetical piece entitled *Confession de Zulmé*, brought him into notice among the literary coteries of Paris, from the circumstance that, when published at first anonymously, it was claimed by six or seven different authors. Though the value of the piece is not very great, it is Ginguené's poetical *chef d'œuvre*. The part he took as a defender of Piecini against the partisans of Gluck made him still more widely known; and the reputation he acquired as a promising political writer secured employment for him in the public service in 1780. He hailed, however, the first symptoms of the Revolution, joined Rabaut, St. Étienne, and Cerutti in producing the *Feuille Villageoise*, and celebrated in an indifferent ode the opening of the states-general. A more creditable effort was his *Lettres sur les Confessions de J. J. Rousseau*, 1791, in which he defended to the uttermost the life and principles of his author. Refusing to countenance the excesses of the Revolution, he was thrown into prison, whence he only escaped with life by the downfall of Robespierre. Some time after his liberation he assisted, as director-general of the "commission exécutive de l'instruction publique," in reorganizing the system of public instruction. When the Institute was established in 1796, he was elected a member of the division called the academy of moral and political sciences. In 1798 the directory appointed him minister plenipotentiary to the king of Sardinia, whose ruin, begun by force of arms, they had determined to complete by treachery. A less promising tool could not have been found for carrying out their design. After fulfilling his duties for seven months, very little to the satisfaction of his employers, Ginguené retired to his country house of St. Prix, in the valley of Montmoreney, and there he prosecuted his literary labors till the Revolution of the 18th Brumaire called him once more before the world. He was appointed a member of the tribunate, which made a show of maintaining democratic opposition to the first consul; but Napoleon, finding that he was not sufficiently tractable, had him expelled at the first "purge," and Ginguené once more joyfully returned to his favorite pursuits. These were now more than ever a necessity of life to him, as his only other source of income was the small endowment attached to his seat in the Institute. Fortunately he was nominated one of the commission charged to continue the literary history of France, which had been brought down by the Benedictines to about the close of the 12th century; and the three volumes of this series which appeared in 1814, 1817, and 1820 are for the most part the result of his labors. But the work by which Ginguené will be longest remembered is his *Histoire littéraire d'Italie* (9 vols. 8vo, 1811–1819), to which he was putting the finishing touches when he was cut off by a painful disease, November 16, 1815. The first six volumes appeared before their author's death; the seventh is entirely his except a few pages; and of the eighth and ninth he wrote about a half, the other half being composed by Salfi, and revised by Daunou. The success of the history in Italy was astonishing: editions were published in various parts of the peninsula, with notes and comments by the best scholars, and three translations appeared respectively at Milan, Naples, and Venice.

Ginguené was originally led to make Italian literature his special study by finding how ill that subject was understood, and how little it was appreciated, by his countrymen. In the composition of his history he was guided for the most part by the great work of the Jesuit Tiraboschi, but he avoids the prejudices and party views of his model. His own style, though occasionally forcible and eloquent, is not unfrequently too tame for the subject, and he often trespasses on his reader's patience by over-minuteness of detail: but these faults are more than atoned for by fine critical discernment, impartiality, and freedom. On the score of accuracy, indeed, Ginguené sometimes offends, but seldom in matters of great moment; and his slips are such as are almost inevitable to a foreigner, who could hardly be said to have even seen the country whose literary history he relates. The Italians felt grateful to him for having placed their literature in its proper light, and readily forgave the excessive eulogies which he passed on many of their writers, whose very names had been forgotten in their own country.

During the latter years of his life Ginguené wrote extensively for the press, and he edited the *Décade philosophique, politique, et littéraire*, till it was suppressed by Napoleon in 1807. He contributed largely to the *Biographie universelle*, the *Mercure de France*, and the *Encyclopédie méthodique;* and he edited the works of Chamfort and of Lebrun. Among his minor productions are an opera, *Pomponin ou le Tuteur mystifié*, 1777; *La Satire des Satires*, 1778; *De l'autorité de Rabelais dans la révolution présente*, 1791; *D. M. Neckar*, 1795; *Fables inédites*, 1814. See "Éloge de Ginguené," by Dacier, in the *Mémoires de l'Institut*, tom. vii.; "Discours" by M. Daunou, prefixed to the 2d edit. of the *Hist. litt. d'Italie;* D. J. Garat, *Notice sur la vie et les ouvrages de P. L. Guingené*, Paris, 1817.

GINSENG, the root of a species of *Panax* (*P. Ginseng*, Meyer), belonging to the natural order *Araliaceæ*, is a very celebrated Chinese medicine. The demand is so great that many other roots are substituted for it, notably that of *Panax quinquefolium*, Linn., distinguished as American ginseng, and imported from the United States. At one time the ginseng obtained from Manchuria was considered to be the finest quality, and in consequence became so scarce that an imperial edict was issued prohibiting its collection. That

prepared in Corea is now the most esteemed variety. The root of the wild plant is preferred to that of cultivated ginseng, and the older the plant the better is the quality of the root considered to be. Lockhart states that all the ginseng collected in the Chinese empire is imperial property, and is sold to those who have the privilege of dealing in it at its weight in gold. Great care is taken in the preparation of the drug. The account given by Kæmpfer of the preparation of nindsin, the root of *Sium ninsi*, Thunb., in the Corea, will give a good idea of the preparation of ginseng, ninsi being a similar drug of supposed weaker virtue, obtained from a different plant, and often confounded with ginseng. "In the beginning of winter nearly all the population of Sjansai turn out to collect the root, and make preparations for sleeping in the fields. The root, when collected, is macerated for three days in fresh water, or water in which rice has been boiled twice; it is then suspended in a closed vessel over the fire, and afterwards dried, until from the base to the middle it assumes a hard, resinous, and translucent appearance, which is considered a proof of its good quality."

Ginseng of good quality generally occurs in hard, rather brittle, translucent pieces, about the size of the little finger and varying in length from 2 to 4 inches. The taste is mucilaginous, sweetish, and slightly bitter and aromatic. The root is frequently forked, and it is probably owing to this circumstance that medicinal properties were in the first place attributed to it, its resemblance to the body of a man being supposed to indicate that it could restore virile power to the aged and impotent. In price it varies from 6 or 12 dollars to the enormous sum of 300 or 400 dollars an ounce. Root of this quality can of course only be purchased by the most wealthy, and the greatest care is taken of such pieces by the vendors.

Lockhart gives a graphic description of a visit to a ginseng merchant. Opening the outer box, the merchant removed several paper parcels which appeared to fill the box, but under them was a second box, or perhaps two small boxes, which, when taken out, showed the bottom of the large box and all the intervening space filled with more paper parcels. These parcels, he said, "contained quicklime, for the purpose of absorbing any moisture and keeping the boxes quite dry, the lime being packed in paper for the sake of cleanliness. The smaller box, which held the ginseng, was lined with sheet-lead; the ginseng further enclosed in silk wrappers was kept in little silken-covered boxes. Taking up a piece, he would request his visitor not to breathe upon it, nor handle it; he would dilate upon the many merits of the drug and the cures it had effected. The cover of the root, according to its quality, was silk, either embroidered or plain cotton cloth, or paper." In China the ginseng is often sent to friends as a valuable present; in such cases, "accompanying the medicine is usually given a small, beautifully-finished double kettle, in which the ginseng is prepared as follows. The inner kettle is made of silver, and between this and the outside vessel, which is a copper jacket, is a small space for holding water. The silver kettle, which fits on a ring near the top of the outer covering, has a cup-like cover in which rice is placed with a little water; the ginseng is put in the inner vessel with water, a cover is placed over the whole, and the apparatus is put on the fire. When the rice in the cover is sufficiently cooked, the medicine is ready, and is then eaten by the patient, who drinks the ginseng tea at the same time." The dose of the root is from 60 to 90 grains. During the use of the drug tea-drinking is forbidden for at least a month, but no other change is made in the diet. It is taken in the morning before breakfast, from three to eight days together, and sometimes it is taken in the evening before going to bed.

At one time it was proposed by some Russians to establish ginseng plantations, with the view of growing the root as an important article of trade with China. Ginseng is also cultivated in Japan, having been introduced from Corea; but, although it grows more luxuriantly there than in its native country, the root is considered to be much less active. This may be due to the fact that, while in the mountains of Corea the root is perennial, in Japan the plant runs to seed the first year, and becomes annual. Europeans have hitherto failed to discover any remarkable properties in the drug. Dr. Porter Smith, however, mentions having seen some cases in which life appeared to be prolonged for a time by its use; and M. Maack states that one of the Cossacks of his party, having chopped off a finger accidentally with an axe, applied ointment made from ginseng, and the wound healed rapidly. Its properties, which may be likened to those of the mandrake of Scripture, are perhaps dependent in great measure upon the faith of the patient.

GIOBERTI, Vincenzo (1801–1852), the ablest philosophical writer of modern Italy, and one of the most interesting actors in the recent history of the country, was born in Turin on the 5th April, 1801, the only child of parents in moderate circumstances there, and was educated by the fathers of the Oratory with a view to the priesthood, to which he was ordained in 1825. His study of the ancient philosophers, and the fathers and doctors of the church, occupied him for years, during which he led a very retired life; gradually, however, he took more and more interest in the affairs of his country, as well as in the literature of the day, entering warmly into the new ideas then beginning to be discussed in connection with politics. The freedom of Italy from foreign masters became his ruling motive in life, and this freedom in his conception of it was an emancipation, not only from armed masters, but from modes of thought alien to its genius, and detrimental to its European authority. This authority was in his mind connected with papal supremacy, though in a way quite novel—intellectual rather than political. One must remember this in considering nearly all his writings, and also in estimating his position, both in relation to the ruling clerical party—the Jesuits—and also in relation to the politics of the court of Piedmont after the accession of Charles Albert in 1831. He was now noticed by the king and made one of his chaplains. His popularity and private influence, however, were reasons enough for the court party to mark him for exile; he was not one of them, and could not be depended on. Knowing this, he in 1833 asked permission to resign his chaplaincy, but was suddenly arrested while walking with a friend in the public gardens, and after an imprisonment of four months, sent out of the country in the escort of a carabineer, under decree of banishment. This was done without trial or process—simply, it would appear, by private influence of the clerical party, his name being at the same time struck off the list of theological doctors of the college of Turin. With broken fortunes and ruined plans Gioberti arrived in Paris in the beginning of October, 1833. A year later he went to Brussels, where he spent the best period of his life from that time to 1845, teaching philosophy, and assisting in the work of a college superintended by his friend Gaggia, yet finding time, by rising early and sitting late, to write many works of great importance in philosophical inquiry, but bearing a special relation to his country and its position. His spirits never returned to him, however, as his whole being was bound up with the welfare of his native country. An amnesty having been passed by Charles Albert in 1846, Gioberti had liberty to return to Italy, just as Pius IX. in the beginning of his pontificate manifested strongly liberal sympathies. Gioberti took no step, however, till the end of 1847, and did not return to his native land till after certain negotiations, and the public expression of popular enthusiasm in his favor. On his entrance into Turin, 29th April, 1848, there was a general outburst of this enthusiasm, mainly caused, it appears, by his unjust banishment and by the large circulation of his books, especially the *Gesuita Moderno*. The city was illuminated; deputations waited upon him; the king made him senator, but, having been returned both by Turin and by Genoa as deputy to the assembly of representatives, now first meeting under the new constitution, he elected to sit in the lower chamber, for his native town. Previous to the opening he made a tour in various provinces, beginning at Milan and including Rome, where he had three interviews with the liberal pope, who at that moment seemed to be the representative of his ideal imagined in the work *Del Primato morale e civile*, which Pius had read and admired. While he was engaged in this tour, constantly addressing the people publicly, the chamber met and elected him president. In the same parliament sat Azeglio, Cavour, and other liberals, and Balbo was prime minister. At the close of the same eventful year, a new ministry was formed, headed by Gioberti; but with the accession of Victor Emmanuel in March, 1849, his active life came to an end. For a short time, indeed, he held a seat in the cabinet, though without a portfolio; but an irreconcilable disagreement soon followed, and his removal from

Turin was accomplished by his appointment on a mission to Paris, whence he never returned. There, refusing the pension which had been offered him and all ecclesiastical preferment, he lived frugally, and spent his days and nights as at Brussels in literary labor. Many other exiles gathered about him, and the Marquis Pallavicino became his bosom friend. He died suddenly, of apoplexy, on the 26th October, 1852.

Gioberti's writings are more important than his political career. In the general history of European philosophy they stand apart. As the speculations of Rosmini, against which he wrote, have been called the last link added to mediæval thought, so the system of Gioberti, more especially in his greater and earlier works, is unrelated to other modern schools of thought. It shows a harmony with the Roman Catholic faith which caused Cousin to make the superficial criticism that "Italian philosophy was still in the bonds of theology." Method is with him a synthetic, subjective, and psychological instrument. He reconstructs, as he declares, ontology, and begins with the "ideal formula," "the Ens creates ex nihilo the existent." He is in some respects a Platonist, and transplants certain dogmata from the ancient idealist. He identifies religion with civilization, and arrives in his treatise *Del Primato morale e civile degli Italiani* at the conclusion that the church is the axis on which the well-being of human life revolves. His later works, the *Rinnovamento* and the *Protologia*, are sometimes thought to be less affirmative in this matter, and there is a division in opinion among his critics how far he shifted his ground under the influence of events before he died. His first work, written when he was thirty-seven, had a personal reason for its existence. A young fellow-exile and friend, Paolo Pallia, having many doubts and misgivings as to the reality of revelation and a future life, Gioberti at once set to work with *La Teorica del Sovrannaturale*, which was his first publication (2 vols., 1838). After this the enormous labors of his pen made up for the lateness of his commencement as an author. Philosophical treatises in two or three volumes, which would occupy, generally speaking, half a lifetime, followed in rapid succession, each one being a corollary to the last. The *Teorica* was followed by *Introduzione allo Studio della Filosofia* in three volumes, passing through the press in 1839–40. In this work he states his reasons for requiring a new method and new terminology. Here he brings out the doctrine that religion is the direct expression of the *idea* in this life, and is one with true civilization in history. Civilization is a conditioned mediate tendency to perfection, to which religion is the final completion if carried out; it is the end of the second cycle expressed by the second formula, the Ens redeems existences. Essays on the lighter and more popular subjects, *Del Bello* and *Del Buono*, followed the *Introduction*, but were not published as a volume till 1846, having first appeared in connection with the writings of other authors. *Del Primato morale e civile degli Italiani* and the *Prolegomeni* to the same, and soon afterwards his triumphant exposure of the Jesuits, *Il Gesuita Moderno*, in five successive volumes (eight volumes altogether), began to be issued in 1843, and no doubt hastened the transfer of rule from clerical to civil hands. It was, as has been seen, the popularity of these semi-political works, heightened by other occasional political articles which fill two volumes, and by his *Rinnovamento civile d'Italia*, that caused Gioberti to be welcomed with such enthusiasm on his return to his native country. All these works were perfectly orthodox, and aided in drawing the liberal clergy into the movement which has resulted since his time in the unification of Italy. The Jesuits, however, closed round the pope more firmly after his return to Rome, and in the end Gioberti's writings were placed on the *Index*, although with no unfavorable result as far as their influence is concerned. The remainder of his works need not be particularized, although they give his mature views on many points, especially *La Filosofia della Rivelazione* and the *Protologia*. The entire writings of Gioberti, including those left in manuscript, have been carefully edited by Giuseppe Massari in thirty-six volumes.

See Massari, *Ricordi Biografici e Carteggio* (Naples, 1863); *Lettere di Vincenzo Gioberti e Giorgio Pallavicino* (Milan, 1875); Rev. C. B. Smyth, *Christian Metaphysics* (London, 1851).

GIOJA, Melchior (1767–1828), a distinguished Italian writer on philosophy and political economy, was born at Piacenza in 1767. He was educated at the celebrated college of St. Lazare in his native town, and showed special fondness for the philosophical sciences. Apparently he had been destined for the church, but he seems to have given up at an early period the study of theology, and after completing his course at the college spent some years in retirement. His first work was the philosophical treatise *Il nuovo Galateo* (1802), which was followed by the *Logica Statistica*. The arrival of Napoleon in Italy drew Gioja into public life. He advocated warmly the establishment of a republican government, and under the Cisalpine Republic he was named historiographer and director of statistics. After the fall of Napoleon he retired into private life, and does not appear again to have held office. He died in 1828. Gioja's fundamental idea is the value of statistics or the collection of facts. Philosophy itself is with him classification and consideration of ideas. Logic he regarded as a practical art, and his *Esercizioni Logici* has the further title, *Art of deriving benefit from ill-constructed books*. In ethics Gioja follows Bentham, and his large treatise *Del Merito e delle Recompense*, 1818, is a clear and systematic view of social ethics from the utilitarian principle. In political economy this avidity for facts produced better fruits. The *Nuovo Prospetto delle Scienze Economiche*, 6 vols., 1815–17, although long to excess, and overburdened with classifications and tables, contains much valuable material. In particular, Gioja must be credited with the finest and most original treatment of division of labor since the *Wealth of Nations*. Much of what Babbage taught later on the subject of combined work is anticipated by Gioja. His theory of production is also deserving of attention from the fact that it takes into account and gives due prominence to immaterial goods. Throughout the work there is continuous opposition to Smith. Gioja's latest work *Filosofia della Statistica*, 1828, contains in brief compass the essence of his ideas on human life, and affords the clearest insight into his aim and method in philosophy both theoretical and practical.

A notice of Gioja's life is given in the 2d edition of the *Filosofia della Statistica*, 1829. See Ferri, *Essai sur l'histoire de la Phil. en Italie au 19me Siècle*, 1869.

GIORDANO, Luca (1632–1705), a painter of great immediate celebrity, was born in Naples, son of a very indifferent painter, Antonio, who imparted to him the first rudiments of drawing. Nature predestined him for the art, and at the age of eight he painted a cherub into one of his father's pictures, a feat which was at once noised abroad, and which induced the viceroy of Naples to recommend the child to Spagnoletto. His father afterwards took him to Rome, to study under Pietro da Cortona. He acquired the nickname of Luca Fa-presto (Luke Work-fast). One might suppose this nickname to be derived merely from the almost miraculous celerity with which from an early age and throughout his life he handled the brush; but it is said to have had a more express origin. The father, we are told, poverty-stricken and greedy of gain, was perpetually urging his boy to exertion with the phrase, "Luca, fà presto." The youth obeyed his parent to the letter, and would actually not so much as pause to snatch a hasty meal, but received into his mouth, while he still worked on, the food which his father's hand supplied. He copied nearly twenty times the Battle of Constantine by Julio Romano, and with proportionate frequency several of the great works of Raphael and Michelangelo. His rapidity, which belonged as much to invention as to mere handiwork, and his versatility, which enabled him to imitate other painters deceptively, earned for him two other epithets, "The Thunderbolt" (Fulmine), and "The Proteus," of Painting. He shortly visited all the main seats of the Italian school of art, and formed for himself a style combining in a certain measure the ornamental pomp of Paul Veronese and the contrasting compositions and large schemes of chiaroscuro of Pietro da Cortona. He was noted also for lively and showy color. Returning to Naples, and accepting every sort of commission by which money was to be made, he practised his art with so much applause that Charles II. of Spain towards 1687 invited him over to Madrid, where he remained thirteen years. Giordano was very popular at the Spanish court, being a sprightly talker along with his other marvellously facile gifts, and the king created him a cavaliere. One anecdote of his rapidity of work is that the queen of Spain having one day made some inquiry about his wife, he at once showed Her Majesty what the lady was like by painting her portrait into the picture on which he was engaged. After the death of Charles in 1700 Giordano, gorged with wealth, returned to Naples. He spent large sums in acts of munificence, and was particularly liberal to his poorer brethren of the art. He again visited various parts of Italy, and died in Naples on 12th January, 1705, his last words being "O Napoli, sospiro mio" (O Naples, my heart's love!). One of his maxims was that the good painter is the one whom the public like, and that the public are attracted more by color than by design.

At the present day, when the question is not how quickly Giordano could do his work, but what the work itself

amounts to, his reputation has run down like the drops of heavy rain off a window, or like one of the figures in his own paintings, in which he was wont to use an excessive quantity of oil. His astonishing readiness and facility must, however, be recognized, spite of the general commonness and superficiality of his performances. He left many works in Rome, and far more in Naples. Of the latter one of the most renowned is Christ expelling the Traders from the Temple, in the church of the Padri Girolamini, a colossal work, full of expressive lazzaroni; also the frescoes of S. Martino, and those in the Tesoro della Certosa, including the subject of Moses and the Brazen Serpent; and the cupola-paintings in the Church of S. Brigida, which contains the artist's own tomb. In Spain he executed a surprising number of works,—continuing in the Escorial the series commenced by Cambiasi, and painting frescoes of the Triumphs of the Church, the Genealogy and Life of the Madonna, the stories of Moses, Gideon, David, and Solomon, and the Celebrated Women of Scripture, all works of large dimensions. His pupils, Aniello Rossi and Matteo Pacelli, assisted him in Spain. In Madrid he worked more in oil-color, a Nativity there being one of his best productions. Another superior example is the Judgment of Paris in the Berlin Museum. In Florence, in his closing days, he painted the Cappella Corsini, the Galleria Riccardi, and other works. In youth he etched with considerable skill some of his own paintings, such as the Slaughter of the Priests of Baal. He also painted much on the crystal borderings of looking-glasses, cabinets, etc., seen in many Italian palaces, and was, in this form of art, the master of Pietro Garofolo. His best pupil, in painting of the ordinary kind, was Paolo de Matteis.

GIORGIONE (1477–1511), the name adopted both by his contemporaries and by posterity for one of the most renowned of Italian painters, signifies George the Big, or Great, and was given him, according to Vasari, "because of the gifts of his person and the greatness of his mind." Like Lionardo da Vinci, Giorgione appears to have been of illegitimate birth. His father belonged certainly to the gentle family of the Barbarella, of Castelfranco in the Trevisan; his mother, it seems probable, was a peasant girl of the neighboring village of Vedelago; and he was born in or shortly before the year 1477. In histories and catalogues he is now commonly styled Giorgio Barbarella of Castelfranco; but it seems clear that he was humbly reared, and only acknowledged by his father's family when his genius had made him famous. Twenty-seven years after his death, the brothers Matteo and Ercole Barbarella were glad to inscribe the name of Giorgione among the members of their family in whose honor they built and dedicated a monument in the church of San Liberale in their native town. Presently this church was demolished and replaced by a new one. In the course of this operation the inscription in question perished. Not so a more important memorial of Giorgione's greatness, in the shape of an altar-piece which he painted for the same church on the commission of Tuzio Costanzo. Tuzio Costanzo was a famous captain of free lances, who had followed his mistress, the Queen Cornaro, from Cyprus to her retirement in the Trevisan, and at the beginning of the 16th century was settled at Castelfranco. The altar-piece with which Giorgione adorned the chapel of this patron in the old church of San Liberale, was afterwards transferred to the new church, where it remains to this day, so that there is something more than the mere memory of the great painter to attract the lover of art on a pilgrimage to his native town. Castelfranco is a hill fort standing in the midst of a rich and broken plain at some distance from the last slopes of the Venetian Alps. Giorgione's ideal of luxuriant pastoral scenery, the country of pleasant copses, glades, and brooks, amid which his personages love to wander or recline with lute and pipe, was derived, no doubt, from these natural surroundings of his childhood. We cannot tell how long he remained in their midst, nor what were the circumstances which led him, while still, it seems, a boy, to Venice. Once there, we do not hear of him until his genius is, so to speak, full-fledged. He appears all at once as a splendid presence, the observed of all observers; an impassioned musician, singer, lover; and, above all, as a painter winning new conquests for his art. His progress from obscurity to fame, probably under the teaching of Giovanni Bellini, must have been extraordinarily rapid, as he was still very young when he was employed to paint the portraits of two successive doges, and of great captains and princesses such as Gonzalvo of Cordova and Catharina Cornaro. Giorgione effected, in the Venetian school, a change analogous to that effected by Lionardo in the school of Florence,—a change, that is, which was less a revolution than a crowning of the edifice. He added the last accomplishments of freedom and science to an art that at his advent only just fell short of both. Venetian painting towards 1495 had reached the height of religious dignity in the great altar-pieces of Bellini, the height of romantic sentiment and picturesque animation in Carpaccio's series from the legend of St. Ursula. The efforts of the school for nearly half a century had been concentrated on the development, with the help of the new medium of oil, of color as the great element of emotional expression in painting. Giorgione came to enrich the art with a more faultless design; with a system of color yet more ardent, melting, and harmonious; with a stronger sense of life and of the glory of the real world as distinguished from the solemn dreamland of the religious imagination. He had a power hitherto unknown of interpreting both the charm of merely human grace and distinction, and the natural joy of life in the golden sunlight among woods and meadows. His active career cannot have extended over more than fifteen years, since we know that he died in 1511—according to one account, of a contagious disorder; according to another, of grief at discovering that his mistress had played false with a pupil. But in that brief career he had both deeply modified the older manner of the Venetian school, as represented even by a master so great and so austere as John Bellini, and had prepared the way for its final manner, as represented by the most complete master of all, Titian. Bellini, who outlived Giorgione, had not been ashamed to learn something from the practice of a teacher fully forty years younger than himself, who was probably in the first instance his own pupil. Titian, only ten years younger than Giorgione, succeeded to his conquests, and enjoyed the length of days which was denied him.

A consecutive biography of Giorgione it is impossible to construct, either from literary records or from extant works. The literary records only furnish us with a few general characteristics, and with the mention of a few of his productions, especially the frescoes with which he adorned the front of the Fondaco dei Tedeschi or hall of the German traders of Venice, after its destruction by fire in 1504; and the frescoes and altar-piece, sometimes attributed to the same year, which he executed for Tuzio Costanzo in his native town. The decorations of the Fondaco dei Tedeschi, which Vasari praises for their design and glowing color, but blames for their too fantastic and enigmatical invention, have unhappily been utterly destroyed by the combined operation of weather and of reckless architectural changes in the building. The frescoes of the chapel of Castelfranco were also sacrificed, while the altar-piece was preserved in the manner we have related. A fragment of a love-madrigal, which was once to be read on the back of the panel, addressed apparently by the painter to his model, is quoted as in character with our traditions of the man. The picture itself represents the Virgin and Child enthroned, with a group of saints, and prominent among them the warrior-saint Liberale, the patron of the church. A small and highly-finished study in armor for this figure is now one of the treasures of the National Gallery in London, to which it was bequeathed by Mr. Rogers. To Giorgione are also attributed pictures in almost all the public and private galleries of Europe, to a number ten times greater than could possibly be consistent with the short duration of his career, and with the fact that no inconsiderable portion of that career must have been occupied with the production of the perished frescoes. These so-called Giorgiones of the galleries may to some extent be recognized and classified as the work of one or another of several groups of painters whose manner was more or less akin to, or influenced by, that of Venice in Giorgione's days. One such group belongs to Bergamo; another to Brescia; another is in alliance with Palma; another with Titian; another, again, consists of the later and looser imitators of the master himself, as Andrea and Schiavone, Pietro della Vecchia and Rocco Marcone. It is probable, indeed, that those distinguished authorities, Messrs. Crowe and Cavalcaselle, have gone too far in excluding from the genuine work of Giorgione several of the most famous pictures which have hitherto passed as standards whereby

to judge his manner, as, for instance, the Entombment of Christ at Treviso, and particularly the beautiful Concert of the Louvre. Without, however, entering upon disputed ground, there remains a reasonable number of undoubted pictures of the master, and these, while they possess in common the qualities of feeling and invention which we have above defined, in technical style vary from a minute and painstaking precision, almost like that of Antonello da Messina, or of Bellini in his earlier manner, to a degree of breadth, glow, and softness, which are the qualities more popularly associated with the name of Giorgione, and more commonly attempted by his imitators.

We conclude with a mention of a few of the principal undisputed examples of Giorgione's handiwork, following a chronological order, which, however, it should be understood, is necessarily but approximate and conjectural. Florence, Uffizi: an Ordeal of Moses, and a Judgment of Solomon,—small pictures with rich landscape accessories, and figures of extraordinary grace and delicacy, painted apparently in imitation or in rivalry of the New Testament allegory by Bellini, in the same manner, which is preserved in the same gallery; all three were originally in the summer residence of the Medici at Poggio Imperiale. London, collection of Mr. Wentworth Beaumont: Holy Family, with the angel appearing to the shepherds, in the background, —again a small picture, very delicately finished; formerly in the possession of Cardinal Fesch. London, National Gallery: the Study for San Liberale above mentioned. Castelfranco, Church of San Liberale: the altar-piece,—figures life size, exhibiting much of the manner of Bellini in his altar-pieces. Vienna, Belvidere Gallery: a Group of Astronomers in a Glade, known as the Chaldeans,—rich sunset landscape, with villages in the distance and trees in the foreground; beside the trees on the left, three figures in Oriental costumes, one-third of life size; formerly in the Taddeo Contarini gallery. Venice, Manfrini palace: man, woman, and child, known as the Family of Giorgione, in a landscape recalling the neighborhood of Castelfranco,—one of the most beautiful works of the master, formerly in the house of Gabriel Vendramin at Santa Fosca. England, Kingston Lacy, collection of Mr. Bankes: Judgment of Solomon,—a large unfinished picture of great beauty, of clearer tones and broader treatment than the foregoing, bought, at the suggestion of Lord Byron, from the Marescalchi gallery. Florence, Pitti: Concert,—a monk of the Augustinians, seated at the harpsichord; behind him, a clerk with a viol; on the left a young man with plumed hat and long hair. This is the most perfect of all the works which are assumed to belong to the later time of the master.

See Vasari, *Vite de' più excellenti pittori*, etc., vol. vii. p. 80, ed. Lemonnier; Ridolfi, *Maraviglie dell' Arte*, vol. i. p. 121; Crowe and Cavalcaselle, *History of Painting in North Italy*, vol. ii. p. 119. (S. C.)

GIOTTINO (1324–1357), an early Florentine painter. Vasari is the principal authority in regard to this artist; but it is not by any means easy to bring the details of his narrative into harmony with such facts as can be verified at the present day. It would appear that there was a painter of the name of Tommaso (or Maso) di Stefano, termed Giottino; and the Giottino of Vasari is said to have been born in 1324, and to have died early, of consumption, in 1357—dates which must be regarded as open to considerable doubt. Stefano, the father of Tommaso, was himself a celebrated painter in the early revival of art; his naturalism was indeed so highly appreciated by contemporaries as to earn him the appellation of "Scimia della Natura" (ape of nature). He, it seems, instructed his son, who, however, applied himself with greater predilection to studying the works of the great Giotto, formed his style on these, and hence was called Giottino. It is even said that Giottino was really the son (others say the great-grandson) of Giotto. To this statement little or no importance can be attached. To Maso di Stefano, or Giottino, Vasari and Ghiberti attribute the frescoes in the chapel of S. Silvestro (or of the Bardi family) in the Florentine church of S. Croce; these represent the miracles of Pope St. Sylvester, as narrated in the Golden Legend, one conspicuous subject being the sealing of the lips of a malignant dragon. These works are animated and firm in drawing, with naturalism carried further than by Giotto. From the evidence of style, some modern connoisseurs assign to the same hand the paintings in the funeral vault of the Strozzi family, below the Cappella degli Spagnuoli in the church of S. Maria Novella, representing the crucifixion and other subjects. Vasari ascribes also to his Giottino the frescoes of the life of St. Nicholas in the lower church of Assisi. This series, however, is not really in that part of the church which Vasari designates, but is in the Chapel of the Sacrament; and the works in that chapel are understood to be by Giotto di Stefano, who worked in the second half of the 14th century—very excellent productions of their period. It might hence be inferred that two different men produced the works which are unitedly fathered upon the half-legendary "Giottino," the consumptive youth, solitary and melancholic, but passionately devoted to his art. A large number of other works have been attributed to the same hand; we need only mention an Apparition of the Virgin to St. Bernard, in the Florentine Academy; a lost painting, very popular in its day, commemorating the expulsion, which took place in 1343, of the duke of Athens from Florence; and a marble statue erected on the Florentine campanile. Vasari particularly praises Giottino for well-blended chiaroscuro. He left behind him various scholars in the art.

GIOTTO (1276–1336), relatively to his age one of the greatest and most complete of artists, fills in the history of Italian painting a place analogous to that which seems to have been filled in the history of Greek painting by Polygnotus. That is to say, he lived at a time when the resources of his art were still in their infancy, but considering the limits of those resources, his achievements were the highest possible. At the close of the Middle Age, he laid the foundations upon which all the progress of the Renaissance was afterwards securely based. In the days of Giotto, the knowledge possessed by painters of the human frame and its structure rested only upon general observation, and not upon any minute, prolonged, or scientific study; while to facts other than those of humanity their observation had never been closely directed. Of linear perspective they possessed few ideas, and those elementary and empirical, and scarcely any ideas at all of aerial perspective or the conduct of light and shade. As far as painting could ever be carried under these conditions, so far it was carried by Giotto. In its choice of subjects, his art is entirely subservient to the religious spirit of his age. Even in its mode of conceiving and arranging those subjects, it is in part still trammelled by the rules and consecrated traditions of the past. Thus, it is as far from being a perfectly free as from being a perfectly accomplished form of art. Many of those truths of nature to which the painters of succeeding generations learnt to give accurate and complete expression, Giotto was only able to express by way of imperfect symbol and suggestion. But in spite of these limitations and shortcomings, and although he has often to be content with expressing truths of space and form conventionally or inadequately, and truths of structure and action approximately, and truths of light and shadow not at all, yet among the elements over which he has control he maintains so just a balance that his work produces in the spectator less sense of imperfection than that of many later and more accomplished masters. He is one of the least one-sided of artists, and his art, it has been justly said, resumes and concentrates all the attainments of his time not less truly than all the attainments of the crowning age of Italian art are resumed and concentrated in Raphael. In some particulars the painting of Giotto was never surpassed,—in the judicious division of the field and massing and scattering of groups,—in the union of dignity in the types with appropriateness in the occupations of the personages,—in strength and directness of intellectual grasp and dramatic motive,—in the combination of perfect gravity with perfect frankness in conception, and of a noble severity in design with a great charm of harmony and purity in color. The earlier Byzantine and Roman workers in mosaic had bequeathed to him the high abstract qualities of their practice, their balance, their impressiveness, their grand instinct of decoration; but while they had compassed these qualities at an entire sacrifice of life and animation, it is the glory of Giotto to have been the first among his countrymen to breathe life into art, and to have quickened its stately rigidity with the fire of natural incident and emotion. It was this conquest, this touch of the magician, this striking of the sympathetic notes of life and reality, that chiefly gave Giotto his immense reputation among his contemporaries, and made him the fit exponent of the vivid, penetrating, and practical genius of emancipated Florence. His is one of the few names in history which, having become great while its bearer lived, has sustained no loss of greatness through subsequent generations.

No two men were ever more unlike than the rustic Giotto and the patrician Dante; but among the high places of his

tory, their figures stand side by side on a common eminence. They were contemporaries, Dante being the elder of the two by eleven years, and friends, or, at the least, acquaintances. The poetry of Dante, reporting concerning things unseen with a definiteness not less than that of actual vision, served in many ways, until the days of Michelangelo, not only as an inspiration but as a law to the religious art of Italy. This inspiring and legislating authority of the sacred poet was exercised first of all upon Giotto,—partly, it appears, by means of personal intercourse between the two men. On the other hand, Giotto is celebrated in Dante's verse as the foremost painter of the new age. Nor is this the only tribute to his pre-eminence which we find in contemporary, or almost contemporary, literature. He is from the first a kind of popular hero. He is celebrated by the poet Petrarch and by the historian Villani. He is made the subject of tales and anecdotes by Boccaccio and by Franco Sacchetti. From these notices, as well as from Vasari, we gain a distinct picture of the man, as one whose nature was in keeping with his peasant origin; whose sturdy frame and plain features corresponded to a character rather distinguished for shrewd and genial strength than for sublimer or more ascetic qualities; a master craftsman, to whose strong combining and inventing powers nothing came amiss; conscious of his own deserts, never at a loss either in the things of his art or in the things of life, and equally ready and efficient whether he has to design the scheme of some great spiritual allegory in color or imperishable monument in stone, or whether he has to show his wit in the encounter of practical jest and repartee. From his own hand we have a contribution to literature which helps to substantiate this conception of his character. A large part of Giotto's fame as a painter was won in the service of the Franciscans, and in the pictorial celebration of the life and ordinances of their founder. As is well known, it was a part of the ordinances of Francis that his disciples should follow his own example in worshipping and being wedded to poverty,—poverty idealized and personified as a spiritual bride and mistress. Giotto, having on the commission of the order, given the noblest pictorial embodiment to this and other aspects of the Franciscan doctrine, presently wrote an ode in which his own views on poverty are expressed; and in this he shows that, if on the one hand his genius was at the service of the ideals of his time, and his imagination open to their significance, on the other hand his judgment was very shrewdly aware of their practical dangers and exaggerations.

Giotto di Bondone (a name, as it happens, also borne in the same generation by a distinguished citizen of Siena) was the son of a poor peasant of Vespignano. He was born in 1276, and drew, we are told, by natural instinct with whatever materials he could lay his hands on. He was ten years old when Cimabue, as the story goes, found him by the wayside, drawing a sheep with a piece of charcoal upon a stone or tile. The master, then at the height of his fame, took the peasant boy, with the glad consent of his father, to Florence to be his pupil. Of his early career after this we know no more until we find him at work as the foremost among many scholars employed under Cimabue at the interior decorations of the great memorial church of St. Francis at Assisi. This church consists of two structures, one superimposed on the other; it is of the upper and not of the lower church that we speak at present. On the walls of this, a great series of frescoes, now more than half obliterated, was painted by the primitive masters of the Tuscan school, including some of older and some of younger standing than Cimabue. The series is in three tiers, the uppermost tier containing scenes from the Old Testament; the next, scenes from the New; the lowest, scenes from the life of St. Francis. It is in this last tier that we can discern with certainty the hand of the youthful Giotto. The extent of his participation has been much debated. According to the more probable opinion, it can be traced even in the earlier scenes of the history; but it is in the later scenes only that the hand and promise of the master, the presence of a new and vital spirit, reveal themselves with fulness. Some interval (but the chronology of Giotto's career is at all points obscure) would seem to have elapsed between the execution of these frescoes and of others, better known than these, which adorn the lower story of the same structure. In four lunette-shaped spaces in the vaulting of this lower church, Giotto has painted four vast compositions, of which the scheme was dictated to him, no doubt, by some pious and learned mouthpiece of the wishes of the order. One of these exhibits the mystical wedding of Francis with Poverty; a second is an allegory of Chastity; a third, of Obedience; a fourth shows the saint glorified in heaven among the angels. To describe and explain these famous compositions would be beyond our scope. The ideas they embody cannot but seem strained and cold when we express them in modern language. Strained and cold, indeed, the ideas would have been in any other age of the world; but we must remember that the religious temperament of that age in Italy gave even to pedantry the colors of passion, and an ardent and solemn reality to the most far-drawn fantasies of devotion. And however cool the private judgment of Giotto in such matters may have been, it is not his private judgment which speaks to us from the painted allegories of Assisi; it is the sincere imagination of the men among whom he lived; it is the ardor and solemnity of the devotional spirit of his race. In one of the transepts of the same lower church there are frescoes of the Passion of Christ, and others of the life of St. Francis, which modern authorities hold against ancient, most likely with justice, to be also from the hand of Giotto.

Assuming that the later work of the master at Assisi belongs to the year 1296 or thereabouts, we have good evidence that two years afterwards he was working at Rome for the Cardinal Stefaneschi, nephew of Pope Boniface VIII. The remains of his industry in this employment may be seen in a mosaic of the *Navicella*, or Christ saving St. Peter from the waves, now preserved in the portico of St. Peter's at Rome, and in three panels, kept in the sacristy of the canons of the same church, which originally formed part of a ciborium. It is also recorded that Giotto adorned certain MSS. with miniatures for this patron; and in truth there exists in public libraries a very rare class of MSS., in which the miniatures bear the marks, if scarcely of the hand, at any rate of the immediate influence of Giotto. Lastly, a discolored fragment of a fresco of the church of St. John Lateran shows a figure of Pope Boniface VIII. announcing from a balcony the opening of the famous Jubilee of the year 1300. Soon after this, Giotto was once more in his native city. Recent research has again thrown in doubt the relative shares of the master and of his pupils in the decorations of the chapel, called by Ghiberti the chapel of the Magdalene, in the Bargello or palace of the Podestà at Florence. These were painted to celebrate the pacification between the Black and White parties in the state, effected by the Cardinal d'Acquasparta as delegate of the Pope in 1302, and consisted of a series of Scripture scenes, besides great compositions of Hell and Paradise. It is in the Paradise that the painter has introduced those groups, typical of pacified Florence, in which occur the portraits of Dante, Brunetto Latini, and Corso Donato, and which, amid the emotion of all who care for art or history, were recovered in 1841 from the whitewash that had overlain them.

The whole central period of Giotto's life, from about 1305 to about 1334, is divided between periods of residence at Florence and expeditions, of which we can in very rare instances trace the date or sequence, undertaken in consequence of commissions received from other cities of the peninsula. He was as much or more of a traveller as was Van Eyck a century later; and his travels exercised as much or more of the same fertilizing and stimulating influence on art in Italy as did those of the great Fleming in the north-west of Europe. The familiar story of the O belongs to a journey to France, which was projected by Giotto but never undertaken. Pope Benedict XI., the successor of Boniface VIII., sent a messenger to bring him proofs of the painter's powers. Giotto would give the messenger no other sample of his talent than an O drawn with a free sweep of the brush from the elbow; but the pope was satisfied, and engaged Giotto at a great salary to go and adorn with frescoes the papal residence at Avignon. Benedict, however, dying at this time (1305), nothing came of this commission; and the Italian 14th century frescoes, of which remains are still be seen at Avignon, have been proved to be the work, not, as was long supposed, of Giotto, but of the Sienese master, Simone Martini, called Simone Memmi. Another certain date in Giotto's career belongs to the close of the period we have defined. In 1328 he had painted in the palace of the Signoria at Florence a portrait (now lost) of Charles of Calabria kneeling before the Virgin. Two years

later he was invited by the father of this prince, King Robert of Naples, to come and work for him in that city. Some frescoes in the chapel of the Incoronata had been long erroneously supposed, on the authority of Petrarch, to represent a part at any rate of the industry of Giotto during the three years which he spent at Naples. It is the merit of Messrs. Crowe and Cavalcaselle, while conclusively setting aside this tradition, to have called attention to a real and very noble work of the master existing in a hall which formerly belonged to the convent of Sta. Chiara in that city. This is a fresco celebrating the charity of the Franciscan order under the figure of the miracle of the loaves and fishes, with the personages of St. Francis and St. Clare kneeling on either hand.

Between these two dates (1305 and 1330), Giotto is said to have resided and left great works at Padua, Ferrara, Urbino, Ravenna, Rimini, Faenza, Lucca, and other cities; and in several of these paintings are still shown which bear his name with more or less of plausibility But among them it is at Padua only that his authentic and mature powers can really be studied, and that in perhaps the greatest and most complete series of creations of all that he has left. These are the frescoes with which he decorated the chapel built in honor of the Virgin of the Annunciation by a rich citizen of the town, Enrico Scrovegni, and called sometimes the chapel of the Arena, because it is on the site of an ancient amphitheatre. Since it is recorded that Dante was Giotto's guest at Padua, and since we know that it was in 1306 that he came from Bologna to that city, we may conclude that to the same year, 1306, belongs the beginning of Giotto's great undertaking in the Arena chapel. The scheme includes a Saviour in Glory over the altar, a Last Judgment over the entrance door, and on either side a series of subjects from the Old and New Testaments and the apocryphal Life of Christ, painted in three tiers, and lowest of all, a fourth tier with emblematic Virtues and Vices in monochrome, the Virtues being on the side of the chapel which is next the incidents of redemption in the entrance fresco of the Last Judgment, the Vices on that side which is next the incidents of perdition. There is no other single building, or single series of representations, in which the highest powers of the Italian mind and hand at the beginning of the 14th century may be so well studied as here. In the same city, the great Franciscan church of St. Antonio contains also the remains of works by the master. And it was still for the same order, in their renowned church of Santa Croce, that Giotto executed most of the paintings which mark the periods of his residence in Florence. Besides a vast altar-piece or panel for the Baroncelli chapel, he decorated with frescoes the walls of a number of private chapels in this church. The Baroncelli altar-piece still exists; the only chapels of which the frescoes have been uncovered are those of the Bardi and Peruzzi. Nor are these the only walls in Florence which to this day bear record of the powers of Giotto—without taking into account many that are attributed to him, but are really by the hand of pupils like Taddeo Gaddi or Puccio Capanna, or of weaker followers like Giottino, Giovanni da Milano, or Agnolo Gaddi.

Meanwhile, Giotto had been advancing, not only in fame, but in years and in prosperity. He was married young, and had, so far as is recorded, three sons, Francesco, Niccola, and Donato, and three daughters, Bice, Caterina, and Lucia. He had added by successive purchases to the plot of land inherited from his father at Vespignano. His fellow-citizens of all occupations and degrees delighted to honor him. And now, in his fifty-eighth year, on his return from Naples by way of Gaëta, he received the final and official testimony to the esteem in which he was held at Florence. By a solemn decree of the Priori (April 12, 1334), he was appointed master of the works of the cathedral of Sta. Reparata (subsequently and better known as Sta. Maria del Fiore), and architect of the city walls and of the towns within her territory. Dying in 1336, he only enjoyed these dignities for two years. But in the course of these two years he had found time not only to make an excursion to Milan, on the invitation of Azzo Visconti and with the sanction of his own Government, but to plan and in part to superintend the execution of two monuments of architecture, of which the one remaining is among the most exquisite in design and richest in decoration that were ever conceived by man. These were, the west front of the cathedral, and its detached campanile or bell tower. The cathedral front was barbarously stripped of its enrichments in a latter age, and stood naked until the other day, when the city of Florence undertook to restore it in a modern imitation. The campanile remains, except for inconsiderable repairs, as it was left by the pupils of Giotto after their master's death; and in the consummate dignity as well as consummate delicacy of its design, in its fair proportions and in the opulent but lucid invention and apportionment of its details, in the thoughtfulness and pregnant simplicity of its sculptured histories, it is the most fitting crown and monument of a strong and memorable career.

A complete bibliography of the earlier as well as the most recent authorities on Giotto would here be out of place. The main materials and references will be found in the following:—Vasari, ed. Lemonnier, vol. i. pp. 309 *sqq.*; Crowe and Cavalcaselle, *Hist. of Painting in Italy*, vol. i. chaps. 8 to 11; Ernst Förster, *Geschichte der Italienischen Kunst*, vol. ii. pp. 211 *sqq.*, and E. Dobbert in article "Giotto" in Dohme's *Kunst und Künstler*, vol. iii. (s. c.)

GIOVINAZZO, a town of Italy, in the province of Bari, about 11 miles from Bari, on the railway from Otranto to Bologna. Situated on the coast, it has a small harbor, and carries on an export trade in the olives, almonds, and carobs produced in the vicinity. It is also the seat of a bishop, and possesses a cathedral, a castle, and a famous *ospizio* or poorhouse, which was founded by Ferdinand I. of Naples, and is now used partly for the education of foundlings and orphans, and partly for the reformatory treatment of juvenile criminals. Cloth, carpets, thread, and shoes are among the manufactures of the place, and the children of the ospizio are largely trained in such industries. Whether the identification with the ancient town called Netium or Natiolum be well founded or not, it is certain that Giovinazzo was in existence at a very early date, and some portions of its seawall are supposed to belong to the later Roman period. The population of the town in 1901 was 11,138, and of the commune 11,245.

GIOVIO, Paul. See Jovius.

GIPSIES, a wandering folk scattered through every European land, over the greater part of Asia and North America, and along the northern coast of Africa. Bell of Antermony speaks in his *Travels* (1763) of meeting at Tobolsk a band of sixty Tziggany on their way to China; Koster describes the Brazilian Ciganos (*Travels in Brazil*, 1816); and at the present day cases of Gipsy emigration to Australia are not unknown. No general estimate can be formed of their numbers outside Europe, but travellers agree that they are very numerous in Persia (3000 families in 1856), Armenia, Asiatic Turkey (67,000 in 1877), and Egypt (one alone of the three chief tribes, the Ghagars, being reckoned at 16,000); whilst in America, besides a multitude of British Gipsies, Gipsies from Spain, France, Germany, and Hungary are not unfrequent. The total, 700,000, at which Miklosich placed (1878) the European Gipsies, fairly agrees with the following fragmentary statistics. Turkey, before its late dismemberment, contained 104,750 (9537 in Bosnia and the Herzegovina in 1874); Servia had 24,691 in 1874, Montenegro 500 in 1873; and in Roumania there are from 200,000 to 300,000, according to the varying estimates of Cretzulesco (1876) and the *Annuaire général officiel de Roumanie* (1874). In 1876 Austria counted about 1000 (13,500 in Bohemia in 1846?), and Hungary 159,000 (78,923 in Transylvania in 1850, and 36,842 in Hungary proper in 1864); while Spain is credited with 40,000, France with from 2000 to 6000 (700 in the Basque country), Germany and Italy together with 34,000 (?) and Scandinavia with 1500. In Russia their number in 1834 was stated at 48,247, exclusive of Polish Gipsies, in 1844 at 1,427,539, and in 1877 at 11,654.[1]

*Names.*—Just as in every European land the Gipsy calls "Gentiles" (*i. e.*, non-Gipsies) *gajé*, he calls himself *Rom*, "a man or husband." This word *Rom*, connected by Paspati with the name of the Indian god *Ráma*, is by Miklosich identified with the Sanskrit *ḍoma* or *ḍomba*, "a low-caste musician."[2] Of names conferred by "Gen-

[1] In England the census of 1871 gives the number of "vagrants and Gipsies" as 2280, in Scotland of "vagrants" as 1793. These figures, however, while they include a good many non-Gipsy tramps and show-people, exclude all house-dwelling Gipsies, besides the Gipsy horse-dealers, basket-makers, hawkers, and tinkers, entered under their several headings, and are therefore utterly valueless.

[2] *Sinté*, another appellation current among the Gipsies of Germany, Poland, and Scandinavia, and possibly connected with the *Zinculo* of the Gitanos, has been likewise variously derived from the Sanskrit *Sindhu* (Indus) and from the Romani *sundô*, "famous," whilst Batail-

tiles," some point to the fancied cradle of the Gipsy race. Thus *Gipsy* or *Gypsy* itself (*Egyptian* in the 16th century), the Spanish *Gitano*, Albanian *Jevk*, modern Greek Γύφτος, Magyar *Pharao népek* ("Pharaoh's people"), and Turkish *Färäwni*, preserve the belief in its Egyptian origin, a belief which finds no confirmation except in the casual resemblance between *Rom* and the Egyptian *rôme*, "man" (*cf.* Rawlinson's *Herodotus*, vol. ii., p. 225), and which was possibly due to the Gipsies' skill in serpent-charming. The Scandinavian and Low-German *Tatare* identifies Gipsies with the Mongolian hordes, the terror of Europe in the 13th century; and their French name *Bohémiens* was probably due either to a confusion of some such form as *Secani* with *Czech* or to the belief that Gipsies originated in Bohemia. To the same class belong *Walachi, Cilices, Uxii, Saraceni, Agareni, Nubiani*, etc., cited by Fritschius (1660). Other names again denote the character, hue, or callings of the race, as Arabic *Harámí*, "villain;" Dutch *Heydens*, "heathens," Persian *Karáchí*, "swarthy;" and modern Greek Κατζίβελος, by Somavera derived from the Latin *captivus*, by Bataillard connected with βέλος, "a dart," and so with the Gipsies' name in Cyprus, *Kilindjiridès*, from the Turkish *gylidj*, "a sword." Their Scotch name *Tinkler*, which occurs in a charter of William the Lion (1165–1214), is commonly held to be a mere variant of *tinker;* but if its initial *t* correspond to *z* (*cf.* English *ten*, German *zehn*), it comes very near the Italian *Zingaro* or *Zingano*, which, like the German *Zigeuner*, Czech *Cingán* or *Cigán*, and Magyar *Cigány*, is a form of the most widespread of all the Gipsies' appellations—Bulgarian *Atzigan*, modern Greek Ἀτσίγκανος or Ἀθίγγανος. The last was also the title of a separatist sect in Asia Minor, so called, it is supposed, because its members kept themselves from contact with unbelievers (α privative, and θιγγάνω, "to touch"). Miklosich, finding in it the source of all the preceding forms, believes it to have been transferred by the Greeks to Gipsies, either because the latter entered the western parts of the Byzantine empire from Phrygia and Lycaonia, or because they were suspected of being adherents of the sect or simply as a nickname (Mikl., vi. pp. 57–66). Bataillard, on the other hand, identifying the heretic Ἀθίγγανοι with Gipsy Ἀτσίγκανοι, and these with the Σίγυνναι of Herodotus (v. 9), derives the name from σιγύνη, "a javelin;" while others among the countless etymologies proposed are Goeje's from Persian *chang*, "a kind of harp or cither;" Burton's from Persian *zang*, "Ethiopia;" and Newbold's from Persian *zîn*, "a saddle."

*First Appearance in European History.*—From whatever cause, it is certain that a confusion did exist between the Ἀτσίγκανοι and Ἀθίγγανοι, which renders it extremely difficult to determine whether the Byzantine historians are speaking of Gipsies or heretics in seven passages collected by Miklosich. It appears from these that Ἀθίγγανοι, described as magicians, soothsayers, and serpent-charmers, first emerge in Byzantine history under Nicephorus I. (802–11), were banished by Michael I. (811–13), and were restored to favor by Michael II. (820–29); but Miklosich's reasons for absolutely identifying them with Gipsies, and positively asserting the latter to have appeared at Byzantium in 810 under Nicephorus, are hard to recognize. Less dubious seems an extract from the Georgian *Life of Giorgi Mtharsmindel* (11th century), which describes how at Constantinople certain descendants of the race of Simon Magus, *Atsinkan* by name, sorcerers and famous rogues, slew wild beasts by their magic arts in the presence of Bagrat IV. Such passages are open to some doubt; hardly so the following from the *Itinerarium Symonis Simeonis* (ed. by J. Nasmith, Camb. 1778), where Fitz Simeon, a Franciscan friar of Dublin, describing his stay in Crete in 1322, says:—"We there saw a people living outside the city (of Candia), who worship according to the Greek rite, and declare themselves of the race of Ham. They rarely or never stop in one place more than thirty days, but, as though accursed of heaven, wander from field to field with little, oblong, black, low tents, like those of the Arabs, or from cave to cave." The empress Catherine de Valois, again, who died in 1346, granted to the suzerains of Corfu authority to reduce to vassalage certain *homines vageniti* coming from the mainland, who under the Venetians formed in 1386 the nucleus of a *feudum Acinganorum* that lasted down to the present century. About 1378 the Venetian governor of Nauplion confirmed the *Acingani* of that Greek colony in privileges granted by his predecessors; and in 1387 Mircea I., waiwode of Wallachia, renewed a grant made by his uncle Ladislaus to the monastery of St. Anthony at Voditza of forty *salaschi* (tents) of *Acigani*. Other documents might be cited, but these are enough to show that in the 14th century Gipsies existed in the Balkan peninsula and islands of the Levant; that in Wallachia they were reduced to a state of bondage (from which they were only freed in 1856); and that nowhere were they regarded as new-comers, so that by these documents it is impossible to fix the date of the first Gipsy immigration. More than this, a metrical German paraphrase of Genesis, made by an Austrian monk about 1122, preserved at Vienna, and edited by Hoffmann in his *Fundgruben für Geschichte deutscher Sprache* (Breslau, 1837), goes far to prove that Gipsies were known in Austria three centuries before the commonly-accepted date of their appearance in that country. A passage relating to Hagar's descendants (Gen. xvi. 15) runs:—"So she (Hagar) had this son; they named him Ishmael. It is from him the Ishmaelites descend. They journey far through the world; we call them *chaltsmide* (lit. cold-smiths). . . . They have no house nor country; everywhere they are found alike; they wander over the country, abusing people by their knaveries. Thus they deceive men,—robbing no one openly." That here by *chaltsmide, Ishmaelites*, and *descendants of Hagar* Gipsies are meant, scarcely admits of doubt, seeing that the smith's is still the Gipsies' leading handicraft; that Lusignan in 1573 speaks of the Gipsies of Cyprus as "Cinquanes, otherwise called *Agariens;*" and that in German and Danish *Rotwälsch* or thieves' slang *Geschmeilim* and *Smaelem* (*i.e.*, Ishmaelites) signify "Gipsies." The κωμοδρόμοι also of Byzantine writers were possibly Gipsies, being defined by Ducange as "circulatores atque adeo *Fabri ærarii* qui per pagos cursitant: ut hodie passim apud nos, quos *Chaudronniers* dicimus." Theophanes (758–818) speaks under the date 544 of a κωμοδρόμος from Italy.

*Later Movements.*—Late in 1417 there came to Lüneburg a band of 300 wanderers, "black as Tartars and calling themselves *Secani*." At their head rode a "duke" and "count," splendidly dressed, and leading like nobles dogs of chase; next came a motley crew afoot; and women and children brought up the rear in wagons. They bore among other letters of safe-conduct one granted by the emperor Sigismund, and professed themselves engaged on a seven years' pilgrimage, imposed by their bishops in expiation of apostacy from the Christian faith. From Lüneburg they passed to Hamburg, Lübeck, Wismar, Rostock, Stralsund, and Greifswald, camping by night outside the walls, thieving by day, "wherefore several were taken and slain" (*cf.* the contemporary annals of Korner and Rufus, and Krantz's *Saxonia*, 1520). In 1418 they journeyed southwards through Meissen, Leipsic, and Hesse, and, entering Switzerland, arrived at Zurich on August 31st, visiting also Basel, Bern, and Solothurn, according to Conrad Justinger (died 1426) who speaks of them as "more than 200 baptized heathens from Egypt." They now split up into two bands, the first of which appeared before Augsburg (November 1, 1418), the second before Sisteron in Provence (October 1, 1419), where the terrified citizens bestowed on the "Saracens" a hundred loaves. Next comes a long notice of a troop of fully 100 lean, black, hideous Egyptians in the *Chronica di Bologna* (July 18, 1422), which tells how the sorceress, "Duke" Andrew's wife, could read the past and future of men's lives; but Bologna in fifteen days became too hot for them, so by way of Forli—where "certain said they were from India"—the pilgrims travelled on to Rome. Their object was to procure fresh letters from the Pope; and such they afterwards produced, though of their sojourn in the imperial city no record has yet been published. To the burghers of Ratisbon Gipsies presented themselves in 1424; they pitched their tents again before its walls in 1426; and at Paris in 1427 the fair of Landit was attended by a duke, a count, and ten other mounted pilgrims, late renegades of "Lower Egypt," whose women practised palmistry and cleared everybody's pockets. Later we hear of Gipsies at Arnheim (1429), at Metz (1430), at Erfurt (1432), and in Bavaria (1433)—these and all notices of the seventeen years preceding referring probably to the movements of a single ubiquitous band, sent forward to spy out the lands of promise, and composed of from 600 to 1400 persons. For not until 1438 did the great tide of westward immigration

ıard identifies it with the Σίντιες or Σίντιοι ἄνδρες of Homer, Strabo, etc. (*cf.* Pott, i. 32–35).

begin to flow; then, not in hundreds but thousands, headed no longer by paltry "dukes" and "counts," but by a "king," King Zindl,[1] the Gipsies poured over Germany, Italy, and France, reaching Poland by 1501, Sweden by 1512, and having already appeared in Spain in 1447. We find them in England in 1514 (*A Dyaloge of Syr Thomas More*, 1529), but nothing is known of the date of their landing; and in Scotland the earliest certain record of their presence is an entry in the books of the Lord High-Treasurer: "Apr. 22, 1505. Item, to the Egyptianis, be the kingis command, vij. lib." (Pitcairn's *Criminal Trials*, Edin. 1833, vol. iii. p. 592). In a "King of Rowmais" (? *Rómas*, Gipsies), twice mentioned in entries of July, 1492, as also in the "Erle of Grece" (1502), "King Cristall" (1530), and the "King of Cipre" (1532), one dimly recognizes four Gipsy chiefs; and with Gipsies perhaps the Saracens may be identified, whom a tradition represents as making depredations in Scotland prior to 1460 (Simson, p. 98). In no other country were Gipsies better received than in this, where they "dansit before the king in Halyrudhous" (1530); where James IV. gave (July 5, 1505) Anthonius Gagino, count of Little Egypt, a letter of commendation to the king of Denmark; and where James V. subscribed a writ (February 15, 1540) in favor of "oure louit Johnne Faw, lord and erle of Litill Egipt,"[2] to whose son and successor he granted authority to hang and punish all "Egyptians" within the realm (May 26, 1540). But in 1541 an Act was passed, commanding the "Egyptians to pass forth of the realm" under pain of death, and similar edicts were issued before and afterwards in most of the European states—Germany (1497), Spain (1499), France (1504), England (1531), Denmark (1536), Moravia (1538), Poland (1557), etc. Conveying across the seas was among the milder measures adopted; it is, however, noteworthy as one of the causes of the dispersion of the tribes. Under Henry VIII. Gipsies were shipped from England to Norway (Wright's *History of Ludlow*, pp. 389–92) or France; whilst by the latter power, so lately as 1802, the bands infesting Bayonne and Mauléon were caught by night as in a net, huddled on shipboard, and landed on the coast of Africa (Michel, *Pays Basque*, p. 137). In Scotland four Faas were hanged at Edinburgh in 1611 "for abyding within the kingdome, they being Egiptianis," and in 1636 doom was pronounced on other "Egyptians" at Haddington, the "men to be hangit, and the weomen to be drowned; and suche of the weomen as hes children to be scourgit throw the burgh and brunt in the cheeke." Under the English statute of 1562 (repealed 1783) making it felony without benefit of clergy to be merely seen for a month in the fellowship of Gipsies, five men were hanged at Durham "for being Egyptians," 8th August, 1592. Still greater were the cruelties and injustice suffered by Gipsies on the Continent, since there, to the charge of kidnapping, were added the weightier imputations of being cannibals and emissaries of the Turk. Quiñones recounts how in 1629 four Estremaduran Gitanos owned under torture to having eaten a friar, a pilgrim, and a woman of their tribe; and in 1782 forty-five Hungarian Gipsies were beheaded, quartered, or hanged on a like monstrous charge. First racked till they confessed the crime of murder, they were brought to the spot where their victims were said to be buried, and when no bodies appeared they were racked again. "We ate them," was their despairing cry; and forthwith the journals teemed with accounts of "eighty-five persons roasted by Gipsy cannibals;" straightway the "cannibals" were hurried to the scaffold. Then Joseph II. sent a commission down, whose inquiries showed that no one had been murdered—except the victims of the false accusation. The full, impartial annals of the race have still to be compiled from edicts and law-books, from local histories and a few monographs like Dirk's *Geschiedkundige onderzoekingen aangaande het verblijf der Heidens of Egyptiërs in de Noordelijke Nederlanden* (Utrecht, 1850) or Weber's *Zigeuner in Sachsen*, 1488–1792, in vol. ii. of his *Aus vier Jahrhunderten* (Leip. 1861).

*Language.*—Until lately the information about the Gipsy language to be gathered from books was meagre in the extreme. The thirteen works published prior to 1840 which furnish specimens of the Anglo-Romani dialect—Boorde (1547), Bryant (1785), Bright (1818), Copsey (1818), Harriot (1830), Roberts (1836), etc.—together contain but 396 genuine stems, besides 69 doubtful words, and furnish scarcely any examples of the grammar. Nor are the Continental works cited by Pott, from Vulcanius (1589) downwards, much more copious. Even to-day there are still great gaps in our knowledge, especially of the dialects outside of Europe; but enough has been done to show that from the Nile to the Arctic Ocean, from the Euphrates to the Atlantic, the Gipsies speak, with dialectal variations, one and the selfsame speech. The Romani names for "water," "fire," "hair," and "eye" are in Persia *páni, aik, bál,* and *aki;* in Egypt *páni, ág, bal,* and *ankhi;* in Norway *pani, jag, bal,* and *jak;* in England *páni, yog, bal,* and *yok.* And these four instances, which might be multipled indefinitely, serve further to show, by their resemblance to the Hindi *pānī, āg, bāl,* and *āṅkh,* that in Romani we have an Indian tongue. Rüdiger first compared Romani, so long regarded as a thieves' jargon, with one of the New Indian dialects, and in 1782 published the result of the comparison in his *Neuester Zuwachs der Sprachkunde.* In 1783 Grellmann's *Historischer Versuch* reaped all the fruits of Rüdiger's research; and in the same year Marsden was independently led to a like discovery. The conclusion that the Gipsies wandered forth from India is now almost universally accepted, but when, or from what part of India, are questions on which few have done more than idly speculate. Whether Romani is derived from Hindi, Marathi, etc., can only be determined by minute investigations, which, long neglected, are now being carried on by various Orientalists. They have at least established that Romani stands in the relation of a sister, not a daughter, to the seven principal New Indian dialects. Its forms are often more primitive than theirs, sometimes than those of Pali or the Prakrits, *e. g.*, *vast,* "hand" (Sanskrit *hasta,* Pali *hattha*), *kasht,* "wood" (Sanskrit *kāshtha,* Pali *kattha*), *vusht,* "lip" (Sanskrit *oshṭha,* Pali *ottha*), *trash,* "fear" (Sanskrit *trāsa,* Pali *tas*), *trin,* "three" (Sanskrit *tri, trīṇi;* Pali *ti, tini*) and *pral,* "brother" (Sanskrit *bhrātā,* Pali *bhāta*). And while the archaisms of Romani forbid us to derive it from Hindi or Marathi, some of its seemingly modern forms are the result of independent development. On the other hand, our knowledge of Romani itself, and of the multitudinous spoken dialects of India, is not at present sufficient to warrant our pronouncing the former more primitive than any of them; and as a fact many of its archaisms may be paralleled in the languages of Dardistan and Kafiristan (*cf.* Miklosich, *Beiträge,* iv. 45–54). Thus there are difficulties on both sides in the way of adjudicating between the opinions of Ascoli and Miklosich. The former maintains (*Saggi Indiani,* vol. ii., 1875) that Romani, preserving certain consonantal *nexus* which had almost entirely disappeared at the epoch of the most ancient Prakrit texts, approaches Sanskrit more nearly even than Pali—conclusions, he observes, that harmonize well with Bataillard's pre-historic theory. Miklosich, on the other hand, opposes that theory in Meyer's *Konversations-Lexikon* (3d ed. 1878), where he infers from the agreement of Romani in its phonetic laws and system of case-endings with the modern Aryan languages of India that the emigration cannot have taken place till these were formed, *i. e.*, until after the Prakrit period.

In Europe Miklosich distinguishes thirteen Romani dialects—the Greek or Turkish, Roumanian, Hungarian, Moravo-Bohemian, German, Polo-Lithuanian, Russian, Finnish, Scandinavian, Anglo-Scottish, Italian, Basque, and Spanish. To these should be added the Welsh, which, generally unintelligible to the English Gipsy, is one of the most perfect, as it has also been the least studied, of all the dialects. As a general rule, the further these dialects remove from Turkey, the more corrupt have they become, so that the Gipsies of Spain, of Scandinavia, and in great measure of England, know no case or verb endings other than those of the lands of their adoption. From Turkish Romani, therefore, and Welsh the following examples will be drawn. The Turkish (marked T.) are taken from Paspati;

[1] The titles of king, duke, earl, count, and (in south-eastern Europe) waiwode were and are borne by the chiefs of greater or smaller bands, more to impress the vulgar than as denoting real authority. With British Gipsies one is bewildered by the host of *soi-disant* kings and queens, from King John Bucke, laid side by side with Athelstan in Malmesbury Abbey in 1657, down to the Gipsy queen of the United States, Matilda Stanley, royally buried at Dayton, Ohio, in 1878.

[2] This letter has an especial interest, since it presents the earliest specimens of the Gipsy tongue, in the names of three of the Gipsies mentioned in it: Grasta (*grast,* "a horse"), Towla Bailyow (*túlo baúlo,* "fat pig"), and Matskalla (? *matchka,* "cat"). Paspati gives as female Turkish Gipsy names *Tchiriclí,* "bird," and *Sappní,* "viper;" but probably the above were merely assumed by way of a jest, like *Corrie* (Hoyland, p. 165), and *Gallimensch* (Pott, i. 52). See, on Gipsy names, Mr. Crofton in *Notes and Queries* (5th ser., vol. ii. p. 349).

the Welsh (W.) are derived from letters and stories written by John Roberts, the oldest living harper, whose thorough knowledge of his language is probably unique.

The definite article, wanting in Asia, is suppliod in every European dialect by the Greek ὁ and ἡ—ὁ for the masculine, ἡ for tho feminine and the oblique cases, *e. g.*, W. *Potchdas ow bearengaro e vaver tringengey*, "the sailor asked the other threo," *E collcy pendas*, "the Gipsy woman said." The indefinite article, in some dialects supplied by *yek*, "one," is still omitted by the Welsh and the "deeper" English Gipsies, *e. g.*, *Yeker porro gougeo ta porrey gougey jivenes undra borrow veshestay*, "onee (an) old man and (an) old woman were living in (a) groat wood." Romani has no trace of either a dual number or a neuter gender. Excepting monósyllables, most of its nouns terminate in *-o* (masc.) and *-i* (fem.), as *raklo*, "lad," *rakli*, "girl." Masculino nouns ending in a consonant form their feminines in *-ni*, as *rom*, "husband," *romni*, "wife." Inanimate objects are indifferently masculino or feminine: to the former belonging *gav*, "town," and *gad*, "shirt;" to the latter *nok*, "nose," and *bok*, "hunger." *Rom*, "a husband," and *rakli*, "a girl," are thus declined in Turkish Romani:—

| | Sing. | Plur. | | Sing. | Plur. |
|---|---|---|---|---|---|
| Nom. | Rom | Rom-á | Nom. | Rakli | Rakli-á |
| Acc | Rom-és | Rom-én | Acc. | Rakli-á | Rakli-én |
| Geu. | Rom-éskoro | Rom-éngoro | Geu. | Rakli-ákoro | Rakli-éngoro |
| Dat. i. | Rom-éste | Rom-énde | Dat. i. | Rakli-áte | Rakli-énde |
| Dat. ii. | Rom-eske | Rom-énghe | Dat. ii. | Rakli-áke | Rakli-énghe |
| Instr. | Rom-ésa | Rom-éndja | Instr. | Rakli-ásа | Rakli-éndja |
| Abl. | Rom-éstar | Rom-éndar | Abl. | Rakli-átar | Rakli-éndar |
| Voc. | Róm-a | Rom-ále | Voc. | Rakli-e | Rakl-ále |

Here the so-called genitivo is in reality an adjective. It precedes and agrees in gender with its noun, *e. g.*, T. *e dervishéskeri rakli*, "the dervish's daughter;" W. *sonckaiesko mochto*, "a golden box," and *dakey pen*, "mother's sister." Welsh Gipsies often use tho dative where we should look for the genitive, as in *Te pogerel yeck e herrenday ow vodrestay*, "to break one of the legs of the bed." Datives and instrumentals are formed by suffixing to accusatives tho separable post-positions *te* or *ke*, "to," and *sar*, "with;" and the *-tar* of the ablative (also occurring in *ká-tar*, "whence" lit. "where from") Pott (i. 188) compares with the Pali adverbial ending *-to* = Sansk. *tas* = Lat. *-tus* in *cælitus*. In most European Romani dialects considerable confusion has arisen in the use of the oblique cases, but Welsh Gipsies employ the following rightly enough: Sing. acc. *te dickel ow krallises*, "to seo the king;" dat. masc. *te dickel pesko jivamaskay*, "to look for his living;" dat. fem. *pendas e gougeackey*, "she said to tho woman;" inst. *rokkerdas ow krallisesa*, "ho spoke with the king;" voc. *Ria*, "Sir!"—Plur. acc. *te patsell e callen*, "to believe the Gipsies;" dat. *te kerrav les undra chichaw grengey*, "to make it into shoes for horses;" voc. *Chovollay*, "mates!" Nouns ending in *-o* form their plural in Welsh, as in Turkish Romani, in accented *-é*, *e. g.*, *chavay*, "children" (sing. *chávo*), and *chiriklay*, "birds" (sing. *chiriklo*); other nouns form it in *-a* or *-ïa*, as *chaia*, "girls" (sing. *chai*), *tema*, "lands" (sing. *tem*), *penya*, "sisters" (sing. *pen*), etc. Of adjectives it need only be remarked that, with rare exceptions, they end in *-o* (masc.) and *-i* (fem.), and form the plural in *-é*, *e. g.*, W. *Java te kerra esa te rigeren tomen tatay*, "I go to make clothes to keep you (plur.) warm." The termination of the comparative is *-der*, *e. g.*, W. *porro*, "old," *poradare*, "older;" and the want of a true superlative is frequently supplied, as in Freneh, by prefixing the definite articlo to the comparative, *e. g.*, W. *con see ow poradare*, "who is the eldest." Romani pronouns present an interesting study, since everywhere they have been better presorved than any other parts of speeeh. Turkish Romani gives *me*, "I," *man*, "me," *amén*, "we," eto., and *tu*, "thou," *tut*, "thee," *tumén*, "ye" (lit. thou-we), otc., all of which forms are employed by English and Welsh Gipsies. How strikingly indeed the Turkish and Welsh dialects agree may bo seen from the instauces following these paradigms, taken from Paspati, of *ov*, "he," *ói*, "she," and *ol* (Bohemian Romani, *jon*) "they:"—

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Nom. | ov | ói | ol | Dat. ii. | léske | láke | lénghe |
| Acc. | les | la | len | Instr. | lésa | lása | léndja |
| Gen. | léskoro | lákoro | léngoro | Abl. | léstar | látar | léndar |
| Dat. i. | léste | láte | lénde | | | | |

Now in Welsh Romani we find: Sing. Masc. nom. *Pendas yov*, "said he;" gen. *lesko pickoo*, "his shoulder;" acc. *cordas les poley*, "ho called him back;" dat. i. *deyas lestay*, "ho gave him;" dat. ii. *chotchy ow Rye leskay*, "quoth the gentleman to him;" inst. *bitcherdas vaver yeck lessa*, "he sent another one with him:" Sing. Fem. nom. *yoi comdas les*, "she loved him;" gen. *unrea lacko nogo drom*, "in her own way;" acc. *yov comdas la*, "he loved her;" dat. i. *auey joncles yov chomaney trostel latay*, "whether he knew something about her;" dat. ii. *jalla te dickel lakey*, "he goes to look for her;" inst. *commesa to te jas lasa*, "wilt thou go with her:" Plur. nom. *yon jivenes*, "they were living;" gen. *saw c chava bitcherana lengo camyben*, "all the children send their love;" acc. *commos tokey te bichaves len*, "I should like you to send them;" dat. i. *trosel lenday*, "about them;" dat. ii. *potchdas lengey*, "he asked them;" instr. *potchday leskey so wantines lensa*, "they asked him what he wauted with them;" abl. *te tardel lovo from lenda*, "to extract money from them," where the English "from" is redundant. That nineteen out of the twenty-one forms of the Turkish dialect should be preserved in the Welsh after a separation of four centuries, Romani, moreover, being an unwritton language, is singular; hardly less striking is the similarity in tho uso of the reflexive pronoun *pes*, "himself" or "herself," *e. g.*, W. *dickel pesko drom ylan pestay*, "he sees his way before him;" *ow Jack rivdas pes*, "Jaek dressed himself;" *te den pengo lovo*, "to givo their moncy;" *e trin morsh gillay pengay*, "the three men went away" (lit. "went to themselves," a curious use). The third pronoun, *lo*, "he," *li*, "she," and *lé*, "thoy," eommonly only used after the auxiliary verb "to be," is also noteworthy, as playing an important part in the formation of the verb. Instances of its use are—W. *postey seslo kinno*, "till he was tired;" *vasavee chibalengerey ses le*, "she was a foul-tongued woman;" *trashaday seslay*, "they were frightened." The auxiliary verb runs in Turkish Romani: Pres. sing. *isóm*, *isán*, *ist* (*asti* in Asiatic R.); plur. *isám*, *isán*, *ist*: Imperf. sing. *isómas*, *isánas*, *isás*; plur. *isámas*, *isánas*, *isás*. And in Welsh Romani occur the forms, *shom*, "I am;" *shan*, "thou art;" *se*, "he is" or "they are;" *sham*, "we are" (*e. g.*, *sham betcherda te las a kai filashin*, "we are sent to get this mansion"); *shen*, "ye are;" *shomas*, "I was;" *shennes*, "thou wert" or "ye were;" *ses*, "he was" or "they were." The terminations of the present indicative in Turkish Romani are: Sing. *-va*, *-sa*, *-la*; Plur. *-sa*, *-na*, *-na*, which are joined immediately to the verbal stem (identical with the imperative) if it is monosyllabic and ends in a vowel, but otherwise are connected with it by a vowel. For example, *lá-va*, "I take;" *lá-sa* (*lésa*), *lá-la* (*léla*), *lá-sa*, *lé-na*, *lé-na*; and *ker-á-va*, "I make;" *ker-é-sa*, eto. Welsh Romani retains all these forms, *e. g.*, *bitcherava*, "I send;" *shonesa*, "thou hearest;" *penela*, "he says;" *bitcherasa*, "we send;" *vena*, "ye come;" *bitcherena*, "they send." In *-va* (*-mi* in Asiatic R.), *-sa*, and *-la* (*cf. lo* above) may be recognized the first, second, and third personal pronouns; the *n* of the second and third persons plural may be compared with the *n* in *romén*, "husbands." The imperfect is formed from the present by the suffix of *-s*, or, in the Hungarian dialect, *-hi*, *e. g.*, T. *keráva-s*, "I was making;" Hung. *kamesa-hi*, "thou wast loving;" W. *salles*, "he was laughing," *jivenes*, "thoy were living." This *-s* or *-hi* is the third person singular of the auxiliary verb, *ist*, "it is," so that litorally *kerávas* means "I make + it is" (? some time ago). Perfects are compounded of participles—ending in *-do* (rarely *-to*), *-lo*, and *-no*—and the auxiliary verb. Thus from T. *piráva*, "I walk," part. *pirdó*, eomes *pird-óm*, "I walkod," *pird-án*, "thou walkedst," *pird-ás*, "he walked," ete.; and from *dáva*, "I give," part. *dinó*, *dinóm*, "I gave." Here too the Welsh agrees generally with the Turkish dialeet, *e. g.*, *kerdom*, "I made," *keddan*, "thou madest," *kerdas*, "he made;" but *kedan*, "we made," should properly be *kerdám*; and for the third person plural Welsh R., liko the German and other dialects, simply employs the plural participle, as *dicktta*, "they saw." In Continental dialects a pluperfect is formed from the perfect by adding to it *-a-s* or *-a-hi*, just as the imperfect from the present; and for a future *kama-* (*kamava*, "I love, wish, or will") is prefixed to the present, *e. g.*, *kama-keráva*, "I will do," *kama-kerésa*, "thou wilt do," otc. The sign of the subjunctive, which supplies the placo of an infinitive, is the conjunction *te*, "that," prefixed to tho indicative, which usually drops its vowel-ending, *e. g.*, T. *teréla dúi lav te pénel úke*, "he has two words to tell (lit. that he tells) you;" W. *trashaday seslay te dicken man*, "they were frightened to see (lit. that they see) me." Enough has been said to show that Romani is not so utterly "degraded in its grammar" as Max Müller has declared it to be; and tho following short Welsh Gipsy story (printed literatim from Roberts) will illustrate some of the foregoing remarks:—

Yeker a doi ses bearengaro ta vaver store morsh; yek ses
Onee there were (a) sailor and other four men; one was

peltanengero, ta ow vaver ses koramangaro, ta sivamangaro,
(a) blacksmith, and the other was (a) soldier, and (a) tailor

to pallano ses kirehimackaro. Ow bearengaro potehedas e
and the last was (au) innkeeper. The sailor asked the

into shoes for horses." Asked the sailor the other

trinengey te ven adra ow bearo. Ow koramangaro pendas ta
three to come in the ship. The soldier said that

jalla te kel moyaben ta javaben; to sivamangaro pendas,
he goes to make facings and marching; and the tailor said

"Shom to ja te kerra esa te rigeren tomen tatay." A ow
"(I) am to go to make clothes to keep you warm." And the
kirchimackaro pendas, "Java ma te kerra lovina te kel tomen
innkeeper said, "Go I to make beer to make you
matay, te jan saw to menday kai ow Beng." Okke saw
drunk, that may go all you to the Devil." Here (is) all,
dolestay.
to that (*i. e.*, of that).

The Romani vocabulary reveals positively and negatively the route by which the Gipsies must have entered Europe, and the various ways by which they have since dispersed to their present quarters. The absence, for instance, of Arabic elements from every European dialect disproves a common belief that the earliest immigrants may have landed in the Balkan peninsula from Egypt. On the other hand, the presence of Persian and Armenian words shows that they must have traversed and halted in the lands where those languages are spoken. Among the Persian are *devruál*, "sea," *poshóm*, "wool," *vesh*, "forest," *ambról*, "pear," and *avgin*, "honey;" whilst the Armenian words number twenty-six, according to Miklosich—*grast*, "horse," *chor*, "deep," *kotór*, "a piece," *mortí*, "skin," etc. Again, every dialect presents a large number of Greek words, testifying to the long residence of the Gipsies in a Greek-speaking land. In the German Romani dialect Miklosich reckons forty-two, besides the article, in the English thirty, which latter number might be certainly augmented. Alike in Russia and Spain, England and Hungary, Gipsies call a road *drom* (δρόμος), time *chairos* (καιρός), a horseshoe *petul* (πέταλον), a hat *stadi* (σκιάδι), etc.; in every land of Europe *éftá*, "seven," ὀχτώ, "eight," and *énnéa*, "nine," have superseded the *haut*, *asch*, and *nau* of Asiatic Gipsies. This identity of their borrowed words disproves the view that the Gipsies of different European countries are the result of successive immigrations. Next to the Greek, and almost more numerous than they, come the Slavonic elements. Miklosich cites 70 from the German dialect, 30 from the English, and from the Spanish 46, among them being *kralis*, "king," *kítchima*, "inn," *mátchka*, "cat," *lovina*, "ale," and *plashta*, "cloak." Similarly English Romani contains Wallachian, Magyar, German, and French words, showing that the Gipsies reached England after wandering among Greeks, Slavs, Magyars, Germans, and French. It must not, however, be inferred from the foregoing that Romani is essentially other than an Indian speech. The Gipsies' linguistic pilferings form but a small percentage in the 2332 articles gathered together by Pott. And though some of these articles, founded on error, must be struck out, their place might be more than filled up by omissions; and the sum total is largely multiplied when one considers how many derivatives are grouped under a single head. Altogether, the entire stock of Romani words probably exceeds 5000, though the number known to any individual Gipsy is often small.

*Elements of Literature.*—The Gipsies have no literature worthy of the name—nothing but some rude ballads, some love and dance songs, and a considerable mass of folk-tales. Valuable from a linguistic point of view, the songs have little merit of their own, and seem to be mainly echoes of Gentile strains. The folk-tales, however, would possibly repay a keener investigation than they have yet received. Alike in Wales and Turkey they may be identified with those of other Aryan races; scarce one has yet been published but its counterpart may be found in Grimm's, Ralston's, or other collections of European folk-lore. For instance Paspati's third story, taken down at Constantinople from a Gipsy professional *raconteur*, is unquestionably the same as Grimm's *Treuer Johannes*. Similarly in the Bukowina we meet with Romani versions of *Das tapfere Schneiderlein*, *Die zwei Brüder*, etc., whilst *Nazdrivánu* may be matched from Ralston's *Russian Folk-tales*, p. 73, and frequent mention is made of the waters of life and death, of hills that butt together like rams (*cf.* Ralston, p. 236), and of other features common in Slavonic folk-lore. This resemblance of Romani to Gentile stories may be explained (1) by the common origin of the Aryan races, (2) by the Gipsies having borrowed from the nations among whom they wander, or (3) by these nations having received their stories from the Gipsies. Probably all three explanations are true by turns, but the first is sometimes excluded by an identity of details too close to have been preserved through untold ages, and as to the second it is hard to see how a story current at Paderborn should have travelled eastward to Constantinople, especially as Paspati's tales, enshrining words and phrases otherwise obsolete, are plainly of some antiquity. Accordingly the third explanation, that the Gipsies may have carried *Treuer Johannes* and other stories westward with them, deserves consideration. Some of the Gaelic stories collected by Campbell were, it should be remarked, taken down from Tinklers; and from a London Gipsy he obtained a version of *The Master Thief*, which is current also among Roumanian Gipsies. At present our information is far too scanty to warrant a definite conclusion; but could it once be shown that the Asiatic possess the same stories as the European Gipsies, it might be necessary to admit that Europe owes a portion of its folk-lore to the Gipsies.[1]

*Religious Beliefs and Observances.*—"The Gipsies," says Grellmann, "brought no particular religion with them, but regulate themselves in religious matters according to the country where they live, . . . wherefore most writers place them below the heathens." This author notwithstanding, the Gipsies mix with their beginnings of Christianity or Mahometanism the relics of an older faith. *Devel*, their name for God or sky, is akin to the Sanskrit "God" (*cf. dyaus*, "sky") and the German Romani *Miro baro devel dela berschindo*, "my great God gives rain," *i. e.*, "it rains," preserves the original signification. *Gúriben*, "thunder" (lit. "bellowing of cattle"), is another reminiscence of nature worship; and *trúshul*, "cross" (Sanskrit *triśūla*, "the trident of Siva"), presents a curious instance of the transference of religious ideas. *Beng*, "devil," compared by Miklosich with the Sanskrit *bhēka*, "frog," is possibly a survival of serpent-worship, traces of which may be also found in various phrases, stories, emblems, and customs. Survivals also of phallic worship may probably be seen in the honor paid by the three great German Gipsy clans to the fir-tree, the birch, and the hawthorn (Liebich, p. 38); and in the veneration in which Welsh Gipsies hold the fasciated vegetable growth known as the *broado koro*. There are besides a number of other Gipsy superstitions interesting enough in themselves, but which lose their full significance by being at present isolated or insufficiently authenticated, such as, for instance, the alleged devotion of Norwegian Gipsies to a moon-god, Alako (Sundt, 105–10). In the *People of Turkey* (1878) the Tchinghianés are said to keep a fire continually burning in their camp; on the first of May to go all in a body to the sea-coast or banks of a river, where they thrice throw water on their temples, invoking the invisible *genii loci* to grant their special wishes; and annually to drink some potion, prepared in a way known only to the oldest and wisest of the tribe.

*Modes of Life.*—In Turkey, according to Paspati, the nomad Tchinghianés far outnumber the sedentary; but how far the same statement is true of Gipsies of other lands is hard to determine. Certain at least it is that in England few house-dwelling Gipsies are to be met with who do not remember that their forefathers followed a wandering life, or who do not themselves go temporarily under canvas as hop-picking or the great race-meetings come round. But though for centuries the tent has been the Gipsy's normal habitation, it would not seem to have been so always, if we look to the evidence of the Gipsy tongue. For had it been, assuredly the Romani name for "tent" would be everywhere the same, whereas the Persian Gipsy calls it *guri*, the nomad Tchinghiané *katúna* (modern Greek κατούνα), the sedentary *tchérga* (Turkish *cherkeh*), the Polish Gipsy *szater*, the German *tattin* (from *tatto*, "hot"), the English *tan*, etc. On the other hand, *ker*, "a house," occurs in every dialect. From the time, however, of Fitz-Simeon onwards Gipsies have everywhere been found dwelling in tents, and his description of these tents as "like those of the Arabs, low, black, and oblong," tallies with Mr. Boswell's:—

"The tents are made of rough blankets. They are nearly always brown ones, because the white blankets are not so good for the rain. First of all they measure the ground with a ridge-pole, then they take the kettle-prop and make the holes exactly opposite each other. Then they take up the ridge-pole and stick all the rods into it. Then there is a blanket that goes behind, and is pinned on with pin-thorns; next to that come the large ones over the top of all, also pinned with the same pins."

In the matter of dress, Mr. Crofton, in *Papers of the Manchester Literary Club* (1876), infers that "Gipsies formerly had a distinctive costume, consisting of a turban-like head-

[1] See Paspati (pp. 594–629), Miklosich (part iv.), Professor Friedrich Müller's *Beiträge zur Kenntniss der Rom-Sprache* (2 parts, Vienna, 1869–72), and Dr. Barbu Constantinescu's *Probe de Limba si Literatura Tiganilor din Romania* (Bucharest, 1878).

dress of many colors, together with a large cloak, worn after the fashion of a toga, over a long loose under-skirt." The Gipsies, however, of to-day can hardly be said to have a distinctive garb, though certain minutiæ of dress still render them easily recognizable. In Transylvania, for instance, their women's ear-rings differ in pattern from those of the natives; the Hungarian Gipsy chief wears silver buttons, bearing a serpent crest; and his old-fashioned English brother decks his Newmarket coat with spade-guineas or crown-pieces. The English Gipsy woman may be known by her bright silk handkerchief, her curiously-plaited hair, her massy rings, her coral or bead necklace, and by the *monging-guno*, a tablecloth arranged bagwise over her back. In August, 1878, Queen Victoria was welcomed to Dunbar by a Gipsy "queen," one of the Reynolds family, who was "dressed in a black robe with white silk trimmings, and over her shoulders wore a yellow handkerchief. Behind her stood two other women, one of them noticeable from her rich gown of purple velvet, and two stalwart men, conspicuous by their scarlet coats." On the other hand, the dress of the children upon the Continent is simple, not to say scanty.

Everywhere Gipsies ply an endless variety of trades. In Egypt they monopolize the art of serpent-charming; in France and Spain they sit as professional models; in England we meet Gipsy Methodist preachers, actors, quack doctors, chimney-sweeps, carpenters, factory hands, etc. But everywhere the men have three principal callings—workers in metals, musicians, and horse-dealers; everywhere the women are "pleasaunt dauncers" as in the days of Andrew Boorde, and by peddling and fortune-telling contribute their share—often more than their share—to the family purse. Gipsies have long been famous as copper and iron smiths in south-eastern Europe, where their horseshoes are reckoned unrivalled. The *calderari* (coppersmiths) of Hungary and Transylvania at certain intervals make trading tours to Germany, France, England, Norway, and even Spain and Algeria. The workers in iron, on the other hand, seldom or never quit the land of their adoption, as neither naturally do the few remaining *aurari*, or Gipsy gold-washers of Transylvania. Simson describes a primitive Tinkler method of smelting iron, and the caves of Granada still echo to the clink of Gipsy anvils; but in England the surname *Petulengro*, "smith" (from *petul*, "horseshoe"), alone recalls the days when Gipsies surpassed the Gentile in the farrier's craft. Liszt, in his work *Des Bohémiens et de leur Musique en Hongrie* (Paris, 1859), ascribes to the Gipsies the creation of Hungary's national music. Bartalus (1868) contests the theory, but few would hesitate to admit its plausibility who at the Paris Exhibition (1878) or elsewhere have listened to the Gipsies' thrilling performance of a *czardas*, or are familiar with the undoubted compositions of Bihary, Csermak, and other Gipsy *maestri*. The Gipsy's favorite instrument is the violin, but few are the instruments he has not successfully essayed. The Eisteddfods of Wales have witnessed the triumphs of Gipsy harpists; and hundreds have been charmed by the concerts of the Roberts family, not knowing they were hearing a Gipsy band. "The Egyptians," as Krantzius dryly remarked in 1520, "frequently change their horses;" horse-dealing and horse-stealing are too often synonymous terms with them. Fortune-telling is on the wane with Gentiles' waning belief in the fortune-teller's powers. The Gipsy crone can no longer persuade the yeoman's wife to bury her treasure in the earth, and return in a fortnight's time to find it—gone. Those halcyon days of *maánzin* are passed by; the servants' hall is now the only El Dorado left. Enclosure Acts have struck a deadly blow at English Gipsydom, driving the wanderers from breezy common and turf-edged lane to the smoky suburbs of great towns, or at best the outskirts of some watering place. Here, surrounded by Gentiles, the younger generation forget the wisdom of the Egyptians, relinquish time-honored customs, and, wedding with the sons and daughters of the land, widen the stream of Romani blood, and so diminish its "depth." Several accounts have been furnished of Romani marriages, but they rarely tally, and some (Bright's, Borrow's, and Simson's) do not bear quotation. On the Continent one common feature is the breaking by the chief of a flower-crowned pitcher, from whose fragments, as they are many or few, he argues the fortunes of the bridal pair. There are many curious Gipsy practices relating to death and burial, such as waking the corpse, burning the deceased's effects, the fasting of his kinsfolk, and a species of *tabu*. The earliest record of Gipsies burning the property of their dead occurs in the *Annual Register* for 1773, p. 142: "The clothes of the late Diana Boswell, queen of the Gipsies, value £50, were burnt in the Mint, Southwark, by her principal courtiers, according to ancient custom" (*cf.* Liebich, p. 55). Abstention from flesh or some other delicacy is not always a sign of mourning for the dead (*cf.* Crofton in *Papers of the Man. Lit. Club*, 1877); but its most interesting form is where a Gipsy wife or child for ever renounces the favorite delicacy of the dead husband or parent. Like motives prompt the dropping of the dead Gipsy's name entirely out of use, any survivors who happen to bear the same changing it to another. Much might be written of a kind of ceremonial purity prescribed by Gipsy law, and indicated in the language by the distinction between *chiklo*, "dirty," and *mokado*, "unclean." To wash a tablecloth with clothes is *mokado*, since it is connected with food; and a German Gipsy woman may not cook for four months after childbirth, while a vessel touched by the skirt of a woman's dress is held to be defiled. But with one other widespread practice we must take our leave of Gipsy customs, that, namely, of leaving at a cross-road a handful of grass or leaves, a heap of stones, a stick or some such mark (*patrin*, "leaf") to guide the stragglers of the band. See Liebich, p. 96, and Smart and Crofton, p. 199; and compare "Pola," in Sleeman's *Ramaseeana or a Vocabulary of the Thugs* (Calcutta, 1836).

*Character.*—The Gipsy character, strange medley of evil and of good, presents itself as black and hateful to the outside world, whilst to the Romani race it is all that is fair and lovable. "There's nothing worse than mumply Gentiles" is a saying often in Gipsy mouths, which affords a clue to much that is puzzling in the Gipsy's nature. He is at war with mankind, for centuries his oppressors, and, all being fair in war, may plunder and beguile at will, so that he be not caught. Gipsies' light-heartedness and courtesy are patent to all men; but only to true or adopted members of the tribe are their inmost hearts revealed. Their principal faults are childish vanity, professional cunning, indolence (caused by the absence of ambition), and a hot passionate temper. But they are as ready to forgive as they are quick to resent a wrong; and before implicit confidence their cunning gives place to inviolate honor, a fact borne strongly out by an incident in the *Life* of the actor Charles Mayne Young (p. 186, ed. 1871). Their family affection is intensely strong, prompting a parent never to chastise a younger child, a grown-up son meekly to take a thrashing from his father; and they are lavishly generous to such as are poorer than themselves, even though Gentiles. Their love of nature reveals itself in a hundred quaint, poetic phrases, in a familiarity with beasts and herbs; their love of dumb creatures in the number of their pets. Quick and versatile, all Gipsies readily adapt themselves to any state of life; they have so wonderful a gift of tongues that formerly it was reckoned against them for a proof of sorcery. That hitherto the race has produced, outside the realm of music, none but mute geniuses, is rather due to lack of education than of ability; but "Zingaro" seems to have only been a nickname of the Quentin Matsys of the South, Antonio Solario (1382–1455), and John Bunyan from parish registers does not appear to have had one drop of Gipsy blood (*cf. Notes and Queries*, 5th ser. vol. ii.).

*Physique.*—Outwardly as within Gipsies present strong contrasts, some being strangely hideous, others very beautiful, though not with a regular, conventional beauty. Finely proportioned, they are as a race of middle stature, but lithe and sinewy, insensible to cold or wet, capable of supporting great fatigue. They pride themselves on their small hands and feet; corpulence rarely occurs, and only with the older women. The hair, black or dark brown, inclines to coarseness, is often frizzled, and does not soon turn gray; the complexion, a tawny olive, was compared by the Plymouth Pilgrims (1622) to that of the Indians of North America. The teeth are of dazzling whiteness and perfect regularity, the cheekbones high; and the aquiline nose is overhung by a strongly-marked brow, knit often in deep lines of thought. But the most striking feature is the full, dark eye, now lustreless, then changing to an expression of mysterious, childlike sorrow, presently blazing forth with sudden passion. As is the case in other Oriental races, the Gipsies early develop and early fade. See, in the *Archiv für Anthropologie* (1872), M. Isidor Kopernicki's learned and exhaustive treatise on Gipsy craniology.

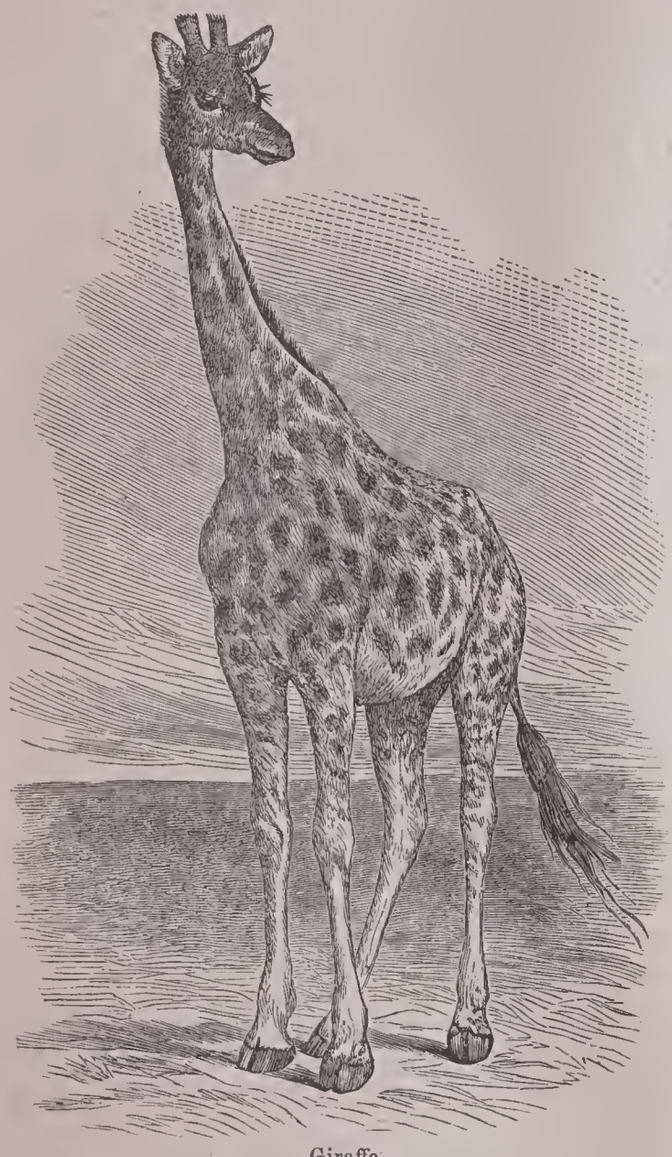
*Theories as to Origin.*—Several attempts have been made to identify Gipsies with nomad Indian tribes: Grellmann, for example, discovers them in the Sūdras, Richardson in the Nāts (*Asiatic Researches*, vol. vii. 1784), Leland in the Doms, and B. R. Mitra in the Bediyás (*Memoirs of London Anthrop. Soc.*, vol. iii. 1870). These theories, however, need not detain us long; they rest merely on analogies, real or imagined, between the manners of Gipsies and such Indian vagrants, and not on the evidence of language. Nor, were it even shown that any or all of these pariahs speak Romani among themselves, would such a discovery throw of necessity much light on the origin of our European Gipsies; it might simply prove that India has its Gipsy tribes. It is otherwise with the identification of Gipsies with the Jats, who in the Punjab alone numbered (1871) 1,309,399,—a theory started by Pott, elaborated by Bataillard, and supported by Newbold, Sir H. Rawlinson (*Proceedings of the Geogr. Soc.*, vol. i., 1857), Professor de Goeje (*Bijdrage tot de Geschiedenis der Zigeuners*, Amst., 1875), Captain Burton (*Academy*, March 27, 1875), and a writer in the *Edinburgh Review* (July, 1878). About 420 A.D., says Firdousi (*circa* 1000), the Persian monarch Behram Gur imported 10,000 minstrels from India, assigning them lands and cattle. But they, wasting their substance, angered the king, who bade them take their instruments, and roaming through the land procure by their songs a livelihood, "wherefore the *Lûri* now wander about the world." Hamza, the Arab historian of Ispahan (*c.* 940), had already told how Behram dispersed through the cities of his realm 12,000 Indian musicians, "whose descendants are known as *Zuth*;" and of three writers who repeat the tale Mirkhond (15th century) calls the musicians *Djatt*. Thus *Lûri* (mod. Pers. "Gipsy") appears to be synonymous with *Zuth* or *Jat*, the name on the one hand of Damascus Gipsies (?), on the other of an agricultural and cattle-breeding race inhabiting the valley of the Indus. Neither are records lacking of westward migrations of Jats from the Indus, as in 714 to Mopsuestia and Antioch, while in 810 we hear of them in the Tigris valley, in 834 in the marshes of Khuzistan, in 855 in the territory of the Byzantine empire (Goeje). Jat theorists differ as to the date of the great migration that gave Europe its Gipsies, the *Edinburgh Review* writer placing it at 1025, while Sir Henry Rawlinson regards our Gipsies as lineal descendants of Firdousi's Lûri. These writers, however, all agree in making the Gipsies Jats; but none have essayed the necessary comparison of Romani and Játakí (the idiom of the living Indian Jats), though Captain Burton himself has published a grammar of the latter in the *Journal of the Bombay Asiatic Society* (Bombay, 1849). We have seen that the dialect of the Turkish Gipsies has remained unchanged for near five centuries, and the Jats are said to "preserve their vernacular tongue wherever they go." Supposing Gipsies then to have broken off from the main Jat stem so late as the eleventh, or even as early as the fifth century A.D., we should look for a striking resemblance between Játakí and Romani. Compare, however, with the foregoing paradigms the following from Burton's grammar:—SING. nom. *ghorá*, "a horse;" gen. *ghore-dá;* dat. *ghore-nún;* acc. *ghorá;* abl. *ghore-te* or *-ton*, "from a horse;" PLUR. nom. *ghore;* gen. *ghorián* or *ghoren-dá;* dat. *ghorián nún*, etc. The Játakí third personal pronoun, again, runs:—SING. nom. *uha*, "he;" gen. *usadá;* dat. and acc. *usnún;* abl. *uste;* PLUR. nom. *uhe;* gen. *uhiudá*, etc.: its verbal formation is almost equally unlike the Romani. In the face of the great unlikeness of Romani and Játakí one may well concur with Bataillard in the rejection of this theory, and proceed to consider the later views of that writer as advanced in *Les Origines des Tsiganes* (Par. 1875), *Les Tsiganes de l'Age du Bronze* (Par. 1876), and *État de la question de l'ancienneté des Tsiganes en Europe* (Par. 1877). He now believes the Gipsies to have existed in Europe from immemorial times,—a conclusion to which he is led by the absence of any record of their passage across the Bosphorus, by their enslaved condition in Wallachia in the 14th century, by the casual notices cited above of their presence at a still earlier date, and by their present monopoly of metallurgical arts in South-Eastern Europe. These mainly negative proofs lose some of their force when we remark that neither is any record known to exist of the passage of Gipsies to England, Scotland, or America; and that at Corfu in 1346 (*i. e.*, in historic times) we read of Gipsies being reduced to vassalage. Assuredly it is a mighty leap from the Athingani of the 9th century A.D. to the Sigynnæ of Herodotus (v. 9), whom Bataillard claims for the ancestors of the Gipsy race. The strength, however, of the theory lies less in attempted identifications than in its explanation of the unsolved problem, What was the race that carried bronze to Northern and Western Europe? Referring for a general survey of the question to the article ARCHÆOLOGY, to E. Chantre's *Age de Bronze* (4 vols., Paris, 1877), and to Lubbock's *Prehistoric Times* (2d ed., London, 1869), we extract from the last-named work the following passages:—"The absence of implements made either of copper or tin seems to indicate that the art of making bronze was introduced into Europe, [a view confirmed by the fact that] wherever we find the bronze swords or celts they are the same, not similar in character, but identical. . . . The discovery of moulds proves that the art of casting in bronze was known and practised in many countries. Hence it appears most probable that the knowledge of metal is one of those great discoveries which Europe owes to the East. . . . The implements of bronze appear to have belonged to a race with smaller hands than those of the present European nation. . . . As regards the smallness of the hands, we must remember that Hindus share this peculiarity with Egyptians. . . . The Phœnicians were well acquainted with the use of iron. . . . We have still very much to learn in regard to the race by whom the knowledge of metal was introduced into our continent." Each passage suggests or is explained by the supposition that this was no other than the small-handed and eastern Gipsy race. The Calderari work exclusively in copper, never in iron; no Gipsy bronze-smith would have spoilt his trade by introducing iron. Traces might perhaps yet be found in Norway of the workings of a band of Calderari, who visited that country in 1874; and certainly the utensils they wrought in France were exactly similar to those that they wrought in Norway. Bataillard's theory is strengthened by the fact that so high an authority as M. de Mortillet—who is followed by Chantre and Burnouf—had been independently led to a like conclusion in 1874. Its strongest confirmation, however, is the important discovery of Dr. Kopernicki that in Eastern Galicia there survive to the present day certain *Zlotars* (Ruth. "goldsmiths"), Gipsy workers in bronze, whose processes Bataillard minutely describes in *Les Zlotars* (Paris, 1878). Difficulties there are in accepting the theory:—the unsettled question of the antiquity of the Romani tongue; the yawning chasm of a thousand years; above all, the unnoticed fact that nearly all the metallurgical terms of Romani seem to be borrowed from Greek—*kalái*, "tin" (καλαίον); *khárkoma*, "copper" (χάλκωμα); *molîv*, "lead" (μολύβιον); *kakkavî*, "kettle" (κακκάβη); *amunî*, "anvil" (ἀμόνι); *rin*, "file" (ῥινί); *sivrî*, "hammer" (σφυρί); *kerîlávi*, "pincers" (ξυλάβιον); *karfîn*, "nail" (καρφί); *klidî*, "key" (κλειδί); *gampána*, "bell" (καμπάνα); and *pétalo*, "horseshoe" (πέταλον). This looks like an insuperable objection, since certainly no Calderari of to-day would borrow from French or German the names for these the most familiar objects of his long-practised calling; and unless Bataillard be prepared to maintain that Greek took the terms from Romani, not *vice versa*, his theory falls.

*Bibliography.*—The literature on the Gipsies is richer in appearance than in reality. Miklosich (i. 54–59) and Bataillard (*Les derniers Travaux relatifs aux Bohémiens*, Paris, 1872) give the titles of 118 works, a number which might be largely increased. But many of these "works" are articles hidden away in periodicals, as "The English Gipsies," by the Rev. S. James, in *The Church of England Magazine*, 1875; many are mere *rechauffés* of earlier publications. Imperfect though it be, Grellmann's *Historischer Versuch über die Zigeuner* (1783; 2d and enlarged ed., Gött., 1787; Eng. translation by M. Raper, 1787) remains the only attempt at a full history of the Gipsy race; its grave deficiencies are best supplied by Sprengler's *Dissertatio historica-juridica de Cinganis sive Zigeunis* (Leyden, 1839), by Hopf's *Einwanderung der Zigeuner in Europa* (Gotha, 1870), by the historical portions of Miklosich's work, and above all by Bataillard's *De l'Apparition et de la Dispersion des Bohémiens en Europe* (Paris, 1844), *Nouvelles Recherches* (Paris, 1849), and *État de la Question*, etc. (Paris, 1877). On the language viewed as a whole the chief authorities are—*Die Zigeuner in Europa und Asien* (2 vols., Halle, 1844–45), by A. F. Pott; *Zigeunerisches* (Halle, 1865), by G. I. Ascoli; and *Ueber die Mundarten und die Wanderungen der Zigeuner Europa's* (8 parts, Vienna, 1872–78), and *Beiträge zur Kenntniss der Zigeunermundarten* (4 parts, Vienna, 1874–78), by F. von Miklosich. From works on the Gipsies of different European lands the following may be given as a selection (the more important being marked with an asterisk):—for Turkey, **Études sur les Tchinghianés* (Constan., 1870), by A. G. Paspati; for Roumania, the unsatisfactory *Grammaire, Dialogues, et Vocabulaire de la Langue des Cigains* (Paris, 1868), by J. A. Vaillant; for Hungary, *A' czigány nyelv elemei* (Pesth, 1853), by J. Bornemisza; for Bohemia, **Románi Czib* (Prague, 1821), by A. J. Puchmayer; for Germany, **Die Zigeuner in ihrem Wesen und ihrer Sprache* (Leipsic, 1863), by R. Liebich; for Poland, *Rys historiczny ludu cygánskiego* (Wilna, 1830), by T. Narbutt; for Russia, *Ueber die Sprache der Zigeuner in Russland* (St. Pet., 1853), by O. Böhtlingk; for Norway, *Beretning am Fante- eller Landstrygerfolket i Norge* (5 parts, Christian., 1850–65), by E. Sundt; for Denmark, *Tatere og Natmandsfolk i Danmark* (Copenh., 1872), by F. Dyrlund; for England, **The English Gipsies and their Language* (London, 1873), by C. G. Leland, *Romano Lavo-Lil: Word-book of the English Gipsy Language* (1874), by G. Borrow, and **The Dialect of the English Gipsies* (1875), by B. Smart and H. T. Crofton; for Scotland, *A History of the Gipsies* (London, 1865), by W. Simson; for Italy, *Zigeunerisches* (Halle, 1865), by Ascoli; for the Basque Country, *Vocabulaire de la Langue des Bohémiens habitant les Pays Basques Français* (Bord., 1862); for Spain, *The Zincali* (2 vols., Lond., 1841; new ed. 1873), by Borrow. From works on non-European Gipsies selection is unnecessary, since their sum total is as follows:—"Ueber die Sprache der Zigeuner in Syrien," by

Pott, in *Zeitschrift für die Wissenschaft der Sprache* (Berlin, 1846); *Reisen durch Syrien, Palästina,* etc. (Berlin, 1854), by U. J. Seetzen, containing a Syro-Romani vocabulary; * "The Gipsies of Egypt," in the *Journ. of the Roy. Asiatic Soc.* (Lond., 1856), by Captain Newbold, comprehending vocabularies from Egypt, Syria, and Persia; "Die Zigeuner in Ægypten," in *Petermann's Mittheilungen* (Gotha, 1862), by A. von Kremer; *Notes et Questions sur les Bohémiens en Algerie* (Paris, 1874), by P. Bataillard; and *Travels in the East* (Lond., 1823), by Sir W. Ouseley, vol. iii. of which gives a Karáchi vocabulary. To these may be added the specimens of the Gipsy dialects of Asia Minor, furnished by Paspati, and vocabularies from Armenia and Siberia in Miklosich's *Beiträge* (iv. pp. 38–41).

F. H. G.

GIRAFFE (*Camelopardalis giraffa*), a mammal belonging to the ruminant group of the Artiodactyle Ungulates, and the single living representative of the family *Camelopardalidæ*. Intermediate between the members of the deer and ox families the giraffe differs from both in having neither



Giraffe.

true horns nor antlers. It possesses however two solid, bony, and persistent appendages, attached partly to the frontal and partly to the parietal bones; and not to the former only as in the true horned ruminants, and these, unlike the processes of the latter, are distinct bones, separable, at least in the young animal, from those of the forehead. These horn-like peduncles are completely covered over by the skin of the forehead, and are terminated by a tuft of bristles, while in front of them there is a protuberance caused by a thickening of the bone, sufficiently prominent in the male to have been frequently described as a third horn. The giraffe is the tallest of existing animals, measuring usually from 15 to 16 feet high—the females being somewhat less—but attaining in the largest examples a height of 18 feet. This exceptional elevation is chiefly due to its great length of neck and limb, the cervical vertebræ, although only seven in number as in other mammals, being in this case exceedingly long. Its body is proportionately short, measuring only 7 feet between the breast and rump, and slants rapidly towards the tail—a peculiarity which has given rise to the erroneous impression that the fore legs of the giraffe are longer than the pair behind. Its feet terminate in a divided hoof, which, says Sir Samuel Butler, "is as beautifully proportioned as that of the smallest gazelle;" and the accessory hoofs found in most ruminants are entirely awanting. Its head is small, its eyes large and lustrous; and these, which give to the giraffe its peculiarly gentle appearance, are capable of a certain degree of lateral projection, which enable the creature without turning its head to see around and to a certain extent behind it. The elevated eyes of the giraffe thus enjoy a wider range of vision than those of any other quadruped. Its nostrils are provided with a peculiar mechanism of sphincter muscles, by which they can be opened or closed at will, and the animal is thus enabled to avoid the injurious effects of the sand storms which occasionally pass over its native haunts. Its tongue is remarkable for its great length, measuring about 17 inches in the dead animal, and for its great elasticity and power of muscular contraction while living. It is covered with numerous large *papillæ*, and forms, like the trunk of the elephant, an admirable organ for the examination and prehension of its food. The graceful appearance presented by the giraffe, to which it owes its name through the Arabian *Xirapha*, is greatly heightened by the orange-red color of its hide, mottled as it is all over with darker spots; while in its long tail, ending in a luxurious tuft of dark-colored hair, it possesses an admirable fly-whipper, without which it would probably be impossible for the giraffe to maintain its ground against the seroot fly and other stinging insects of central Africa. It lives on open plains in the neighborhood of low woods, high forest being scrupulously avoided, as depriving it of the extensive prospect which forms its chief defence against the attacks of its two great enemies—the lion and man. It feeds almost exclusively on the foliage of trees, showing a preference for certain varieties of mimosa, and for the young shoots of the prickly acacia, for browsing on which the prehensile tongue and large free lips of the giraffe are specially adapted. It is gregarious in its habits, living in small herds rarely of more than twenty individuals, although Sir S. Baker, who hunted it in Abyssinia, states that he has seen as many as a hundred thus herding together.

There is probably no animal more difficult of approach than the giraffe, owing to that exceeding wariness which prompts it to place sentinels to give the herd timely warning of approaching danger, as well as to its ability, from the elevated position of its eyes, and the openness of the ground it frequents, to see danger, and from its keenness of scent to smell it from afar. It is a fleet though by no means graceful runner, its awkward, shambling gait being due to its moving the fore and hind legs of the same side simultaneously. In hunting it on horseback the rule to be observed, according to the traveller already mentioned, is to press the giraffe the instant he starts; "it is the speed that tells upon him, and the spurs must be at work at the very commencement of the hunt, and the horse pressed along at his best pace; it must be a race at top speed from the very start, but should the giraffe be allowed the slightest advantage for the first five minutes the race will be against the horse." In pursuing it thus on horseback the experienced hunter avoids too close an approach to the creature's heels, a blow from which he has probably learnt to regard, with Dr. Livingstone, as leaving little to choose between it and "a clap from the arm of a windmill." Although trusting for safety to flight, it will, when brought to bay, even turn upon the lion; and not seldom does it defend itself successfully against his attacks by the vigorous blows of its powerful limbs. It is, however, powerless against the "king of beasts" when taken unawares, and with this object the latter lies in wait by the banks of streams, and springs upon the giraffe as it seeks to quench its thirst. In captivity it is said to make use of its skin-covered horns as weapons of defence, giving impetus to the blow, not by depressing and then elevating the head, as in the butting of an ox or sheep, but by a sidelong swing of its muscular neck. The skin of the giraffe is in many parts so thick that the bullet of the hunter often fails to pierce it, the surest method of hunting it being that pursued by the Hamran Arabs of Abyssinia, who run it down, and when galloping at full speed cut the tendons of its legs, or "hamstring" it, as this operation is called, with their broadswords, and thus completely disable it.

The giraffe is only found wild in Africa, where it ranges throughout the open country of Ethiopia as far south as the confines of Cape Colony. Until about fifty years ago it was almost totally unknown in Europe; it is now, however, to be found in most of the European zoological gardens, where it appears to thrive as well on corn and hay as on the mimosas of its native haunts. It also breeds freely in confinement, so that it may now be regarded as acclimatized in Europe. The giraffe family was more largely represented and enjoyed a wider distribution during the Miocene period, fossil remains of extinct species having been found in Greece and the Siwalik Hills; while an allied genus, *Helladotherium*, with less neck and more body than the existing giraffe, extended during the same period from the south of France to north-west India.

The skin of the giraffe forms a valuable leather material, that made from the thicker parts being in special request for sandals; its flesh, according to Sir S. Baker, was, when roasted, the best he had ever tasted; the tendons of its long legs are valued by the Arabs as thread for sewing leather, and as strings for their musical instruments; while its leg bones, which differ from those of other ruminants in being solid, are largely used in England in the manufacture of buttons and other articles of bone.

GIRALDI, Giglio Gregorio (1479–1552), or Lilius Gregorius Gyraldus, one of the scholars and poets of the golden age of Italian literature, was born June 14, 1479, at Ferrara, where he early distinguished himself by his talents and acquirements. On the completion of his literary course he removed to Naples, where he lived on familiar terms with Pontano and Sannazaro; and subsequently to Lombardy, where he enjoyed the favor of the Mirandola family. At Milan in 1507 he studied Greek under Chalcondylas; and shortly afterwards, at Modena, he became tutor to Ercole (afterwards Cardinal) Rangone. About the year 1514 he removed to Rome, where, under Clement VII., he held the office of apostolic protonotary; but having in the sack of that city (1527), which almost coincided with the death of Cardinal Rangone his most powerful patron, lost all his property, he returned in poverty once more to Mirandola, whence again he was driven by the troubles consequent on the assassination of the reigning prince in 1533. The rest of his life was one long struggle with ill health, poverty, and neglect; and he is alluded to with sorrowful regret by Montaigne in one of his *Essais* (i. 34), as having, like Sebastian Castalio, ended his days in utter destitution. He died at Ferrara in February, 1552; and his epitaph makes touching and graceful allusion to the sadness of his end. Giraldi was a man of very extensive erudition; and numerous testimonies to his profundity and accuracy have been given both by contemporary and by later scholars. His *Historia de Diis Gentium* marked a distinctly forward step in the systematic study of classical mythology; and by his treatises *De Annis et Mensibus*, and on the *Calendarium Romanum et Græcum*, he contributed to bring about the reform of the calendar, which was ultimately effected by Pope Gregory XIII. His *Progymnasma adversus Literas et Literatos* deserves mention at least among the curiosities of literature; and among his other works to which reference is still occasionally made are *Historiæ Poetarum Græcorum ac Latinorum; De Poetis suorum temporum;* and *De Sepultura ac vario sepeliendi ritu.* Giraldi was also an elegant Latin poet. His *Opera Omnia* were published at Leyden in 1696.

GIRALDI, Giovanni Battista (1504–1573), surnamed Cynthius, Cinthio, or Cintio, Italian novelist and poet, born at Ferrara in November, 1504, was educated at the university of his native town, where in 1525 he became professor of natural philosophy, and where, twelve years afterwards, he succeeded Celio Calcagnini in the chair of belles-lettres. Between 1542 and 1560 he acted as private secretary, first to Ercole II. and afterwards to Alphonso II. of Este; but having, in connection with a literary quarrel in which he had got involved, lost the favor of his patron in the latter year, he removed to Mondovi, where he remained as a teacher of literature till 1568. Subsequently, on the invitation of the senate of Milan, he occupied the chair of rhetoric at Pavia till 1573, when, in search of health, he returned to his native town, where on the 30th of December he died. Besides an epic entitled *Ercole* (1557), in twenty-six cantos, Giraldi wrote nine tragedies, the best known of which, *Orbecche*, was produced in 1541. The sanguinary and disgusting character of the plot of this play, and the general poverty of its style, are, in the opinion of many of its critics, almost fully redeemed by occasional bursts of genuine and impassioned poetry; of one scene in the third act in particular it has even been affirmed that, if it alone were sufficient to decide the question, the *Orbecche* would be the finest play in the world. Of the prose works of Giraldi the most important is the *Hecatommithi* or *Ecatomiti*, a collection of tales told somewhat after the manner of Boccaccio, but still more closely resembling the novels of Giraldi's contemporary, Bandello, only much inferior in workmanship to the productions of either author in vigor, liveliness and local color. Something, but not much, however, may be said in favor of their professed claim to represent a higher standard of morality. Originally published at Monteregale, Sicily, in 1565, they were frequently reprinted in Italy, while a French translation by Chappuys appeared in 1583, and one in Spanish in 1590. They have a peculiar interest to students of English literature, as having furnished, whether directly or indirectly, the plots of *Measure for Measure* and *Othello.* That of the latter, which is to be found in the *Hecatommithi* (iii. 7), is conjectured to have reached Shakespeare through the French translation; while that of the former (*Hecat.*, viii. 5) is probably to be traced to Wheatstone's *Promos and Cassandra* (1578), an adaptation of Cinthio's story, and to his *Heptamerone* (1582), which contains a direct English translation. To Giraldi also must be attributed the plot of Beaumont and Fletcher's *Custom of the Country.*

GIRALDUS CAMBRENSIS. See Barri.

GIRARD, Philippe Henri de (1775–1845), a celebrated French mechanician, was born at Lourmarin, in the department of Vaucluse, 1st Febuary, 1775. In his early life he manifested a strong aptitude for mechanical invention, and he also at that time devoted his attention to botany, painting, and literature. When at the Revolution his family took refuge in Italy he supported himself there for some time by painting, but afterwards, at the age of eighteen, he established a soap manufactory at Leghorn. Returning to France after the fall of Robespierre, he began to conduct a chemical work at Marseilles, but soon afterwards judged it prudent to go to Nice, where he obtained the professorship of chemistry and of natural history. Returning to Marseilles about 1800, he afterwards went to Paris, where, in company with his brother Frederick, he established a soap manufactory. In 1804 he and his brother took out a patent for what is known as the fountain lamp; and at the "Exposition" of 1806 he was awarded a gold medal for his one-cylindered direct acting steam engine. Napoleon having in 1810 decreed a reward of one million francs to whoever should invent a machine for the spinning of flax, equally successful with those in use for the spinning of hemp, Girard, after a course of experiments, invented and patented a flax-spinning machine. In 1813 he established a flax mill at Paris and another at Charonne, in both of which he made use of his machine; but although he was declared to have earned the reward offered for the invention the fall of Napoleon in 1815 left the decree unfulfilled. Girard, who expected that the expenses connected with his experiments would be met by the promised premium, now got into serious money difficulties, and had to leave France for Austria, where, besides establishing a flax mill at Hirtenberg, he built the first line of steam ships on the Danube. In 1825, at the invitation of the emperor Alexander I. of Russia, he went to Poland, where he erected a flax manufactory, round which grew up a village which received the name of Girardow. He was also appointed chief engineer of the mines of Poland. In 1844 he returned to Paris, and exhibited at the Exposition a large number of inventions, including a machine for combing flax, a machine for making gunlocks, several new improvements in guns, a piano of double octaves, and a new instrument called the *Tremolophone.* For his inventions connected with the manufacture of flax a gold medal was decreed to him by the jury; and in 1845 the Society of Inventions awarded him a sum which raised the pension he received from the Russian Government to 6000 francs. Besides the inventions already mentioned, Girard was the author of a large number of others, many of them of considerable importance in connection with various departments of industrial machinery. He died at Paris, August 26, 1845. A pension of 6000 francs was bestowed in 1857 on his only surviving brother, and another on his niece.

GIRARD, Stephen (1750–1831), American philanthropist, was born at Bordeaux on 21st May, 1750. At the age of thirteen he commenced life as a sailor, and followed his avocation with such assiduity that he was enabled, before the French requisitions of age and service allowed, to become master and captain, in October, 1773. His first mercantile venture was to San Domingo in February, 1774, whence he proceeded in July to the then colony of New York. After trading for three years between New York, New Orleans, and Port au Prince, he went to Philadelphia in May, 1777, and gave up the sea for a mercantile career. While he was engaged most successfully in the prosecution of an extensive trade, the yellow fever in its most malignant type broke out in Philadelphia, sweeping away one-sixth of its population. When, during its height, a hospital was established, for which it seemed almost impossible to secure competent management, Girard devoted himself personally, fearless of all risks, to the care of the sick and the burial of the dead, not only in the hospital, of which he became manager, but throughout the city, supplying the poorer sufferers with money and provisions. Two hundred children, made orphans by the ravages of the fever, were in a great measure thrown upon his care. From this period his success commercially and financially was unexampled. He gave a portion of his time to the management of municipal affairs for several years, and rendered efficient service as warden of the port and as director of many public institutions. On the dissolution of the Bank of the United States he instituted what is known now as the Girard Bank. During the war of 1812 "he rendered valuable services to the Government by placing at its disposal the resources of his bank at a time of difficulty and embarrassment, subscribing to a large loan which the Government had vainly sought to obtain." Girard added to his other avocations that of a practical agriculturist. He died December 26, 1831.

Girard College was founded by him for the education and support of the poor white orphans of his adopted city. His fortune amounted to about seven and a half millions of dollars. After specific legacies of two millions for the erection and endowment of the college, $140,000 to his relatives, $300,000 to the State for internal improvements, $500,000 to the city of Philadelphia to improve its eastern front, $116,000 to public charities, and various annuities and legacies, he bequeathed the residue of his estate to the city of Philadelphia, mainly for the improvement and maintenance of the college. The most minute directions were given by Girard in regard to the buildings to be erected, and the admission and management of the inmates. He specifically requires that the orphans be instructed in the purest principles of morality, so that on their entrance into active life they may evince benevolence towards their fellow creatures, and a love for truth, sobriety, and industry. As for religious belief, they are left to adopt such tenets as their matured reason may lead them to prefer; and to secure this he interdicts the employment, and even the admission into the grounds, of any ecclesiastic whatever.

GIRARDIN, Madame Émile de, a French authoress, was born at Aix-la-Chapelle, January 26, 1804, and died at Paris June 29, 1855. Her maiden name was Delphine Gay, and her mother, the well-known Madame Sophie Gay, brought her up in the midst of that brilliant literary society of which she was afterwards a conspicuous ornament. In 1822 she obtained peculiarly honorable mention from the Academy for a poem on the *Devotion of the Sisters of Sainte Camille at the Siege of Barcelona;* and not long after she published two volumes of miscellaneous pieces, *Essais poétiques* (1824) and *Nouveaux essais poétiques* (1825). A visit to Italy in 1827, during which she was enthusiastically welcomed by the literati of Rome and even crowned in the capitol, was productive of various poems, of which the most ambitious was *Napoline* (1833). Her marriage in 1831 to M. Émile Girardin[1] opened up a new literary career. The contemporary sketches which she contributed from 1836 to 1839 to the feuilleton of *La Presse*, under the *nom de plume* of Charles Delaunay, were collected under the title of *Lettres Parisiennes* (1843), and obtained a success which has proved as permanent as it was brilliant. But it was to more elaborate efforts that the authoress would have preferred to entrust her reputation, and she indeed confesses, in a half serious half mocking mood, that it was almost a disappointment to find herself famous for so slight a thing. To the close of her life she continued to appear both as a novelist and as a writer for the stage, and in both departments she reaped a wide popularity through the wit and emotional force of her productions. *Contes d'une vieille fille à ses neveux* (1832), *La canne de Monsieur de Balzac* (1836), and *Il ne faut pas jouer avec la douleur* (1853) are among the best known of her romances; and her dramatic pieces include *L'École des journalistes* (1840), *Judith* (1843), *Cléopatre* (1847), *C'est la faute du mari* (1851), *Lady Tartufe* (1853), *La joie fait peur* (1854), *Le chapeau d'un horloger* (1854), and *Une femme qui déteste son mari*, which did not appear till after the author's death. In the literary society of her time Madame Girardin exercised no small personal influence, and among the frequenters of her drawing-room were Gautier and Balzac, Alfred de Musset and Victor Hugo. During the latter years of her life a pensive melancholy gathered round her, for long years she had prayed the prayer of Hannah, and her woman's heart had not been comforted. Her collected works were published in six volumes, 1860–1861.

See Sainte-Beuve, *Causeries du lundi*, t. iii.; G. D. Molenès, "Les femmes poètes," in *Revue des Deux Mondes*, July, 1842; Taxile Delord, *Les Matinées littéraires*, 1860: *L'esprit de Madame Girardin, avec une préface par M. Lamartine*, 1862; G. d'Heilly, *Madame de Girardin, sa vie et ses œuvres*, 1868.

GIRARDIN, Saint-Marc (1801–1873), a politician and man of letters whose real name was Marc Girardin simply, was born at Paris in 1801 and died at Morsang-sur-Seine on the 11th of April, 1873. His school career at the Lycée Henri IV. was a distinguished one, and he afterwards took university honors both in literature and law, but he never practised at the bar. During the reign of Charles X. he obtained several Academy prizes, and a mastership at the Lycée Louis le Grand, though his liberal principles stood a little in his way. In 1828 he began to contribute to the *Journal des Débats*, on the staff of which he remained for nearly half a century. At the accession of Louis Philippe he was appointed professor of history at the Sorbonne and master of requests. Soon afterwards he exchanged his chair of history for one of literature, continuing to contribute political articles to the *Débats*, and sitting as deputy in the chamber from 1835 to 1848. As a professor he directed his efforts chiefly against the clerical reaction. In 1844 he was elected a member of the Academy. During the revolution of February, 1848, Girardin was for a moment a minister, but after the establishment of the republic he was not re-elected deputy, nor did he take any prominent part in politics during the second empire save with his pen. In the capacity of journalist he continued to be active, and interested himself not merely in moderate opposition to the Government at home but also in foreign politics, especially in the affairs of Syria, Greece, and Turkey. After the war of 1870 he was returned to the Bordeaux assembly by his old department—the Haute Vienne. His Orleanist tendencies and his objections to the republic were strong, and though he at first supported Thiers, he afterwards became a leader of the opposition to the president. He died, however, before Thiers was actually driven from power. Saint-Marc Girardin was one of the most distinguished of the many writers whose political and literary activities combined have raised them to distinction in France during this century, but to whom there cannot be assigned the highest rank either as politicians or as littérateurs. His political claims were not above those of a vigorous and intelligent journalist. His professorial lectures were popular and well attended; his literary knowledge was wide, and included German and Italian; his criticisms, on which his claims as a man of letters rest, were acute and well expressed, but not remarkable for great subtlety or novelty of thought or style.

His chief work is his *Cours de littérature dramatique* (1843–1863), a series of lectures the delivery and publication of which lasted for over twenty years. This work has for second title *De l'Usage des Passions dans le Drame*, which describes it more accurately. The author goes through the list of the various passions, and of the chief situations which call them out, discussing at the same time the mode in which they are treated in the most celebrated dramas of ancient and modern times. The source of these illustrations is not indeed limited to drama, and the lecturer takes a wide range over the fields of poetry and romance. The result was doubtless as a course of lectures interesting and stimulating; as a book it is somewhat desultory. Among his other works may be noticed *Essais de Littérature* (1844, 2 vols.), made up chiefly of contributions to the *Débats*, his

[1] [A natural son (1806–81) of a count, founder of *La Presse*, *La Liberté*, and *La France*, for a time a duellist, opposed Napoleon III., who temporarily exiled him, supported republicanism.—Am. Ed.]

*Notices sur l'Allemagne* (1834), and many volumes of collected *Souvenirs, Reflexions*, etc., on foreign countries and passing events. His latest works of literary importance were *La Fontaine et les Fabulistes* (1867) and an *Étude sur J. J. Rousseau* (1870) which had appeared in the *Revue des Deux Mondes*.

GIRARDON, François (1628–1715), a sculptor whose works are typically characteristic of the epoch of Louis XIV., was born at Troyes in 1628, and died in the Louvre in 1715. As a boy he had for master a joiner and wood-carver of his native town, Baudesson by name (*Arch. de l'Art Français*, v. 4), under whom he is said to have worked at the château of Liébault, where he attracted the notice of Chancellor Séguier. By the chancellor's influence Girardon was first removed to Paris and placed in the studio of François Anguier, and afterwards sent to Rome. In 1650 he returned to France, and seems at once to have addressed himself with something like ignoble subserviency to the task of conciliating Le Brun, who owed his start in life to the same patron. Girardon is reported to have declared himself incapable of composing a group, whether with truth or from motives of policy it is impossible to say. This much is certain, that a very large proportion of his work was carried out from designs by Le Brun, and shows the merits and defects of Le Brun's manner—a great command of ceremonial pomp in presenting his subject, coupled with a large treatment of forms which if it were more expressive might be imposing. The court which Girardon paid to the "premier peintre du roi" was rewarded. An immense quantity of work at Versailles was entrusted to him, and in recognition of the successful execution of four figures for the Bains d'Apollon, Le Brun induced the king to present his protegé personally with a purse of 300 louis, as a distinguishing mark of royal favor. In 1650 Girardon was made member of the Academy, in 1659 professor, in 1674 "adjoint au recteur," and finally in 1695 chancellor. Five years before (1690), on the death of Le Brun, he had also been appointed "inspecteur général des ouvrages de sculpture"—a place of power and profit. In 1699 he completed the bronze equestrian statue of Louis XIV., erected by the town of Paris on the Place Louis le Grand. This statue was melted down during the Revolution, and is known to us only by a small bronze model (Louvre) finished by Girardon himself. His Tomb of Richelieu (church of the Sorbonne) was saved from destruction by M. Alexandre Lenoir, who received a bayonet thrust in protecting the head of the cardinal from mutilation. It is a capital example of Girardon's work; but amongst other important specimens yet remaining may also be cited the Tomb of Louvois (St. Eustache), that of Bignon (St. Nicolas du Chardonneret), and decorative sculptures in the Galerie d'Apollon and Chambre du roi, in the Louvre. Although chiefly occupied at Paris, Girardon never forgot his native Troyes. In the Hôtel de Ville is still shown a medallion of Louis XIV., and in the church of St. Rémy a bronze crucifix of some importance, —both works by his hand. In 1850 M. Corrard de Breban, who has given much time to researches concerning artists native to the town of Troyes, published a *Notice sur la vie et les œuvres de Girardon*.

GIRDLE, a band of leather or other material worn round the waist, either to confine the loose and flowing outer robes so as to allow freedom of movement, or to fasten and support the garments of the wearer. In southern Europe and in all Eastern countries the girdle was and still is an important article of dress. Among the Romans it was used to confine the *tunica;* and so general was the custom that the want of a girdle was regarded as strongly presumptive of idle and dissolute propensities. It also formed a part of the dress of the Greek and Roman soldier; the phrase *cingulum deponere*, to lay aside the girdle, was as equivalent to quitting the service. It was used as now in the East to carry money in; hence *zonam perdere*, to lose one's purse.

Girdles and girdle-buckles are not found in early Celtic interments, nor are they frequent in Gallo-Roman graves. But in Frankish and Burgundian graves they are almost constantly present, often ornamented with plaques of bronze or silver, and the clasps and mountings chased or inlaid with various ornamental designs, occasionally including figures of the cross, and rude representations of Scripture subjects. In later times girdles are frequently represented on brasses and monumental effigies from the 12th to the 16th century. They were either of leather or of woven materials, often of silk and adorned with gold and gems. The mode in which they were worn is shown on the effigies; usually fastened by a buckle in front, the long free end of the girdle was passed up underneath and then down over the cincture, and through the loop thus formed the ornamented end hung down in front. Among the sumptuary regulations of Edward III. there were prohibitions against wearing girdles of gold and silver unless the wearer were of knightly rank or worth £200 a year. Similar regulations against extravagance in girdles are occasionally found to the 16th century. The brasses of the 15th century present many beautiful examples of ladies' girdles, which were often worn like that of the knight with the ornamental end hanging down in front, sometimes with both ends depending from a large clasp or ornamental fastening in the centre. Allusions to the girdle are common in the poetry of the 16th and 17th centuries. The purse, the dagger, the rosary, the pen and inkhorn and the bunch of keys were carried suspended from it, and hence it was an ancient custom for bankrupts or insolvent persons to put off and surrender their girdles in open court. It is recorded that the widow of Philip I., duke of Burgundy, renounced her right of succession by putting off her girdle upon the duke's tomb. The girdle, which was a very important element in the dress of the Levitical priesthood, does not appear as an ecclesiastical vestment in the Christian Church until the 8th century. Germanus, who died in 740, mentions the girdle worn by deacons; and Hrabanus Maurus in the succeeding century speaks of the girdle as one of the regular vestments, and refers to its symbolism. Some centuries later the church had to discountenance extravagance in this article of attire, and splendor in the decoration of girdles was denounced as secular and unbefitting the ecclesiastical character.

GIRGEH, Girga, or Jirjeh, a town of Upper Egypt, situated on the left bank of the Nile, about 9 miles north-west of the ancient city of Abydus. It owes its name to the Coptic monastery of St. George or Girgis, and is the seat of a Coptic bishop, possesses eight mosques and a Roman Catholic monastery which ranks as the oldest in Egypt, and numbers from 8000 to 10,000 inhabitants, of whom about 500 are Christians. For a long time it was the capital of the Sa'id, but this rank is now held by Soohag. The worst enemy of Girgeh is the river, which was a quarter of a mile to the east at the time of Pococke's visit, about 1740, but has gradually crept nearer, and is now slowly undermining the very site of the town.

GIRGENTI, a city in the south of Sicily, at the head of a province of its own name, occupies a fine position about 3 miles from the coast on a platform of Mount Camicus, more than 1100 feet above the level of the sea. It lies about 60 miles S. S. E. of Palermo, with which it is connected by a railway 90 miles long. As seen from the lower ground Girgenti presents a grandiose but sombre appearance, with its buildings rising in close array from ancient substructions and the steep rocks of the mountain; but within it is for the most part mean, monotonous, and melancholy, the streets with few exceptions being confined, irregular, steep, and ill-paved, and the houses all presenting the same grey-brown walls, the same reddish roofs, and the same narrow doors and narrow windows. The cathedral, begun in the 14th century, has still an impressive effect, in spite of the incongruous mixture of styles; but the interior is a typical specimen of modern rococo. The acoustic conditions are sufficiently peculiar: a word spoken in the softest whisper at the entrance can be distinctly heard behind the choir, 100 paces off. One of the chapels contains the shrine and bears the name of St. Gerlando, the first bishop of Girgenti; the altar-piece is a Virgin and Child, by Guido Reni; and in the north aisle there stands a marble sarcophagus now used as a font, with fine rilievos, probably of Roman workmanship after a Greek original, representing the story of Hippolytus and Phædra. Not only are the archives of the cathedral rich in historic documents of the Norman period, but they profess to contain an autograph letter of the devil himself. Among the other churches, upwards of forty in number, S. Maria dei Greci is worthy of note as preserving two Doric pillars which had belonged to the temple of Zeus Polieus, founded in 570 B. C. by Phalaris, and are thus the oldest architectural remains in Girgenti. As the chief town of a province, Girgenti is the residence of a prefect and the military headquarters of the district. It is also the seat of the wealthiest bishopric in Sicily, dating from the pontificate of Urban II.; and it possesses a chamber of commerce and art, an industrial institute, a lyceum, a gymnasium, a technical school, and an episcopal seminary. Its principal

library, Bibliotheca Lucchesiana, was presented to the town by Don Andrea Lucchese, of the family of Campo Franco; the Casino Empedocleo, with well-appointed library and reading-rooms, was founded by a number of the wealthier citizens. In the early part of the century Girgenti was a poverty-stricken town, but it has attained a considerable degree of prosperity since 1850. It lies in the centre of the sulphur district of Sicily, and its port, formerly Molo di Girgenti, now Porto Empedocle, is the principal place of shipment. The harbor has been largely improved since 1870: the pier, originally constructed in the 17th century, in part at least from the ruins of the temple of the Olympian Jupiter, has been extended to a length of 4800 feet, so as to include an area of 330,000 square yards, and the depth, which was only 10 feet on the bar and 16 within, has been greatly increased by dredging. Around the port, which is 3 miles from the city proper, has gathered a cluster of houses and stores, and the spot is defended by a small fort. Almonds and grain are the only important articles of export besides sulphur; but, though the grain-pits hewn out of the rock are of large extent, the actual shipments of grain are not very great. The average value of the annual export of sulphur amounted, between 1868 and 1870, to £411,700, while that of the other articles was less than £15,000 each. The population of Girgenti was 22,150 in 1901, and that of Porto Empedocle 11,455 In the history of Girgenti there is little of note; the historical interest of the district gathers round the splendid ruins of the older Agrigentum, which lie between Girgenti and the sea.

See Piccone, *Memorie storiche Agrigentine;* De La Salle's *Voyage pittoresque en Sicile;* Häckel's "Reiseskizzen aus Sicilien," in *Zeitschrift für Erdk. zu Berlin*, 1860; Renan, "Voyage in Sicile," in *Revue des Deux Mondes*, Nov, 1875.

GIRODET DE ROUSSY, Anne Louis (1767–1824), better known as Girodet-Trioson, was born at Montargis, January 5, 1767. He lost his parents in early youth, and the care of his fortune and education fell to the lot of his guardian, M. Trioson, "médecin de mesdames," by whom he was in later life adopted. After some preliminary studies under a painter named Luquin, Girodet entered the school of David, and at the age of twenty-two he successfully competed for the Prix de Rome. At Rome he executed his Hippocrate refusant les présents d'Artaxerxes, and Endymion dormant (Louvre), a work which was hailed with acclamation at the Salon of 1792. The peculiarities which mark Girodet's position as the herald of the romantic movement are already evident in his Endymion. The firm-set forms, the grey cold color, the hardness of the execution, are proper to one trained in the school of David, but these characteristics harmonize ill with the literary, sentimental, and picturesque suggestions which the painter has sought to render. The same incongruity marks Girodet's Danae, and his Quatre Saisons, executed for the king of Spain (repeated for Compiègne), and shows itself to a ludicrous extent in his Fingal (St. Petersburg, Leuchtenberg collection), executed for Napoleon I. in 1802. This work unites the defects of the classic and romantic schools, for Girodet's imagination ardently and exclusively pursued the ideas excited by varied reading both of classic and modern literature, and the impressions which he received from the external world afforded him little stimulus or check; he consequently retained the mannerisms of his master's practice whilst rejecting all restraint on choice of subject. The credit lost by Fingal Girodet regained in 1806, when he exhibited Scène de Deluge (Louvre), to which (in competition with the Sabines of David) was awarded the decennial prize. This success was followed up in 1808 by the production of the Reddition de Vienne, and Atala au Tombeau —a work which went far to deserve its immense popularity, by a happy choice of subject, and remarkable freedom from the theatricality of Girodet's usual manner, which, however, soon came to the front again in his Révolte de Caire (1810). His powers now began to fail, and his habit of working at night and other excesses told upon his constitution; in the Salon of 1812 he exhibited only a Tête de Vierge, in 1819 Pygmalion et Galatée showed a still further decline of strength; and in 1824—the year in which he produced his portraits of Cathelineau and Bonchamps—Girodet died on 9th December, aged fifty-seven.

The number of his paintings is inconsiderable; but he executed a vast quantity of illustrations, amongst which may be cited those to the Didot *Virgil* (1798) and to the Louvre *Racine* (1801–1805). Fifty-four of his designs for *Anacreon* were engraved by M. Chatillon. Girodet wasted much time on literary composition, his poem *Le Peintre* (a string of commonplaces), together with poor imitations of classical poets, and Essays on *Le Génie* and *La Grace*, were published after his death (1829), with a biographical notice by his friend M. Coupin de la Couperie; and M. Delécluze, in his *Louis David et son temps*, has also a brief life of Girodet.

GIRONDE, a maritime department in the S. W. of France, formed from four divisions of the old province of Guyenne, viz., Bordelais, Bazadais, and parts of Périgord and Agénois. It is bounded on the N. by the department of Charente-Inférieure, E. by those of Dordogne and Lot-et-Garonne, S. by that of Landes, and W. by the Bay of Biscay. It lies between 44° 12′ and 45° 35′ N. lat., and between 0° 18′ E. and 1° 16′ W. long, being 106 miles in length from N. W. to S. E., and 80 in breadth from N. E. to S. W. It takes its name from the river or estuary of the Gironde formed by the union of the Garonne and Dordogne. The department divides itself naturally into a western and an eastern portion. The former, which is termed *Les Landes*, occupies more than a third of the department, and consists chiefly of morasses, or of sandy and unfruitful downs. The downs stretching along the sea-coast have, however, been now planted with pines, which, binding the sand together by means of their roots, afford an efficacious protection against the encroachments of the sea. Near the coast are two extensive lakes, Carcans and Lacanau, communicating with each other, and with the bay of Arcachon, near the southern extremity of the department. The Bay of Arcachon contains numerous islands, and on the land side forms a vast shallow lagoon, a considerable portion of which, however, has been drained and converted into arable land. The eastern portion of the department consists chiefly of a succession of hill and dale, and, especially in the valley of the Gironde, is very fertile. The estuary of the Gironde is about 45 miles in length, and varies in breadth from 2 to 6 miles. The principal affluent of the Dordogne in this department is the Isle. The feeders of the Garonne are, with the exception of the Dropt, all small. West of the Garonne the only river of importance is the Leyre, which flows into the bay of Arcachon. The climate is humid and temperate. Wheat, rye, maize, millet, and hemp are grown to a considerable extent. The corn produced, however, does not more than half meet the wants of the inhabitants. The culture of the vine is by far the most important branch of industry carried on, the vineyards occupying about one-seventh of the surface of the department. The wine-growing districts are the Médoc, Graves, Côtes, Palus, and Entre-deux-Mers. The Médoc country grows the three *grands crus*. The Graves country forms a zone 30 miles in extent, and is situated in the vicinity of the Garonne and Dordogne, extending from Châtillon-sur-Gironde to Langon. This is the Sauterne country. The wines of the Côtes district are St. Émilion, Pommerol, St. Laurent, St. Hippolyte, St. Christophe, and St. George. The Palus and Entre-deux-Mers produce is inferior. Fruits and vegetables are increasingly cultivated, strawberries, cherries, apricots, prunes, artichokes, and peas being largely exported. Tobacco is also cultivated to a considerable extent. Large supplies of resin, pitch, and turpentine are obtained from the pine wood. There are stone quarries and smelting works, but few mines. The manufactures are various, and, with the general trade, are chiefly carried on at Bordeaux. Gironde is divided into the arrondissements of Bordeaux, Blaye, Lesparre, Libourne, Bazas, and La Réole, with 48 cantons, and 547 communes. The chief town is Bordeaux. The total area is 3761 square miles; and the population in 1866 was 701,855, and in 1901, 821,131. For a graphic description of the scenery of *Les Landes* in Gironde see the novel *Maître Pierre* of Edmund About.

GIRONDISTS. See France.

GIRVAN, a burgh of barony and market-town, in the county of Ayr, Scotland, is situated at the mouth of the river Girvan, 21 miles S. W. of Ayr, and nearly opposite Ailsa Craig, a rocky island 10 miles distant. The principal industry was formerly hand-loom weaving, but the number of persons so employed has decreased from 3000 to 300. Of late years the herring-fishing has been greatly developed in the spring of 1879, 304 boats were engaged in it, the "take" exceeding 20,000 crans. The harbor is a tidal one, with a depth at high-water of only 9 feet. The public buildings are very superior; and of late many handsome villas

have been erected. The situation of the town is one of the finest in the west of Scotland, and the shore affords excellent facilities for sea-bathing. The population, which was 7319 in 1851, had fallen to 4776 in 1871, but was 4872 in 1901.

GISORS, a town in France, department of Eure, is situated in a pleasant valley on the Epte, 45 miles E. N. E. of Paris. Of its ancient castle, which dates from the 12th century, and was at one time one of the principal strongholds in the kingdom, the octagonal keep, built by Henry II. of England, remains entire, and the rest of the ruins still present an imposing appearance. Its ancient ramparts have been converted into promenades. There is a fine old church, the choir of which was built in 1240, and contains windows with portraits of Blanche of Castile and Louis VIII. The north portal is a good specimen of the florid style of the Renaissance. The church contains some fine sculptures and paintings. The principal other buildings are the communal college, the convent, and the hospital. The industries include tanning, brewing, cotton-spinning, and bleaching. The population in 1901 was 4,281.

GITSCHIN, the chief town of a circle in Bohemia, is situated on the Cydlina and on the North-West Austrian railway, 50 miles N. E. of Prague. The principal buildings are the parish church, erected after the model of the pilgrim's church of Santiago de Compostella in Spain; the prison, formerly a Jesuit college; the castle, built by Wallenstein in 1630; the gymnasium, the normal school, and the real school. There is a considerable trade in corn. Gitschin was made the capital of the duchy of Friedland by Wallenstein in 1627, at which time it contained only 200 houses. Wallenstein was interred at the neighboring Carthusian monastery, but in 1639 the head and right hand were taken by General Banér to Sweden, and in 1702 the other remains were removed by Count Vincent of Waldstein to his hereditary burying ground at Münchengrätz. At Gitschin the Prusians gained a great victory over the Austrians, June 29, 1866. The population in 1900 was 9,790.

GIULIO ROMANO. See PIPPI.

GIUNTA PISANO, the earliest Italian painter whose name is found inscribed on an extant work, exercised his art from 1202 to 1236; he may perhaps have been born towards 1180 in Pisa, and died in or soon after 1236. There is some ground for thinking that his family-name was Capiteno. In recent times some efforts have been made to uphold his deservings as an artist, thereby detracting so far from the credit due to the initiative of Cimabue; but it cannot be said that these efforts rest on a very solid basis. To most eyes the performances of Giunta merely represent a continuing stage of the long period of pictorial inaptitude. The inscribed work above referred to, one of his earliest, is a Crucifix now or lately in the kitchen of the convent of St. Anne, in Pisa. Other Pisan works of like date are very barbarous, and some of them may be also from the hand of Giunta. It is said that he painted in the upper church of Assisi,—in especial a Crucifixion, dated 1236, with a figure of Father Elias, the general of the Franciscans, embracing the foot of the cross. In the sacristy is a portrait of St. Francis, also ascribed to Giunta; but it more probably belongs to the close of the 13th century. This artist was in the practice of painting upon cloth stretched on wood, and prepared with plaster.

GIURGEVO, in Roumanian *Giurgiu* or *Shursha*, a town of Roumania (formerly of Lower Wallachia), at the head of the district of Vlashka, lies on the left or northern bank of the Danube, over against Rustchuk in Bulgaria, and is distant about 40 miles from Bucharest, with which it has been connected by railway since 1869. It presents on the whole rather a mean appearance, rising out of the mud embankments of the river, but its population is increasing, its commercial advantages, as the port of Bucharest, are becoming more generally recognized, and improvements are consequently being effected in the town itself. It is the seat of a court of primary instance, and has a normal school and a gymnasium. The fortifications to which it was formerly indebted for no small part of its importance were destroyed in 1829, and its only defence is a castle on the island of Slobosia, with which it communicates by a bridge. Giurgevo, or, as it was called by its founders, San Zorzo, that is, San Giorgio, or St. George's, owes its origin to the Genoese of the 14th century. It has frequently figured in the wars whereby the lower Danube has so often been laid waste. The population in 1875 was about 15,000.

GIUSTI, GIUSEPPE (1809–1850), Tuscan satirical poet, was born at Monsummano, a small village of the Valdinievole, on May 12, 1809. His father, a cultivated and rich man, accustomed his son from childhood to study, and himself taught him, among other subjects, the first rudiments of music. Afterwards, in order to curb his too vivacious disposition, he placed the boy under the charge of a priest near the village, whose severity did perhaps more evil than good. At twelve Giusti was sent to school at Florence, and afterwards to Pistoia and to Lucca; and during those years he wrote his first verses. In 1826 he went to study law at Pisa; but, disliking the study, he spent eight years in the course, instead of the customary four. He lived gaily, however, though his father kept him short of money, and learned to know the world, seeing the vices of society, and the folly of certain laws and customs from which his country was suffering. The experience thus gained he turned to good account in the use he made of it in his satire.

His father had in the mean time changed his place of abode to Pescia; but Giuseppe did worse there, and in November, 1832, his father having paid his debts, he returned to study at Pisa, seriously enamored of a woman whom he could not marry, but now commencing to write in real earnest in behalf of his country. With the poem called *La Ghigliottina* (the guillotine), Giusti began to strike out a path for himself, and thus revealed his great genius. From this time he showed himself the Italian Béranger, and even surpassed the Frenchman in richness of language, refinement of humor, and depth of satirical conception. In Béranger there is more feeling for what is needed for popular poetry. His poetry is less studied, its vivacity perhaps more boisterous, more spontaneous; but Giusti, in both manner and conception, is perhaps more elegant, more refined, more penetrating. In 1834 Giusti, having at last entered the legal profession, left Pisa to go to Florence, nominally to practise with the advocate Capoquadri, but really to enjoy life in the capital of Tuscany. He fell seriously in love a second time, and, as before, was abandoned by his love. It was then he wrote his finest verses, by means of which, although his poetry was not yet collected in a volume, but for some years passed from hand to hand, his name gradually became famous. The greater part of his poems were published clandestinely at Lugano, at no little risk, as the work was destined to undermine the Austrian rule in Italy. After the publication of a volume of verses at Bastia, Giusti thoroughly established his fame by his *Gingillino*, the best in moral tone as well as the most vigorous and effective of his poems. The poet sets himself to represent the vileness of the treasury officials, and the base means they used to conceal the necessities of the state. The *Gingillino* has all the character of a classic satire. When first issued in Tuscany, it struck all as too impassioned and personal. Giusti entered heart and soul into the political movements of 1847 and 1848, served in the national guard, sat in the parliament for Tuscany; but finding that there was more talk than action, that to the tyranny of princes had succeeded the tyranny of demagogues, he began to fear, and to express the fear, that for Italy evil rather than good had resulted. He fell, in consequence, from the high position he had held in public estimation, and in 1848 was regarded as a reactionary. His friendship for the marquis Gino Capponi, who had taken him into his house during the last years of his life, and who published after Giusti's death a volume of illustrated proverbs, was enough to compromise him in the eyes of such men as Guerrazzi, Montanelli, and Niccolini. On May 31, 1850, he died at Florence in the palace of his friend.

The poetry of Giusti, under a light trivial aspect, has a lofty civilizing significance. The type of his satire is entirely original, and it had also the great merit of appearing at the right moment, of wounding judiciously, of sustaining the part of the comedy that "castigat ridendo mores." Hence his verse, apparently jovial, was received by the scholars and politicians of Italy in all seriousness. Alexander Manzoni in some of his letters showed a hearty admiration of the genius of Giusti; and the weak Austrian and Bourbon Governments regarded them as of the gravest importance.

His poems have been often reprinted, the best editions being those of Le Monnier of Florence, and also that published in Verona, with valuable annotations, by Professor Giovanni Fio-

retti in 1876. Besides the poems, and the proverbs already mentioned, we have a volume of select letters, full of vigor and written in the best Tuscan language, and a fine critical discourse on Giuseppe Parini, the satirical poet of the last century, whose poetical works are published in a volume by Le Monnier. In some of his compositions the elegiac rather than the satirical poet is seen. Many of his verses have been excellently translated into German by Paul Heyse. Good English translations were published in the *Athenæum* by the late Mrs. T. A. Trollope.

GIUSTINIANI, the name of a prominent Italian family which originally belonged to Venice, but established itself subsequently in Genoa also, and at various times had representatives in Naples, Corsica, and several of the islands of the Archipelago.

In the Venetian line the following are most worthy of mention. I. Lorenzo (1380–1465), the Laurentius Justinianus of the Roman Calendar, at an early age entered the congregation of the canons of Saint George in Alga, and in 1433 became general of that order. About the same time he was made by Eugenius IV. bishop of Venice; and his episcopate was marked by considerable activity in church extension and reform. On the removal of the patriarchate from Grado to Venice by Nicholas V. in 1451, Giustiniani was promoted to that dignity, which he held for fourteen years. He died on January 8, 1465, was canonized by Pope Alexander VIII., his festival (semiduplex) being fixed by Innocent XII. for September 5th, the anniversary of his elevation to the bishopric. His works, consisting of sermons, letters, and ascetic treatises, have been frequently reprinted—the best edition being that of the Benedictine P. N. A. Giustiniani, published at Venice in 2 vols. folio, 1751. They are wholly devoid of literary merit. His life has been written by Bernard Giustiniani, by Maffei, and also by the Bollandists. (2.) Leonardo (1388–1446), brother of the preceding, was for some years a senator of Venice, and in 1443 was chosen procurator of St. Mark. He translated into Italian Plutarch's *Lives of Cinna and Lucullus*, and was the author of some poetical pieces, amatory and religious, as well as of rhetorical prose compositions. (3.) Bernardo (1408–1489), son of Leonardo, was a pupil of Guarino and of George of Trebizond, and entered the Venetian senate at an early age. He served on several important diplomatic missions both to France and Rome, and about 1485 became one of the council of ten. His orations and letters were published in 1492; but his title to any measure of fame he possesses rests upon his history of Venice, *De Origine Urbis Venetiarum rebusque ab ipsa gestis historia* (1492), which was translated into Italian by Domenichi in 1545, and which at the time of its appearance was undoubtedly the best work upon the subject of which it treated. It is to be found in vol. i. of the *Thesaurus* of Grævius. (4.) Pietro, also a senator, lived in the 16th century, and wrote an *Historia rerum Venetarum* in continuation of that of Bernardo. He was also the author of chronicles *De Gestis Petri Mocenigi* and *De Bello Venetorum cum Carolo VIII.* The latter has been reprinted in the *Script. Rer. Ital.*, vol. xxi.

Of the Genoese branch of the family the most prominent members were the following. (1.) Paolo, di Moniglia (1444–1502), a member of the order of Dominicans, was, from a comparatively early age, prior of their convent at Genoa. As a preacher he was very successful, and his talents were fully recognized by successive popes, by whom he was made master of the sacred palace, inquisitor-general for all the Genoese dominions, and ultimately bishop of Scio and Hungarian legate. He was the author of a number of Biblical commentaries (no longer extant), which are said to have been characterized by great erudition. (2.) Agostino (1470–1536), was born at Genoa, and spent some wild years in Valencia, Spain. Having in 1487 joined the Dominican order, he gave himself with great energy to the study of Greek, Hebrew, Chaldee, and Arabic, and in 1514 commenced the preparation of a polyglot edition of the Bible. As bishop of Nebbio in Corsica, he took part in some of the earlier sittings of the Lateran council (1516–17), but in consequence of party complications, withdrew to his diocese, and ultimately to France, where he became a pensioner of Francis I., and was the first to occupy a chair of Hebrew and Arabic in the university of Paris. After an absence from Corsica for a period of five years, during which he visited England and the Low Countries, and became acquainted with Erasmus and More, he returned to Nebbio about 1522, and there remained, with comparatively little intermission, till in 1536, when, while returning from a visit to Genoa, he perished in a storm at sea. He was the possessor of a very fine library, which he bequeathed to the republic of Genoa. Of his projected polyglot only the Psalter was published (*Psalterium Hebræum, Græcum, Arabicum, et Chaldaicum*, Genoa, 1616). Besides the Hebrew text, the LXX. translation, the Chaldee paraphrase, and an Arabic version, it contains the Vulgate translation, a new Latin translation by the editor, a Latin translation of the Chaldee, and a collection of scholia. Giustiniani printed 2000 copies at his own expense, including fifty in vellum for presentation to the sovereigns of Europe and Asia; but the sale of the work did not encourage him to proceed with the New Testament, which he had also prepared for the press. Besides an edition of the book of Job, containing the original text, the Vulgate, and a new translation, he published a Latin version of the *Moreh Nevochim* of Maimonides (*Director Dubitantium aut Perplexorum*, 1520), and also edited in Latin the *Aureus Libellus* of Æneas Platonicus, and the *Timæus* of Chalcidius. His annals of Genoa (*Castigatissimi annali di Genova*) were published posthumously in 1537.

The name Giustiniani has also been borne by the following:—(1.) Pompeio (1569–1616), a native of Corsica, who served under Alessandro Farnese and the marquis of Spinola in the Low Countries, where he lost an arm, and, from the artificial substitute which he wore, came to be known by the soubriquet Bras de Fer. He also defended Crete against the Turks; and subsequently was killed in a reconnaissance at Friuli. He left in Italian a personal narrative of the war in Flanders, which has been repeatedly published in a Latin translation (*Bellum Belgicum*, Antwerp, 1609). (2.) Giovanni (1513–1556), born in Candia, translator of Terence's *Andria* and *Eunuchus*, of Cicero's *In Verrem*, and of Virgil's *Æncid*, l. viii. (3.) Orsatto (1538–1603), Venetian senator, translator of the *Œdipus Tyrannus* of Sophocles, and author of a collection of *Rime*, in imitation of Petrarch. He is regarded as one of the latest representatives of the classic Italian school. (4.) Geronimo, a Genoese, flourished during the latter half of the 16th century. He translated the *Alcestis* of Euripides and three of the plays of Sophocles; and wrote two original tragedies, *Jephte* and *Christo in Passione*. (5.) Vincenzo, who in the beginning of the 17th century built the Roman palace and made the art-collection which are still associated with his name (see *Galleria Giustiniana*, Rome, 1631). The collection was removed in 1807 to Paris, where it was to some extent broken up. In 1815 all that remained of it, about 170 pictures, was purchased by the king of Prussia and removed to Berlin, where it forms a portion of the royal museum.

GIVET, one of the strongest fortified towns of France, on the Belgian frontier, situated in the department of Ardennes, on the river Meuse, 40 miles N.N.E. of Mezières. The Eastern French railway connects it with Rheims, and the Belgian railways connect it with Namur and Charleroi. It is divided into three portions—the citadel called Charlemont, and Grand Givet on the left bank of the river, and on the opposite bank Petit Givet, connected with Grand Givet by a stone bridge of five arches. The citadel of Charlemont, built by the emperor Charles V. in 1555, is situated at the top of a precipitous rock 705 feet high, and on the east side, by which alone it is accessible, is fortified by six bastions and several other works. Grand Givet has four bastions and three ravelins, and Petit Givet three bastions. The fortress has accommodation for 25,000 men, but can be held by 3000 or 4000. The town is famed for its clay tobacco-pipes. There are also manufactures of nails, lead pencils, sealing wax, white lead, glue, earthenware, and leather, and the town has some trade. The population in 1901 was 4,833.

GIVORS, a town of France, department of Rhône, is situated on the Rhone and the canal of Rive-de-Gier, near the railway between Lyons and St. Étienne, 14 miles south of Lyons. It has glass and tile works, potteries, tanneries, foundries, silk factories, and dyeworks, and is the principal entrepôt for the coal and coke of the Gier valley. Near it are the ruins of the château of St. Gerald and of the convent of St. Ferréol. Population (1901), 10,980.

GLACIER,[1] a name given to a mass of ice, having its

[1] The following are synonyms in different languages and dialects:—French, *glacier;* German, *gletscher;* Italian, *ghiacciaja;* Tyrolese, *fern;* in Carinthia, *käss;* in the Valais, *biegno;* in part of Italy, *vedretto;* in Piedmont, *ruize;* in the Pyrenees, *serncille;* in Norway,

origin in the hollows of mountains where perpetual snow accumulates, but which makes its way down towards the lower valleys, where it gradually melts, until it terminates exactly where the melting, due to the contact of the warmer air, earth, and rain of the valley, compensates for the bodily descent of the ice from the snow reservoirs of the higher mountains.

The diminution of temperature as we ascend the slopes of mountains, is indicated by successive zones of vegetation, and finally by the occurrence of perpetual snow (see GEOLOGY, p. 249). It was first shown by Baron Humboldt and Von Buch that the limit of perpetual snow depends principally on the temperature of the summer, and not upon that of the whole year.

A glacier usually protrudes into a valley far below the limit of perpetual snow, and terminates amidst a wilderness of stones borne down upon its surface and deposited by its fusion. This earthy and rocky rubbish is termed moraine matter, and has already been described (GEOLOGY, p. 249). Lying in front of the lower end of a glacier, it marks in a characteristic and certain manner the greatest limit of extension which the glacier has at any one time attained. Sometimes a glacier is seen to have withdrawn very far within its old limits, leaving a prodigious barren waste of stones in advance of it, which, being devoid of soil, nourishes not one blade of grass. At other times the glacier pushes forward its margin beyond the limit which it has ever reached (at least within the memory of man), tears up the ground with its icy ploughshare, and shoves forward the yielding turf in wrinkled folds, uprooting trees, moving vast rocks, and scattering the walls of dwelling-houses in fragments before its irresistible onward march.[1]

The lower end of a glacier is usually steep,—sometimes with a dome-shaped unbroken outline, more frequently broken up by intersecting cracks into prismatic masses which the continued action of the sun and rain sharpen into pyramids, often assuming (as in the glacier of Bossons at Chamouni) grotesque or beautiful forms. From a vault in the green-blue ice, more or less perfectly formed each summer, the torrent issues which represents the natural drainage of the valley, derived partly from land springs, partly from the fusion of the ice. The united or crevassed condition of the glacier generally depends almost entirely on the slope of its bed. If it incline rapidly, numerous transverse fissures are formed from the imperfect yielding of the ice during its forced descent along its uneven channel. These cracks often extend for hundreds of yards, and may be hundreds of feet in depth; but their greatest depth is not accurately known, since they are rarely quite vertical. In many cases, however, the crevasses are comparatively few in number, and the glacier may be readily traversed in all directions. This is especially the case if a glacier of considerable dimensions meets with any contraction in its course. The ice is embayed and compressed, and its slope lessens, just as in the case of a river when it nears a similar contraction preceding a fall. Such level and generally traversable spaces may be found about the middle regions of the Mer de Glace, the lower glacier of Grindelwald, the lower glacier of the Aar, and in many other cases. The last-named glacier is perhaps the most remarkably even and accessible of any in Switzerland. The slope of its surface is in many places only 3°. The Pasterzen glacier in Carinthia is even less inclined. It is in such portions of a glacier that we commonly find internal cascades, or "moulins." These arise from the surface water being collected into a considerable mass by a long course over its unbroken surface, and then precipitated with violence into the first fissure it meets with. The descending cascade keeps open its channel, which finally loses the form of a fissure, presenting that of an open shaft, often of immense depth.

Nearly connected in their origin with the internal cascades are the "gravel cones," occasionally seen on the surface of glaciers, which appear to be formed in this way. A considerable amount of earthy matter derived by the superficial water-runs from the moraine accumulates in heaps in the inequalities of the ice, or at the bottom of the "moulins." As the glacier surface wastes by the action of the sun and rain, these heaps are brought to the surface, or rather the general surface is depressed to their level. If the earthy mass be considerable, the ice beneath is protected from the radiation of the sun and from the violent washing of the rain; it at length protrudes above the general level of the glacier, and finally forms a cone which appears to be entirely composed of gravel, but is in fact ice at the heart, with merely a protecting cover of earthy matter. These singular cones are very well seen on the glacier of the Aar, but on most others they are comparatively rare. The similar protective action of large stones detached from the moraines and lying on the surface of the ice often produces the striking phenomenon of "glacier tables." Stones of any considerable size almost invariably stand upon a slightly elevated pillar of ice; but when they are broad and flat they occasionally attain a height of 6 and even of 12 feet above the general level.

The superficial waste of a glacier is thus a very important phenomenon. Owing to it the body of the ice has its vertical thickness rapidly diminished during the heats of summer, and, as we have already intimated, the lower end of a glacier has its position determined by the amount of this waste. Suppose a glacier to move along its bed at the rate of 300 feet per annum, and imagine (merely for the sake of illustration) its yearly superficial waste to be 20 feet; then the thickness of the glacier will diminish by 20 feet for every 300 feet of its length, or at the rate of 360 feet per mile, so that the longitudinal section of a glacier has the form of a wedge; and however enormous its original thickness, after a certain course we must at length come to the thin end of the wedge, and that the more rapidly as the causes of melting increase towards the lower extremity. These causes are indeed so various that it is difficult to estimate them with accuracy. We have (1) the direct solar heat, (2) the contact of warm air, and (3) the washing of rain. All these causes act on the surface and produce the "ablation" of the surface. Besides these, the ice of the glacier wastes somewhat beneath by the contact of the soil and the washing of the inferior streams. This may be called its "subsidence." Further, the natural slope of the rocky bed of the glacier causes any point of the surface to stand absolutely lower each day in consequence of the progressive motion. These three causes united produce the "geometrical depression" of the surface. Principal J. D. Forbes showed how the several effects may usually be distinguished by observation. During the height of summer, near the Montanvert, he found the daily average ablation to be 3·62 inches, the daily subsidence to be 1·63 inches. Seven-tenths of the geometrical depression are due therefore to the former cause, and three-tenths to the latter. This is a very large amount, and it is certain that during the colder period of the year, and whilst the glacier is covered with snow, the subsidence is not only suspended, but the glacier recruits in thickness a portion of its waste during the seasons of summer and autumn. To this subject we shall again return.

The middle region of the great glaciers of the Alps extends from the level of about 6000 to 8000 feet above the sea. The inclination is usually there most moderate—say from 2½° to 6°. But this is not invariably the case. Beyond 8000 feet we reach the snow-line. The snow-line is a fact as definite on the surface of a glacier as on that of a mountain, only in the former case it occurs at a somewhat lower level. It cannot be too distinctly understood that the fresh snow annually disappears from the glacier proper. Where it ceases entirely to melt, it of course becomes incorporated with the glacier. We have therefore arrived at the region where the glacier *forms;* everywhere below it only *wastes.* This snowy region of the glacier is called in French *névé*, in German *firn.* As we ascend the glacier it passes gradually from the state of ice to the state of snow. The superficial layers are more snowy and white, in fact nearly pure snow; the deeper ones have more color and consistence, and break on the large scale into vast fragments, which at Chamouni are called *seracs.* The *névé* moves, as the glacier proper does, and it is fissured by the inequalities of the ground over which it passes. These fissures are less regular than those of the lower glacier. They are often much wider, in fact, of stupendous dimensions, and, being often covered with treacherous snowy roofs, constitute one of the chief dangers of glacier travelling. The constitution of the *névé* may be well studied on the Glacier du Géant,

*isbræ* or *isbrede;* in Lapland, *geikna* or *jegna;* in Iceland, *jökull* or *fall-jökull.*

[1] Such a sudden and disastrous increase took place in many of the glaciers of Switzerland and Savoy in 1818 (occasioning the catastrophe of the Val de Bagnes), and in those of the Bergenstift in Norway about 1740. The retreat of a glacier far within its old moraines is well exemplified in most of the glaciers of the latter country, and especially in that of Nygaard.

a tributary of the Mer de Glace. The mountain-clefts in which large glaciers lie usually expand in their higher portions (in conformity with the ordinary structure of valleys) into extensive basins in which snow is perpetual, and which therefore contain the *névé*, the true origin and material of the glacier, which is literally the overflow of these snowy reservoirs. The amount of overflow, or the discharge of the glacier—upon which depends the extent of its prolongation into the lower valleys—depends in its turn on the extent of the *névé* or collecting reservoir. Glaciers with small reservoirs of necessity perish soon. Their thickness being small, the wedge of the glacier soon thins out. They are common in confined *cirques* of the higher mountains. Such are the glaciers of the second order described by De Saussure. Their slope is often very great—from 20° to 40°.

The ice of the glacier proper has a very peculiar structure, quite distinct from the stratification of the snow on the *névé* (the relics of its mode of deposit), and one which requires special notice. When we examine the appearance of the ice in the wall of an ordinary crevasse (especially if it be tolerably near the side of the glacier) we are struck with the beautiful vertically laminated structure (first observed by Principal Forbes) which it commonly presents, resembling delicately veined marble (especially the variety called in Italy *cipollino*), in shades varying from bluish-green, through green, to white. When we trace the direction of the planes constituting the laminated structure, by observing them on the surface of the glacier (where they are usually well seen after rain, or in the channels of superficial water-runs), we find that where best developed (or not very far from the sides of the glacier) these laminæ are nearly parallel to the sides, but rather incline from the shore to the centre of the ice stream as we follow the declivity of the glacier.

Forbes found that certain superficial discolorations in the form of excessively elongated hyperbolas are due to the recurrence (at intervals of some hundred feet along the course of the glacier) of portions of ice in which the veined structure is more energetically developed than elsewhere, and where, by the decomposition of the softer laminæ, portions of sand and dirt become entangled in the superficial ice, and give rise to the phenomena of "dirt bands," which thus at a distance display (though in a manner requiring some attention to discover) the exact course of this singular structure on the surface of the glacier. Fig. 1 displays the superficial form of the dirt bands, and the course of the structural laminæ projected horizontally. Fig. 2 shows an ideal transverse section of the glacier, and fig. 3 another vertical section parallel to its length. These three sections in rectangular planes will serve to give a correct idea of the course of this remarkable structure within the ice, but a more popular conception will be formed of it from the imaginary sections of a canal-shaped glacier in fig. 4. The structure of the compound glacier, originally double, becomes gradually single; and the "frontal dip" of the laminæ at the loop of the horizontal curves, which in the upper region is nearly vertical, gradually slopes forwards until at the lower termination it has a very slight dip in-

Fig. 1.

Fig. 2.

Fig. 3.

wards, or indeed may be reversed and fall outwards and forwards. The general form of a structural lamina of a glacier rudely resembles that of a spoon.

This structure and the accompanying dirt bands have been recognized by different observers in almost all glaciers, including those of Norway and of India. The interval between the dirt bands has been shown in the case of the Mer de Glace (and therefore probably in other cases) to coincide with annual rate of progression, and in the higher parts of the glacier (towards the *névé*) to be accompanied by wrinkles or inequalities of the surface which are well marked by the snow lying in them during the period of its partial disappearance.

*The Motion of Glaciers and its Causes.*—There is something about a glacier which almost inevitably conveys to the mind the idea of a stream. This may be traced in the descriptions of unscientific tourists, of poets, and of some of those who have addressed themselves more seriously to the question of the real nature of these bodies. To the latter class of observers belong Captain Basil Hall and Monseigneur Rendu, bishop of Annecy, who had much more than hinted at the possibility of a true mechanical connection between the descent of a glacier and that of a mountain

Fig. 4.

torrent, or of a stream of lava. But until the actual conditions of motion were reduced to rule, it was impossible to know how far the analogy was real.

The most characteristic and remarkable feature of glaciers is their motion downwards from the *névé* towards the lower valley. The explanation of it is by far the most important application of mechanical physics connected with the subject. The principal theories to account for the progressive motion of glaciers which were prevalent previous to 1842 may be briefly characterized as De Saussure's and De Charpentier's, though each had been maintained long before by the earlier Swiss writers. The first may be called the *gravitation* theory, the latter the *dilatation* theory. Both suppose that the motion of the ice takes place by its sliding bodily over its rocky bed, but they differ as to the force which urges it over the obstacles opposed by friction and the irregularities of the surface on which it moves.

The following quotation from De Saussure explains his views with his usual precision:—"These frozen masses, carried along by the slope of the bed on which they rest, disengaged by the water (arising from their fusion owing to the natural heat of the earth) from the adhesion which they might otherwise contract to the bottom—sometimes even elevated by the water—must gradually slide and descend along the declivity of the valleys or mountain slopes (*croupes*) which they cover. It is this slow but continual sliding of the icy masses (*des glaces*) on their inclined bases which carries them down into the lower valleys, and which replenishes continually the stock of ice in valleys warm enough to produce large trees and rich harvests." Very sufficient objections have been urged against this theory. It is evident that De Saussure considered a glacier as an accumulation of icy fragments, instead of a great and continuous mass, throughout which the fissures and "crevasses" bear a small proportion to the solid portion; and that he has attributed to the subglacial water a kind and amount of action for which there exists no sufficient or even probable evidence. The main objection, however, is this, that a sliding motion of the kind supposed, if it commence, must be accelerated by gravity, and the glacier must slide from its bed in an avalanche. The small slope of most glacier-valleys, and the extreme irregularity of their bounding walls, are also great objections to this hypothesis.

The dilatation theory ingeniously meets the difficulty of the want of a sufficient moving power to drag or shove a glacier over its bed, by calling in the well-known force with

which water expands on its conversion into ice. The glacier being traversed by innumerable capillary fissures, and being in summer saturated with water in all its parts, it was natural to invoke the freezing action of the night to convert this water into ice, and by the amount of its expansion to urge the glacier onwards in the direction of its greatest slope. In answer to this, it is sufficient to observe, in the first place, that during the height of summer the portions of those glaciers which move fastest are never reduced below the freezing point, and that, even in the most favorable cases of nocturnal radiation producing congelation at the surface, it cannot (by well-known laws of conduction) penetrate above a few inches into the interior of the glacier. Again, the ascertained laws of glacier-motion are (as will be immediately seen) entirely adverse to this theory, as it is always accelerated by hot weather and retarded by cold, yet does not cease even in the depths of winter.

It is singular how slow observers were to perceive the importance to the solution of the problem of glacier-motion of ascertaining with geometrical precision the amount of motion of the ice, not only from year to year, but from day to day, in summer and winter, whether constant or variable at the same point, whether continuous or by starts; if variable, on what circumstances it depended, and in what manner it was affected at different points of the length and breadth of a glacier.

This method of studying the question was taken up by Forbes. His observations were commenced on the Mer de Glace of Chamouni, in June, 1842. Between the 26th and 27th of that month the motion of the ice opposite a point called the "Angle" was found, by means of a theodolite, to be 16·5 inches in 26 hours; between the 27th and 28th, 17·4 inches in 25½ hours; and from about 6 A.M. to 6 P.M. on the 28th the motion was 9·5 inches, or 17·5 inches in 24 hours; whilst the proportional motion during even an hour and a half was observed. No doubt could therefore remain that the motion of the ice is continuous and tolerably uniform—in short, that it does not move by jerks. He also ascertained about the same time that the motion of the ice is greatest towards the centre of a glacier and slower at the sides, contrary to an opinion then maintained on high authority. He next found that the rate of motion varied at different points of the length of the same glacier, being on the whole greatest where the inclination of its surface is greatest. As the season advanced, he observed notable changes in the rate of motion of the same part of the ice, and connected it by a very striking direct relation with the temperature of the air. These facts were established during the summer of 1842, and promptly published. By means of occasional observations during the following winter and spring by his guide, Auguste Balmat of Chamouni, and by a more full comparison of the entire motion of a glacier for twelve months with its motion during the hot season of the year, another generally received error was rectified: the motion of the glacier continues even in winter, and it has a very perceptible ratio to the summer motion. Last of all, it was found that the surface of a glacier moves faster than the ice nearer the bottom or bed.

These, and some minor laws of motion, being undoubted expressions of the way in which glaciers move, were formulated by Forbes in an approximate theory: "A glacier is an imperfect fluid or a viscous body, which is urged down slopes of a certain inclination by the mutual pressure of its parts." The analogy subsisting between the motion of a glacier and that of a river (which is a viscous fluid,—were it not so, its motion would be widely different) will be best perceived by stating more precisely its laws of motion.

1. Each portion of a glacier moves, not indeed with a constant velocity, but in a continuous manner, and not by sudden subsidences with intervals of repose. This, of course, is characteristic also of a river.

2. The ice in the middle part of the glacier moves much faster than that near the sides or banks; also the surface moves faster than the bottom. Both these facts obtain in the motion of a river in consequence of the friction of the fluid on its banks, and in consequence also of that internal friction of the fluid which constitutes its viscosity.

Thus, at four stations of the Mer de Glace, distant respectively from the west shore of the glacier.....100 230 405 365 yds., the relative velocities were.....1·000 1.332 1·356 1·367.

3. The variation of velocity (as in a river) is most rapid near the sides, whilst the middle parts move nearly uniformly. This and the preceding laws are also fully brought out by the subsequent experiments of M. Agassiz on the glacier of the Aar, and of MM. Schlagintweit on the Pasterzen glacier.

4. The variation of velocity of a glacier from the sides to the middle is nearly in proportion to the absolute velocity of the glacier,—whether that absolute velocity change in the same place in consequence of change of season, or between one point and another of the length of the same glacier, depending on its declivity. See (5) and (6) below.

5. The glacier, like a stream, has its pools and its rapids. Where it is embayed by rocks it accumulates, its declivity increases, and its velocity at the same time. When it passes down a steep, issuing by a narrow outlet, its velocity increases. Thus the approximate declivities of the inferior, middle, and superior regions of the Mer de Glace (taken in the direction of its length) are..... .....15° 4½° 8°, and the relative velocities are as the numbers..1·398 ·574 ·925.

6. A fact not less important than any of the preceding is that increased temperature of the air favors the motion of the ice, and generally whatever tends to increase the proportion of the watery to the solid constituents of a glacier, as mild rains, and especially the thawing of the superficial snow in spring. The velocity does not, however, descend to zero even in the depth of winter. Indeed, in the lower and most accessible portions of the Mer de Glace (or Glacier des Bois) and the Glacier des Bossons, the ratio of the winter to the summer motion is almost exactly 1 : 2. On endeavoring to establish a relation between the velocity of the glacier and the temperature of the ambient air, we find that these diminish together almost regularly down to the freezing point, below which the velocity seems to remain constant.

Any mechanical theory of glaciers must be more or less imperfect which does not explain the remarkable veined or ribboned structure of the ice, with its peculiar course through the interior of the glacier, as above described. According to Forbes the fundamental idea is that the veined or ribboned structure of the ice is the result of internal forces by which one portion of ice is dragged past another in a manner so gradual as not necessarily to produce large fissures in the ice, and the consequent sliding of one detached part over another, but rather the effect of a general bruise over a considerable space of the yielding body. According to this view, the delicate veins seen in the glacier, often less than a quarter of an inch wide, have their course parallel to the direction of the sliding effort of one portion of the ice over another. Amongst other proofs of this fundamental conception that the veined structure is the external symbol of this forced internal motion of a body comparatively solid, Forbes cited a striking instance from the glacier of La Brenva, on the south side of Mount Blanc. In this case the ice of the glacier, forcibly pressed against the naked rocky face of an opposing hill is turned into a new direction; and in thus shoving and squeezing past a prominence of rock, he observed developed in the ice a "veined structure" so beautiful that "it was impossible to resist the wish to carry off slabs, and to perpetuate it by hand specimens." This perfectly developed structure was visible opposite the promontory which held the glacier in check, and past which it struggled, leaving a portion of its ice completely embayed in a recess of the shore behind it. Starting from this point as an origin, the veined laminæ extended backwards and upwards into the glacier, but did not spread laterally into the embayed ice. They could, however, be traced from the shore to some distance from the promontory into the icy mass. The direction of lamination exactly coincided with that in which the ice must have moved if it was shoved past the promontory at all. That it did so move was made the subject of direct proof, by fixing two marks on the ice opposite the promontory, one on the nearer, the other on the farther side of the belt of ice which had the lamination best developed. The first mark was 50 feet from the shore, and moved at the rate of 4·9 inches daily; the other mark was 170 feet further off, and moved almost three times faster, or 14·2 inches daily. Throughout this breadth of 170 feet there was not a single longitudinal crevasse which might have facilitated the differential motion. A parallelogram of compact ice, only 170 feet wide, was therefore moving in such a manner that, whilst one of its sides advanced only a foot, the other advanced a yard. No solid body, at least no rigid solid body, can advance in such a manner; Forbes therefore concluded that glacier-ice is plastic, that the veined structure is unquestionably the result of the struggle between the rigidity of the ice and the quasi-fluid character of the motion impressed upon it, and that this follows, not only from the direction of the laminæ, but from their becoming distinct exactly in proportion to their nearness to the point where the bruise is necessarily strongest. The subsequent experi-

ments of Sorby on the cleavage structure of rocks proved that it has arisen as the result of intense lateral compression, and could be imitated in many artificial substances. Tyndall obtained it even in beeswax, the analogy between which and the veined structure of ice is very close.

Though Forbes termed his expression of the laws of glacier motion the "viscous" or "plastic theory," it was rather a statement of fact than an explanation of the physical processes concerned in the descent of glaciers. Against his views it was of course objected that ice is by its nature a brittle solid, and not sensibly possessed of any viscous or plastic quality. But he cogently replied that the qualities of solid bodies of vast size, and acted on by stupendous and long-continued forces, cannot be estimated from experiments on a small scale, especially if short and violent; that sealing-wax, pitch, and other similar bodies mould themselves, with time, to the surfaces on which they lie, even at atmospheric temperatures, and whilst they maintain, at the same time, the quality of excessive brittleness under a blow or a rapid change of form; that even ice does not pass at once, and *per saltum*, from the solid to the liquid state, but absorbs its latent heat throughout a certain small range of temperature (between 28°·4 and 32° of Fahrenheit), which is precisely that to which the ice of glaciers is actually exposed; that, after all, a glacier is not a crystalline solid, like ice tranquilly frozen in a mould, but possesses a peculiar fissured and laminated structure, through which water enters (at least for a great part of the year) into its intrinsic composition. He insisted that the quasi-fluid or viscous motion of the ice of glaciers is not a theory but a fact. A substance which is seen to pour itself out of a large basin through a narrow outlet without losing its continuity; the different parts of which, from top to bottom, and from side to centre, possess distinct though related velocities; which moves over slopes inconsistent with the friction between its surface and the ground on which it rests; which surmounts obstacles, and even if cleft into two streams by a projecting rock, instead of being thereby anchored as a solid would necessarily be, reunites its stream below, and retains no trace of the fissure, leaving the rock an islet in the icy flood,—a substance which moves in such a fashion cannot, Forbes maintained, in any true sense of the word, be termed a rigid solid, but must be granted to be ductile, viscous, plastic, or semifluid, or to possess qualities represented by any of these terms which we may choose to adopt as least shocking to our ordinary conception of the brittleness of ice.

The problem of the cause of glacier-motion cannot yet be considered to be satisfactorily solved. One of the most important contributions to the solution of this question was made by Professor James Thomson when he predicted that the freezing point of ice must be lowered by pressure, and when he sought by means of this property to explain the plastic or viscous behavior of glaciers contended for by Forbes. This prediction was experimentally verified by his brother, Sir W. Thomson. Tyndall subsequently to Forbes's work brought forward an explanation termed the "pressure or fracture and regelation theory." Some experiments of Faraday in 1850 had shown that two pieces of ice with moistened surfaces would if in contact adhere, owing to the freezing of the thin film of water between them, while at a lower temperature than 32°, and with consequently dry surfaces, no adhesion took place. The freezing was obtained even under warm water. Starting from those observations Tyndall was led to make experiments on the effects of compression upon ice, and found that a quantity of pounded ice could be moulded into a compact homogeneous mass. This property possessed by ice of reuniting by pressure after fracture was termed regelation, and was applied by Tyndall in explanation of the motion of glaciers. He maintained that the ice of a glacier is a solid brittle substance, and that its descent down a valley is due to constant rupture produced by the effects of gravitation and to the consequent sliding forward of the mass in which the surfaces of fracture speedily reunite. He pointed more particularly to the ice-falls of glaciers where the ice in passing over a steep descent and undergoing great tension does not yield as a viscous body, but is fractured as a solid. More recently Canon Moseley investigated the physics of glaciers, especially by determining the shearing force of the ice. He found that in a glacier of such a uniform section and slope, moving at such a uniform rate, as the Mer de Glace at Les Ponts, the aggregate resistance offered by the ice to its descent is about 34 times greater than the force of gravitation. He therefore concluded it to be physically impossible that a glacier could slide down its valley by its own weight, and consequently that the gravitation or fracture and regelation theory could not be maintained. The slow descent of sheet lead on a roof of moderate inclination, and its ability even to draw out from the rafters the nails with which it had been fastened, led him to propound another theory of glacier-motion, viz., that it is due to expansion and contraction caused by changes of solar heat. He contended that the ice, like the lead, is expanded by heat, and that, as it cannot on expansion move up the valley without overcoming the resistance of gravitation as well as of friction, it necessarily moves chiefly downward, in which direction gravitation co-operates. Contraction on the other hand must also tend to send the ice downward, for a larger part will move with the force of gravitation than against it. Dr. Croll, objecting to Canon Moseley's views that no observed alternations of glacier temperature warrant the conclusion that the ice can be impelled downward by that cause, has proposed yet another explanation. He regards the motion of the ice of a glacier as molecular, resulting from the very conduction of heat through the mass of the glacier. He contends that from the thermal conditions of glacier-ice its molecules will melt before their temperature can be raised. Any given molecule on melting will transmit its extra heat or part of it to the next molecule, which in turn may melt, and thus a wave of thaw will travel through the ice. But as each molecule loses its heat again it freezes, and in the act of solidification exerts an enormous pressure on the walls of the interstice into which while fluid it entered. Hence in proportion to the amount of heat received by it the ice is subjected to great molecular pressure. As the glacier cannot expand laterally on account of the walls of its channel, and as gravitation opposes its expansion up the valley, it necessarily finds relief by a downward movement—the direction in which gravitation co-operates.

GLADBACH, usually called BERGISCH-GLADBACH, a town of Prussia, circle of Mülheim, government district of Cologne, is situated 8 miles N. E. of the latter town. It possesses an iron foundry, and manufactories of paper, pasteboard, powder, percussion caps, nets, and machinery. Ironstone, peat, and lime are found in the vicinity. The population in 1905 was 13,411.

GLADBACH, or MÖNCHEN-GLADBACH, a flourishing and rapidly increasing manufacturing town of Rhenish Prussia, capital of a circle in the government district of Düsseldorf, is situated 16 miles W. S. W. of the town of that name. It is one of the chief manufacturing seats of Rhenish Prussia, its principal industries being the spinning and weaving of cotton, the manufacture of silks, velvets, ribbons, and damasks, and dyeing and bleaching. There are also tanneries, tobacco manufactories, machine works and foundries. The town possesses a chamber of commerce, a gymnasium, and a female school of the higher grade There are an Evangelical and three Catholic churches, one of which possesses a choir of 1250, a nave dating from the beginning of the twelfth century, and a crypt of the 8th century. Gladbach existed before the time of Charlemagne, and a Benedictine monastery was founded near it in 972 by Archbishop Gero of Cologne. The population in 1855 was only 4398; but it had increased in 1858 to 13,965, in 1861 to 17,074, in 1871 to 26,354, and in 1905, 60,709.

GLADIATORS, professional combatants with men or beasts in the Roman arena. That this form of spectacle, which is almost peculiar to Rome and the Roman provinces, was originally borrowed from Etruria is shown by various indications. On an Etruscan tomb discovered at Tarquinii there is a representation of gladiatorial games; the slaves employed to carry off the dead bodies from the arena wore masks representing the Etruscan Charon; and we learn from Isidore of Seville that the name for a trainer of gladiators, *lanista*, is an Etruscan word meaning butcher or executioner. These games are evidently a survival of the practice of immolating slaves and prisoners on the tomb of illustrious

chieftains, a practice recorded in Greek, Roman, and Scandinavian legends, and traceable even as late as this century in the Indian suttee. Even at Rome they were for a long time confined to funerals, and hence the older name for gladiators was *bustuarii;* but in the later days of the republic their original significance was forgotten, and they formed as indispensable a part of the public amusements as the theatre or the circus.

The first gladiators are said, on the authority of Valerius Maximus, to have been exhibited at Rome in the Forum Boarium 264 B. C., by Marcus and Decimus Brutus at the funeral of their father. On this occasion only three pairs fought, but the taste for these games spread rapidly, and the number of combatants grew apace. In 174 B. C. Titus Flamininus celebrated his father's obsequies by a three days' fight, in which 74 gladiators took part. Julius Cæsar engaged such extravagant numbers for his ædileship, that his political opponents took fright, and carried a decree of the senate imposing a certain limit of numbers; but notwithstanding this restriction he was able to exhibit no less than 300 couples. During the later days of the republic the gladiators were a constant element of danger to the public peace. The more turbulent spirits among the nobility had each his band of gladiators to act as a body guard, and the armed troops of Clodius, Milo, and Catiline played the same part in Roman history as the armed retainers of the feudal barons or the condottieri of the Italian republics.

Under the empire, notwithstanding sumptuary enactments, the passion for the arena steadily increased. Augustus, indeed, limited the shows to two a year, and forbade a prætor to exhibit more than 120 gladiators, yet allusions in Horace and Persius show that 100 pairs was the fashionable number for private entertainments; and in the Marmor Ancyranum the emperor states that more than 10,000 men had fought during his reign. The imbecile Claudius was devoted to this pastime, and would sit from morning till night in his chair of state, descending now and then to the arena to coax or force the reluctant gladiators to resume their bloody work. Under Nero senators and even well-born women appeared as combatants; and Juvenal has handed down to eternal infamy the descendant of the Gracchi that appeared without disguise as a *retiarius*, and begged his life from the *secutor*, who blushed to conquer one so noble and so vile. Titus, whom his countrymen surnamed the Clement, ordered a show which lasted 100 days; and Trajan, in celebration of his triumph over Decebalus, exhibited 5000 pairs of gladiators. Domitian instituted *venationes* by torchlight, and at the Saturnalia of 90 A. D. arranged a battle between dwarfs and women. Even as late as 200 A. D. an edict was passed forbidding women to fight. How widely the taste for these sanguinary spectacles extended throughout the Roman provinces is attested by monuments, inscriptions, and the remains of vast amphitheatres. From Britain to Syria there was not a town of any size that could not boast its arena and annual games. The following inscription copied from the pedestal of a statue shows the important part they played in provincial life:—"In four days, at Minturnæ, he showed eleven pairs of gladiators, who did not cease fighting till one-half, all the most valiant men in Campania, had fallen. You remember it well, noble fellow citizens." After Italy, Gaul, North Africa, and Spain were most famous for their amphitheatres; and Greece was the only Roman province where the institution never took root.

Gladiators were commonly drawn either from prisoners of war, or slaves, or criminals condemned to death. Thus in the first class we read of tatooed Britons in their war chariots, Thracians with their peculiar bucklers and scimitars, Moors from the villages round Atlas, and negroes from central Africa, exhibited in the Colosseum. Down to the time of the empire only greater malefactors, such as brigands and incendiaries, were condemned to the arena; but by Caligula, Claudius, and Nero this punishment was extended to minor offences, such as fraud and peculation, in order to supply the growing demand for victims. For the first century of the empire it was lawful for masters to sell their slaves as gladiators, but this was forbidden by Hadrian and Marcus Aurelius. Besides these three regular classes, the ranks were recruited by a considerable number of freedmen and Roman citizens who had squandered their estates, and voluntarily took the *auctoramentum gladiatorum*, by which for a stated time they bound themselves to the *lanista*. Even men of birth and fortune not seldom entered the lists, either for the pure love of fighting, or to gratify the whim of some dissolute emperor; and one emperor, Commodus, actually appeared in person in the arena.

Gladiators were trained in schools (*ludi*) owned either by the state or by private citizens; and though the trade of a lanista was considered disgraceful, to own gladiators and let them out for hire was reckoned a legitimate branch of commerce. Thus Cicero, in his letters to Atticus, congratulates his friend on the good bargain he had made in purchasing a band, and urges that he might easily recoup himself by consenting to let them out twice. Men recruited mainly from slaves and criminals, whose lives hung on a thread, must have been more dangerous characters than modern galley slaves or convicts; and, though highly fed and carefully tended, they were of necessity subject to an iron discipline. In the school of gladiators discovered at Pompeii, of the sixty-three skeletons buried in the cells many were in irons. But hard as was the gladiator's lot,—so hard that special precautions had to be taken to prevent suicide,—it had its consolations. A successful gladiator enjoyed far greater fame than any modern prize-fighter or athlete. He was presented with broad pieces, chains, and jewelled helmets, such as may be seen in the museum at Naples; poets like Martial sang his prowess; his portrait was multiplied on vases, lamps, and gems; and high-born ladies contended for his favors. Mixed, too, with the lowest dregs of the city, there must have been many noble barbarians condemned to the vile trade by the hard fate of war. There are few finer characters in Roman history than the Thracian Spartacus, who, escaping with seventy of his comrades from the school of Lentulus at Capua, for three years defied the legions of Rome; and after Antony's defeat at Actium, the only part of his army that remained faithful to his cause were the gladiators whom he had enrolled at Cyzicus to grace his anticipated victory.

There were various classes of gladiators, distinguished by their arms or modes of fighting. The Samnites fought with the national weapons—a large oblong shield, a vizard, a plumed helmet, and a short sword. The Thraces had a small round buckler and a dagger carved like a scythe; they were generally pitted against the Mirmillones, so called from the fish (*μορμύλος*) which served as the crest of their helmet. In like manner the Retiarius was matched with the Secutor; the former had nothing on but a short tunic or apron, and sought to entangle his pursuer, who was fully armed, with the cast-net (*jaculum*) that he carried in his right hand; and if successful, he despatched him with the trident (*tridens, fuscina*) that he carried in his left. We may also mention the Andabatæ, who wore helmets with closed vizors; the Dimachæri of the later empire; the Essedarii, who fought from chariots like the ancient Britons; the Hoplomachi, armed like a Greek hoplite; and the Laqueatores, who tried to lasso their antagonists.

The estimation in which gladiatorial games were held by Roman moralists deserves notice, and the influence that they exercised upon the morals and genius of the nation. The Roman was essentially cruel, not so much from spite or vindictiveness, as from callousness and defective sympathies. This element of inhumanity and brutality must have been deeply ingrained in the national character to have allowed the games to become popular, but there can be no doubt that it was fed and fostered by the savage form which their amusements took. That the sight of bloodshed provokes a love of bloodshed and cruelty is a commonplace of morals. To the horrors of the arena we may attribute in part, not only the brutal treatment of their slaves and prisoners, but the frequency of suicide among the Romans. On the other hand, we should be careful not to exaggerate the effects or draw too sweeping inferences from the prevalence of this degrading amusement. Human nature is happily illogical; and we know that many of the Roman statesmen who gave these games and themselves enjoyed these sights of blood, were in every other department of life irreproachable,—indulgent fathers, humane generals, and mild rulers of provinces. In the present state of society it is difficult to conceive how a man of taste can have endured to gaze upon a scene of human butchery. Yet we should remember that it is less than half a century since bear-baiting was prohibited in England, and we are only now attaining that stage of morality in respect of cruelty to animals that was reached in the 5th century, by the help of Christianity, in respect of cruelty to men. We shall not then be greatly surprised if hardly one of the Roman moralists is found to raise his voice against this amusement, except on the score of extravagance. Cicero, in a well-known passage, commends the gladiatorial games as the best discipline against the fear of death and suffering that can be presented

to the eye. The younger Pliny, who perhaps of all Romans approaches nearest to our ideal of a cultured gentleman, speaks approvingly of them. Marcus Aurelius, though he did much to mitigate their horrors, yet in his writings condemns the monotony rather than the cruelty. Seneca is indeed a splendid exception, and his letter to Lentulus is an eloquent protest against this inhuman sport. But it is without a parallel till we come to the writings of the Christian fathers, Tertullian, Lactantius, Cyprian, and Augustine. In the *Confessions* of the last there occurs a narrative which is worth quoting as a proof of the strange fascination which the games exercised even on a religious man and a Christian. He tell us how his friend Alipius was dragged against his will to the amphitheatre, how he strove to quiet his conscience by closing his eyes, how at some exciting crisis the shonts of the whole assembly aroused his curiosity, how he looked and was lost, grew drunk with the sight of blood, and returned again and again, knowing his guilt yet unable to abstain. The first Christian emperor was persuaded to issue an edict abolishing gladiatorial games (325), yet in 404 we read of an exhibition of gladiators to celebrate the triumph of Honorius over the Goths, and it is said that they were not totally extinct in the West till the time of Theodoric (see GAMES).

Gladiators formed admirable models for the sculptor. One of the finest pieces of ancient sculpture that has come down to us is the Wounded Gladiator of the National Museum at Naples. The so-called Fighting Gladiator of the Borghese collection, now in the Museum of the Louvre, and the Dying Gladiator of the Capitoline Museum, which inspired the famous stanza of *Childe Harold*, have been pronounced by modern antiquaries to represent, not gladiators, but warriors. In this connection we may mention the admirable picture of Gérôme which bears the title, Ave, Cæsar, morituri te salutant.

The attention of archæologists has been recently directed to the *tesseræ* of gladiators. These tesseræ, of which about sixty exist in various museums, are small oblong tablets of ivory or bone, with an inscription on each of the four sides. The first line contains a name in the nominative case, presumably that of the gladiator; the second line a name in the genitive, that of the *patronus* or *dominus;* the third line begins with the letters SP, for *spectatus* or approved, which shows that the gladiator had passed his preliminary trials; this is followed by a day of a Roman month; and in the fourth line are the names of the consuls of a particular year.

GLADIOLUS, a genus of monocotyledonous or endogenous plants, belonging to the natural order *Iridaceæ*, and representative of the tribe *Gladioleæ*, a group of bulbous plants in which the perianth is irregular, and the stamens unilateral and arched, with the filaments free. It belongs to a subdivision of the *Gladioleæ*, in which the segments of the limb of the perianth are very unequal, and is specially distinguished by having the perianth tube curved, funnel-shaped, and widening upwards, and by the segment equalling or exceeding the tube in length. About ninety species are described, of which number upwards of fifty are from the Cape, and the rest from tropical Africa, the central and southern regions of Europe, Persia, the Caucasus, and the Levant. One species, *G. illyricus*, is found apparently wild in England, in the New Forest, Hampshire. Some of the species have been cultivated for a long period in our flower-gardens, where both the introduced species and the modern varieties bred from them are very ornamental and popular. *G. segetum* has been cultivated since 1596, and *G. byzantinus* since 1629, while many additional species were introduced during the latter half of the 18th century. One of the earlier of the hybrids originated in gardens was the beautiful *G Colvillii*, raised in the nursery of Mr. Colvill of Chelsea in 1823 from *G. concolor* fertilized by *G. cardinalis*. In the first decade of the century, however, the Hon. and Rev. W. Herbert had successfully crossed the showy *G. cardinalis* with the smaller but more free-flowering *G. blandus*, and the result was the production of a race of great beauty and fertility. Other crosses were made with *G. tristis*, *G. oppositiflorus*, *G. hirsutus*, *G. alatus*, and *G. natalensis;* but it was not till after the production of *G. gandavensis* about 1843, by the crossing of *G. natalensis* with *G. oppositiflorus* (sometimes erroneously attributed to *natalensis* and *cardinalis*), that the gladiolus may be said to have become a general favorite in gardens. Since that time the varieties have been greatly multiplied in number, and improved in size and quality, as well as marvellously varied in color and marking, so that they have now become exceedingly popular. A few years since large numbers of novel varieties were annually introduced by the French florists, but the English-raised varieties are now in great measure superseding them. One cultivator, Mr. Kelway, of Langport, devotes a space of not less than 8 acres to gladioli, and cultivates annually from 10,000 to 60,000 each of some of the more popular kinds, while seedlings are raised to the extent of half a million a year. The seeds are sown in the open ground about April, glass culture with so large a number being out of the question; and in the first season the young plants make bulbs averaging the size of peas. The time occupied from the sowing of the seed until the plant attains its full strength is from three to four years. The approved sorts, which are identified by name, are multiplied by means of bulblets or offsets which form around the principal bulb or corm; but in this they vary greatly, some kinds furnishing abundant increase and soon becoming plentiful, while others persistently refuse to yield offsets. The stately habit and rich glowing colors of the modern gladioli render them exceedingly valuable as decorative plants during the late summer months. They are, moreover, very desirable and useful flowers for cutting for the purpose of room decoration, for while the blossoms themselves last fresh for some days, the undeveloped buds open in succession, if the stalks are kept in water, so that a cut spike will go on blooming for a considerable period.

GLAMORGAN (Welsh, *Gwlad Morgan*), a maritime county of South Wales, bounded on the N. by Brecknock and Carmarthen, on the W. by Carmarthen and its bay, on the S. by the Bristol Channel, and on the E. by Monmouth, the boundary line of which is the Rhymney. Its greatest length from E. to W. is about 53 miles, its greatest breadth from N. to S. about 29; its coast-line is about 60 miles, and its area 547,070 acres. Population in 1901, 860,022.

Glamorgan, with the exception of some flat tracts on the borders of the Bristol Channel, consists of a succession of hills and valleys, the country inland growing more and more mountainous, after a broad tract of plain on the south coast, until on the borders of Brecknock its surface is a sea of hills. None of the mountains rise to a great height, the most lofty, Mynydd Llangeinor, being but 1859 feet, and the escarpment of Craig y Llyn about the same height or a little higher. Yet their bold forms add grandeur to the scenery of the county, and their lower slopes are clothed with picturesque though not large timber.

The valleys of Glamorgan have been long famous for great beauty of scenery. The vale of Glamorgan, some 8 miles in breadth, has been truly called the "Garden of Wales," and its climate is so mild that myrtles and other tender plants flourish in the open air. The vale of Neath is known to tourists as the waterfall district of South Wales, the finest falls being betwixt Hirwain and Neath, near the Vale of Neath Railway, viz., Cilhepstè fall, the three Clwngwyns, the falls of the Pyrddin, Scwd-Einon Gam, Scwd-Gladys, and Scwd Hen Rhydd on the Llech, with Melincourt and Abergarwedd still nearer Neath. The highest of these falls are above 80 feet. Swansea valley has also fine scenery. Other valleys are those of the Rhymney, the Taff, the Rhondda, and the Llwchwr, the first two giving their names to important railways.

The rivers of Glamorgan are not large. The chief are the Rhymney, forming the county's eastern boundary; the Ogwr or Ogmore, which flows into the Bristol Channel near Porth-Cawl harbor; the Taff, which rises in the Brecon Beacon, flows southward through the county, and forms the important harbor of Cardiff; the Neath and Tawe, flowing south into Swansea Bay; and the Llwchwr, which is the boundary of the county on the west, and, falling into Carmarthen Bay, forms the estuary of the Burry river.

The chief geological feature of Glamorgan is the Coal-measures, which are of the greatest thickness near Neath, but extend nearly over the whole county, and are bounded by a narrow band of Millstone Grit and Mountain Limestone, nearly coincident with the county boundary on the north. In the extreme south and south-west the Devonian, Magnesian Limestone, and the Lias show themselves.

The climate is mild, and the plains on the coast as well as inland are very fertile. The soil is a deep rich loam, improved by lime. Agriculture is as yet not so forward as it might be with such a soil and climate; but the farms are seldom large, and the buildings are not suited to high farming. The crops chiefly raised are wheat, beans, pease, oats,

barley, vetches, turnips, and potatoes. The cattle are of good useful breeds; and good sheep and ponies are reared in the hill-country. According to the agricultural statistics for 1878, the extent under the different crops (the total area being 547,070 acres), and the numbers of live-stock, were as follows:—

| | | |
|---|---|---|
| Corn crops (two-thirds wheat and oats, and nearly one-third barley) | 37,139 | acres. |
| Green crops (two-thirds turnips and swedes) | 15,054 | " |
| Grass under rotation | 26,468 | " |
| Permanent pasture | 186,697 | " |
| Bare, fallow, and uncropped arable land | 33,359 | " |
| Total under crops, bare fallow, and grass | 268,707 | " |

| | |
|---|---|
| Live Stock:—Horses, including ponies | 13,727 |
| Cattle | 46,545 |
| Sheep | 283,389 |
| Pigs | 15,572 |

According to the Owners and Heritages Return 1872–73, the county was divided among 8426 proprietors, holding 428,386 acres, with a gross estimated annual rental of £1,609,379. The estimated amount of commons and waste lands was 47,018 acres. Of the owners, 78·8 per cent. possessed less than one acre, and the average value per acre was £3, 1s. 8¼d. There were 16 proprietors holding 5000 acres and upwards, viz., C. R. M. Talbot, 33,920; Earl of Dunraven, 23,706; Marquis of Bute, 21,402; Lord Windsor, 12,016; Earl of Jersey, 7110; Edward Rees Wingfield, 6463; Lord Tredegar, 6157; Major Vaughan Lee, 6128; Mrs. Blandy Jenkins, 6082; Col. K. Lynte, 5933; Sir Iver B. Guest, 5640; T. Penrice, 5411; Mrs. Chetwode, 5399; R. F. L. Jenner, 5381; C. Bailey, 5343; John D. Llewellyn, 5000.

The industry of Glamorgan is chiefly applied to its coal and iron mines, which practically underlie the whole superficies of the county, and give it its pre-eminence among Welsh counties. In 1872 there were no less than 420 coal pits in Monmouthshire and South Wales, and the yield of some 15 million tons a year came in very large proportion from the Glamorganshire vales of Neath, Taff, Rhondda, Ely, etc. Within the last twenty years the iron works were carried on at an enormous scale of labor and enterprise, there being near Merthyr-Tydvil alone upwards of 60 blast furnaces; but in 1873 it appeared that of 57 furnaces in Glamorganshire 27 were out of blast, and at present (1879) the industry is, from various causes, in a backward state. Excellent means of export for coal and iron are afforded by the unrivalled docks at Cardiff, the enterprise of the late and present marquis of Bute, and by those also at Penarth at the mouth of the Ely. These have within considerably less than a century transformed an insignificant Welsh town into a leading port and emporium with a first rate harbor and anchorage; whilst another dock at Swansea serves a like purpose for the export of the copper ore smelted at Swansea, Neath, Aberavon, and Treforest, and chiefly sold at public ticketings in the first-named town. Cardiff and Swansea, especially the latter, also have a very large export trade in patent compressed fuel prepared from culm and tar.

Glamorgan can boast historic ruins, such as Caerphilly, and Castle Coch near Llandaff, the former a Norman fortress held for Edward II. by the younger De Spencer, the latter an early English fortress on an escarpment of mountain limestone. Other ruined castles are Oystermouth and Pennard in Gower, and Coity near Bridgend; while as restored castles, resided in by their present owners, are Cardiff, the residence of the marquis of Bute, St. Fagan's, near Ely station, and St. Donat's and Dunraven, both on the verge of the Bristol Channel. The county has some fine cromlechs at St. Nicholas and St. Lythan's on the Dyffrin estate, at Cotterell near Peterston, and at Arthur's Stone in Gower. The Sarn Helen, an ancient road, traverses the county. At Llantwit Major, near Cowbridge, was the once famous divinity school founded by St. Germanus, and presided over for an incredible term of years by St. Iltyd. Every stone in this old-world town is "of old memorial." Coity, Coychurch, and Ewenny, near Bridgend, present a fine trio of cross churches, with fortified or embattled towers, characteristic of the county.

South of Swansea lies the promontory of Gower, famed for the beauty of its coast scenery, its people of Flemish descent, planted here by Henry I., and its bone-caves. The last, in the limestone cliffs, accessible only at low water, are at Bacon Hole, Paviland, and Rhosilly Bay.

Besides its ports, Glamorgan has abundant means of transit in four railways and a canal, beside numerous tramways. The county is divided into 128 parishes and 10 hundreds, and is situated in the diocese of Llandaff. The cathedral, 2 miles from the county town of Cardiff, having fallen into decay through the neglect of ages previous to 1844, owed its restoration to a beauty befitting the prestige of the earliest Christian see to the energetic endeavors of Dean Thomas Williams. It was completed in 1869.

The great changes of recent years in elementary education have curiously affected the statistics of schools in Glamorgan. Whereas in 1847 there were 327 day schools in all, with 15,674 scholars, in 1877 the parliamentary return shows a great reduction in the number of schools, though these have probably a much larger aggregate of scholars. This return exhibits 226 public elementary schools in Glamorgan, of which 56 were board-schools, 30 British and foreign, 12 Roman Catholic, 1 Wesleyan, and the remainder national, parochial, and Church of England schools. Of these schools 41 had each in average attendance upwards of 300 scholars, and 2 had upwards of 1000. Fourteen only had night schools in operation. As in other south-west counties, the Welsh language is losing ground, except in remote agricultural districts.

In 1851 the population of the county was 231,849, 120,748 males and 111,101 females; and in 1871 it was 397,859, 205,660 males and 192,199 females. The population has increased since the first census in 1801 by 326,980 persons, or 451 per cent. The county returns two members to parliament, the borough of Merthyr one, and the Cardiff and Swansea districts of boroughs one each, a total of five in all. In the year ending April, 1871, the amount of real property assessed to income and property tax was £1,219,922. The principal towns with the populations in 1871 were—

| | | | |
|---|---|---|---|
| Aberavon[1] | 3,574 | Llantrisaint[2] | 2,039 |
| Aberdare | 36,112 | Lloughor[1] | 1,220 |
| Bridgend | 3,539 | Merthyr Tydvil | 51,949 |
| Cardiff[2] | 30,536 | Neath[1] | 9,319 |
| Cowbridge[2] | 1,134 | Swansea[1] | 51,702 |
| Kenfig[1] | 591 | | |

The bibliography of the county is stronger in such old chronicles as the *Brut y Tywysogion* than in modern researches. Among its important contributions to the *Archæologia Cambrensis* may be mentioned the Rev. H. H. Knight's *Account of Newton Nottage in 1853*; and Dr. Thomas Nicholas's *History of the Annals and Antiquities of Glamorganshire* is the foundation of his *Counties and County Families of Wales*. (J. DA.)

GLANDERS, or EQUINIA, a specific infectious disease to which certain animals, chiefly those possessing an undivided hoof, are liable, and which is communicable from them to man. The term farcy is also employed to designate a variety of this affection, but there is no pathological distinction between the two. The disease as it affects animals belongs to the subject of Veterinary Medicine.

Glanders is happily a rare form of disease in man, there being evidently less affinity for its development in the human subject than in the equine species. It occurs chiefly among those who from their occupation are frequently in contact with horses, such as grooms, coachmen, cavalry soldiers, veterinary surgeons, etc., and seems always produced either by direct inoculation of the virus from a diseased animal into the broken skin, or by the respiration of air containing the poison. It is said to have occasionally been transmitted from man to man, but such an occurrence is extremely rare.

A period of incubation, lasting from three to five days, generally follows the introduction of the virus into the system. This period, however, appears sometimes to be of much longer duration, especially where there has been no direct inoculation of the poison. The first symptoms are a general feeling of illness, accompanied with pains in the limbs and joints resembling those of acute rheumatism. If the disease has been introduced by means of an abraded surface, pain is felt at that point, and inflammatory swelling takes place there, and extends along the neighboring lymphatics. An ulcer is formed at the point of inoculation which discharges an offensive ichor, and blebs appear in the inflamed skin, along with diffuse abscesses, as in phlegmonous erysipelas. Sometimes the disease stops short with these local manifestations, but more commonly goes on rapidly accompanied with symptoms of grave constitutional disturb

[1] Contributory to Swansea parliamentary district of boroughs
[2] Contributory to Cardiff parliamentary district of boroughs.

ance. Over the whole surface of the body there appear numerous red spots or pustules, which break and discharge a thick mucous or sanguineous fluid. Besides these there are larger swellings lying deeper in the subcutaneous tissue, which at first are extremely hard and painful, and to which the term farcy "buds" or "buttons" is applied. These ultimately open and become extensive sloughing ulcers.

The mucous membranes participate in the same lesions as are present in the skin, and this is particularly the case with the interior of the nose, where indeed, in many instances, the disease first of all shows itself. This organ becomes greatly swollen and inflamed, while from one or both nostrils there exudes a copious discharge of highly offensive purulent or sanguineous matter. The lining membrane of the nostrils is covered with papules similar in character to those on the skin, which form ulcers, and may lead to the destruction of the cartilaginous and bony textures of the nose. The diseased action extends into the throat, mouth, and eyes, while the whole face becomes swollen and erysipelatous, and the lymphatic glands under the jaws inflame and suppurate. Not unfrequently the bronchial tubes become affected, and cough attended with expectoration of matter similar to that discharged from the nose is the consequence. The general constitutional symptoms are exceedingly severe, and advance with great rapidity, the patient passing into a state of extreme prostration. In the acute form of the disease recovery rarely if ever occurs, and the case generally terminates fatally in a period varying from two or three days to as many weeks.

A chronic form of glanders and farcy is occasionally met with, in which the symptoms, although essentially the same as those above described, advance much more slowly, and are attended with relatively less urgent constitutional disturbance. Cases of recovery from this form are on record; but in general the disease ultimately proves fatal by exhaustion of the patient, or by a sudden supervention, which is apt to occur, of the acute form. On the other hand, acute glanders is never observed to become chronic.

In the treatment of this malady the main reliance is to be placed on the maintenance of the patient's strength by strong nourishment and tonic remedies. If the point of inoculation of the virus can be early made out, its active cauterization, as in the case of any poisoned wound, should be resorted to. The opening of abscesses antiseptically, as well as the use of antiseptic lotions for the affected mucous membranes, is recommended. In all cases of the outbreak of glanders it is of the utmost consequence to prevent the spread of the disease by the destruction of affected animals, and the cleansing and disinfection of infected localities.

GLANVIL, Glanvill, or Glanville, Ranulph de (died 1190), the oldest writer on English jurisprudence and chief justiciary of England in the reign of Henry II., was born at Stratford in Suffolk, but in what year is unknown. There is also almost no information regarding his early life. Butterley Abbey was founded by him in 1171. In 1174, along with other barons of Yorkshire, he raised a body of knights to oppose William the Lion, king of Scotland, who had invaded the north of England, and it was he who took the king prisoner at Alnwick. In 1175 he was appointed sheriff of Yorkshire, in 1176 justice of the king's court and a justice itinerant in the northern circuit, and in 1180 chief justiciary of all England. It was under his direction that Henry II. completed his judicial reforms, but the principal of them had been carried out before he came into office. After the death of Henry in 1189 Glanvil was removed from his office by Richard I., and imprisoned till he had paid a ransom, according to one authority, of £15,000. Shortly after obtaining his freedom he joined the order of the cross, and he died at the siege of Acre in 1190. At the instance, it is supposed, of Henry II., Glanvil wrote or superintended the writing of the *Tractatus de legibus et consuetudinibus regni Angliæ*, which is divided into 14 books, and is chiefly a practical treatise on the forms of procedure in the *curia regis* or king's court, the principles of law involved in these forms being only incidentally referred to. As the source of our knowledge regarding the earliest form of the *curia regis*, and for the information it affords regarding ancient customs and laws, it is of great value to the student of English history. It is now generally agreed that the work of Glanvil is of earlier date than the *Regiam Majestatem*, a work which bears a close resemblance to his. To him is also ascribed the recension of English laws made in the reign of Henry II.

The treatise of Glanvil was first printed in 1554. An English translation, with notes and introduction by John Beames, was published at London in 1812. A MS. copy of a Norman-French translation, made apparently in the reign of King John, is contained in the library of the duke of Northumberland at Alnwick Castle.

GLANVILL, or Glanvil, Joseph (1636–1680), was born at Plymouth in 1636, and was educated at Oxford university, where he graduated as M.A. in 1658. In 1666 he obtained the cure of Abbey Church at Bath; in 1678 he became prebendary of the church of Worcester, and acted as chaplain in ordinary to Charles II. He died at Bath, November 16, 1680, in the forty-fourth year of his age. Glanvill's first work, *The Vanity of Dogmatizing, or Confidence in Opinions, manifested in a Discourse of the shortness and uncertainty of our Knowledge, and its Causes, with Reflections on Peripateticism, and an Apology for Philosophy*, 1661, is interesting as showing one special direction in which the new method of the Cartesian philosophy might be developed. Pascal had already shown how philosophical scepticism might be employed as a bulwark for faith, and Glanvill follows in the same track. The philosophic endeavor to cognize the whole system of things by referring all events to their causes appears to him to be from the outset doomed to failure. For if we inquire into this causal relation we find that though we know isolated facts, we cannot perceive any such connection between them as that the one should give rise to the other. In the words of Hume, "they seem conjoined but never connected." All causes then are but secondary, are merely the occasions on which the one first cause operates. It is singular enough that Glanvill, who had not only shown, but even exaggerated, the infirmity of human reason, himself paid a strange tribute to its weakness; for, after having combated scientific dogmatism, he not only yielded to vulgar superstitions, but actually endeavored to accredit them both in his *Scepsis Scientifica*, 1665, and in his *Philosophical Considerations concerning the existence of Sorcerers and Sorcery*, published in 1666, in 4to. The story of the pretended drum, which was said to have been heard every night in the house of an inhabitant of Wiltshire (Mr. Mompesson), a story which made much noise in the year 1663, and which is supposed to have furnished Addison with the idea of his comedy of the *Drummer*, appears to have given occasion to the latter work. At his death Glanvill left a piece entitled *Sadducismus Triumphatus*, which was printed in 1681, reprinted with some additions in 1682, and translated into German in 1701. He had there collected twenty-six relations or stories of the same description as that of the drum, in order to establish, by a series of facts, the opinion which he had expressed in his *Philosophical Considerations*. Glanvill supported a much more honorable cause when he undertook the defence of the Royal Society of London, under the title of *Plus Ultra, or the Progress and Advancement of Science since the time of Aristotle*, 1658, a work which shows how thoroughly he was imbued with the ideas of the empirical method as in Bacon. The style of Glanvill is clear, easy, and animated; and to the student of philosophy his words are of considerable interest.

Besides the works already noticed, Glanvill wrote *Lux Orientalis*, 1662; *Philosophia Pia, or Discourse on the Religious Character, and the Tendency of Experimental Philosophy; Essays on Several Important Subjects in Philosophy and Religion*, 1676; *An Essay concerning Preaching*; and *Sermons*. After his death in 1681, there were published other sermons, etc., in one volume, 4to. See Rémusat, *Hist. de la Phil. en Angleterre*, bk. iii. ch. xi.

GLARUS, or Glaris, a canton of Switzerland, is bounded on the N. and N. E. by St. Gall, on the E. and S. by the Grisons, and on the W. by Uri and Schwyz. Its area is 266 or 267 square miles, its greatest length about 33 miles, and its greatest breadth about 16. A thoroughly Alpine district, sloping northwards from the lofty range which comprises the Tödi (11,887 feet), the Biferten Stock (11,237), and the Scheibe (9587), and including within its limits the Glärnisch (9584) and the Mürtschen Stock (8012), Glarus is almost completely cut off from the neighboring cantons, except towards the south. Of the three passes, the Segnes, the Kisten, and the Panix, which communicate with the Grisons, the first and second are over the snow, and the third has only a bridle-path; and the Klausen pass and the Pragel pass, which conduct respectively to Schwyz and Uri, have also mere bridle-paths. As far as it is a habitable coun-

try it may be said to consist of the valley of the Linth, which extends from the Tödi southward to the Wallenstadt Lake along with the lesser valleys of the Sernf (or Sernft) and the Klön, which branch off to the east and the west. The climate, it need hardly be said, is a severe one, the snow generally remaining, even in the lowlands, till near the beginning of May. The föhn at times blows with terrific violence; and, by a law enforced in the town of Glarus, every fire in the place must be extinguished as soon as it sets in. The chief sources of wealth in the canton are the pastures and the manufacturing industries. Though copper, silver, and iron mines were formerly wrought, the only mineral production now of commercial importance is slate, which is extensively quarried in the Plattenberg. Not more than a fifth of the soil is capable of cultivation by the plough, and the agricultural produce has consequently to be supplemented by foreign supplies. About 9000 or 10,000 head of cattle are pastured in the canton, and according to the census of 1876 there are 2000 sheep, 6900 goats, and 3000 swine. Neither butter nor ordinary cheese is made in sufficient quantities for the local consumption, but the *Schabzeiger*, *Schotter Käse*, *Kräuterkäse*, or "green cheese," made of skim milk, whether of goats or cows, mixed with buttermilk and colored with powdered *steinklee* (*Melilotus cærulea*), is still largely manufactured. The curd is brought down from the mountain chalets in sacks, which contain about 200 lb each. After being ground for about 2½ hours in a mill along with the *klee* powder, which is added in the proportion of 3 lb to the 100, the curd is put into shapes, and pressed in the usual way. It grows ripe in about a year and keeps a long time. Large quantities are exported to America. The cotton manufacture is the staple of the canton, and gives support to about a fourth of the population. Formerly distributed through the country as a domestic industry, it is now concentrated in a few factory towns and villages, which in the aggregate keep about 250,000 spindles going. The cotton goods are sent to the East, America, and Africa. It is not only in their own little country that the people of Glarus find a field for their energies; they have contributed to the industries of many parts of Europe, and their poorer emigrants have founded three flourishing settlements in Wisconsin—New Glarus, Vilten, and New Elm. The population, which in 1851 was 30,213, had increased by 1870 to 35,150, and was estimated in 1900 at 32,297. The vast majority are Protestants, only 8000 being Catholics, according to the census of 1900. The constitution of Glarus is of the simplest kind, and extremely democratic. According to the law of 1842, revised and sanctioned by the federal council in 1851, the government rests in the hands of a Landesgemeinde or assembly of the whole male population above the age of eighteen, which usually meets on the first Sunday in May, and elects the cantonal officials, votes the income and poll-taxes, and passes or rejects any laws that may be presented by the cantonal council or Landesrath. The cantonal council consists of 117 members. A council of 45 members, and a committee of 9 members have control of the executive. The landamman is president of the committee, the executive council, the cantonal council, and the assembly. Justice is administered by five courts completely independent of the Government. Freedom of the press, freedom of religious worship, and freedom of trade and industry are all guaranteed. Aliens are readily naturalized and admitted to the rights of citizens. The canton is divided into 25 communes, only one of which, that of Glarus, has more than 5000 inhabitants, while 16 have less than 1000, and the smallest has only 231.

GLARUS, the capital of the canton, is a flourishing little town on the left bank of the Linth, about 1495 feet above the sea-level. Its environment is a remarkable one: to the S. the Glärnisch rises 6153 feet; to the N. W. the Wiggis, 6033 feet; and to the E. the Schild, 6010. The fire of 1861 devastated the greater part of the town, destroying its Gothic church of the 10th century, the casino, the Government houses, and all its principal buildings; 2000 of the inhabitants were rendered houseless, and property to the value of 8,000,000 francs was destroyed. Contributions, however, were sent in from far and near to the amount of 2,754,606 francs, the federal authorities of Switzerland voted a loan of 1,000,000 at two per cent., and the canton furnished a subsidy at three per cent.; the town was rapidly rebuilt in a substantial and regular style, and the public edifices restored. The church is used in common by the Protestants and the Roman Catholics. The high school accommodates 700 pupils. Most of the population, which in 1900 numbered 4896, are supported by the cotton manufacture carried on in the town and the vicinity. A certain trace of rustic life is still maintained, as the operatives have each a bit of ground in the "almend." On the opposite side of the river lies the industrial village of Enneda.

In the end of the 5th century an Irish monk, Fridolin, the founder of the convent of Seckingen on the Rhine, built a church on the site of the present town, and the name of St. Hilarius, which he gave it in honor of his patron the bishop of Poitiers, in course of time became corrupted to Glarus or Glaris. The whole valley was reckoned to the estates of the abbey of Seckingen, and it was governed by a mayor or bailiff whose nomination was vested ultimately in the Hapsburg family. The tyranny of these officers constrained the people of Glarus to join the Helvetic confederation in 1352, and in 1388 they secured their independence by a victory over the Austrians at Näfels, the anniversary of which is still celebrated on the second Thursday of April. Zwingli the Reformer was curate of Glarus from 1506 to 1516, and by 1530 the new doctrines had been accepted by five-sixths of the population of the canton. The two religious parties, though they were happily prevented from appealing to arms, continued long in a state of mutual alienation and suspicion; the Protestants, for example, would have nothing to do with the Gregorian calendar because it was introduced by the papal party. At length a settlement of a peculiar kind was effected in 1683. Each confession was allowed to have a cantonal assembly, a cantonal council, and officials of its own; while for all matters in which both parties were interested there was a cantonal assembly and a cantonal council for discussion and administration in common. It was in the beginning of the 18th century that the present prosperity of the canton received its original impulse. Cotton-spinning was introduced in 1712 by Heidegger of Zurich, and weaving and calico-printing followed before 1750. The population of the canton increased from 15,000 to 20,000 during the century. The effects of the great Revolution were beneficially experienced, and the early part of the 19th century was marked by numerous improvements, political and social. Till 1811 the lower course of the Linth was extremely irregular, and its inundations had gradually turned a large stretch of country into a swamp; but, under the patronage and direction mainly of Escher (von der Linth, as he came afterwards to be called), there was constructed a magnificent system of canals which completely remedied the evils, and the desolate region soon became one of the finest parts of the canton. The whole cost of the works up till 1823 was 974,553 francs. When the new constitution of 1836 was introduced, the Roman Catholic minority, whose influence it greatly diminished, were urged on by Bossi, the bishop of Chur (Coire), to break off from their Protestant countrymen; but the Government expelled the few priests who refused to take the oath, and separated the canton from its connection with the diocese of Chur. After Bossi's death the decree of separation was revoked. In the Sonderbund war of 1847 Glarus was true to the federation; and the same spirit was shown in the voting about the constitution in 1872–5.

GLAS, JOHN (1695–1773), the founder of the sect generally known as Glassites or Sandemanians, was born at Auchtermuchty, Fife, where his father was parish minister, on the 5th of October, 1695. On completion of his education for the ministry at the universities of St. Andrews and Edinburgh, he was licensed as a preacher by the presbytery of Perth, and soon afterwards ordained by that of Dundee as minister of the parish of Tealing (1719). During his ministry there he gradually formed peculiar opinions, which as early as 1725 found expression in the formation of a society "separate from the multitude," numbering nearly a hundred, and drawn from his own and neighboring parishes. The members of this *ecclesiola in ecclesia* pledged themselves "to join together in the Christian profession, to follow Christ the Lord as the righteousness of his people, to walk together in brotherly love, and in the duties of it in subjection to Mr. Glas as their overseer in the Lord, to

observe the ordinance of the Lord's Supper once every month, to submit themselves to the Lord's law for removing offences" (Matth. xviii.), and so on. From the scriptural doctrine of the essentially spiritual and heavenly nature of the kingdom of Christ, Glas in his public teaching drew the conclusions, not only that the church, as being identical with that kingdom, ought to consist of none but truly spiritual Christian men, but also that the civil establishment of the church was unlawful and utterly inconsistent with the spirit of Christianity.[1] For the promulgation of these views, which were confessedly at variance with the doctrines of the standards of the national Church of Scotland, he was summoned (1726) before his presbytery, where, in the course of the investigations which followed, he affirmed with still more explicitness than formerly his belief that "every national church established by the laws of earthly kingdoms is antichristian in its constitution and persecuting in its spirit," and further declared opinions upon the subject of church government which amounted to an entire repudiation of Presbyterianism and an acceptance of Independency. For these opinions he was in 1728 suspended from the discharge of ministerial functions, and finally in 1730 deposed; the members of the society already referred to, however, for the most part continued to adhere to him, thus constituting the first "Glassite" or "Glasite" church. The seat of this congregation was shortly afterwards transferred to Dundee, whence Glas subsequently removed to Edinburgh, where he officiated for some time as an "elder." He next labored in Perth for a few years, but ultimately returned to Dundee, where the remainder of his life was spent. In 1739 the General Assembly, without any application either from him or from his friends, removed the sentence of deposition which had been passed against him, and restored him to the character and exercise of a minister of the gospel of Christ, though declaring that he was not to be esteemed a minister of the Established Church of Scotland, or eligible for a charge, until he should have renounced the principles embraced and avowed by him that were inconsistent with the constitution of the church. Besides the *Testimony* Glas wrote a number of papers, expository, polemical, or practical, which were published in a collected edition at Edinburgh in 1761 (4 vols. 8vo), and again at Perth in 1782 (5 vols. 8vo). He died in 1773.

The Glassite denomination, which has never been a numerous one, is distinguished by a number of peculiarities alike in doctrine, discipline, and worship, some of which have already been indicated. One of the most characteristic of its tenets is that which owes its elaboration to Robert Sandeman (1718–1771), the son-in-law of Glas, from whom is derived the name of Sandemanians, by which the sect is principally known in England and America. In a series of letters (1757) to Hervey, the author of *Theron and Aspasio*, he maintained that justifying faith is a simple assent to the divine testimony concerning Jesus Christ, differing in no way in its character from belief in any ordinary human testimony. No distinctive theological system, however, has as yet been elaborated from this point of view. In their practice the Glassite churches aim at a strict conformity with the primitive type of Christianity as that is understood by them. Each congregation has a plurality of elders, pastors, or bishops, who are chosen according to what are believed to be the instructions of Paul, without regard to previous education or present occupation, and who enjoy a perfect equality in office. To have been married a second time disqualifies for ordination, or for continued tenure of the office of bishop. In all the action of the church unanimity is considered to be necessary; and if any member differ in opinion from the rest, he must either surrender his judgment to that of the church or be shut out from its communion. To join in prayer with any one who is not a member of the denomination is regarded as unlawful, and even to eat or drink with one who has been excommunicated is held to be a heinous sin. The Lord's Supper is observed weekly; and between forenoon and afternoon service every Sunday a love feast, at which it is incumbent on every member to be present, is held after the manner of the primitive Christians. Mutual exhortation is practised at all the meetings for divine service, it being lawful for any member who possesses the gift to speak. The practice of washing one another's feet was at one time observed; and it is still customary for each brother and sister to receive new members, on admission, with a holy kiss. "Things strangled" and "blood" are rigorously abstained from; the lot is regarded as sacred; the accumulation of wealth is regarded as unscriptural and improper, and each member considers his property as liable to be called for at any time to meet the wants of the poor and the necessities of the church. The number of adherents at present belonging to the denomination is probably a little under 2000.

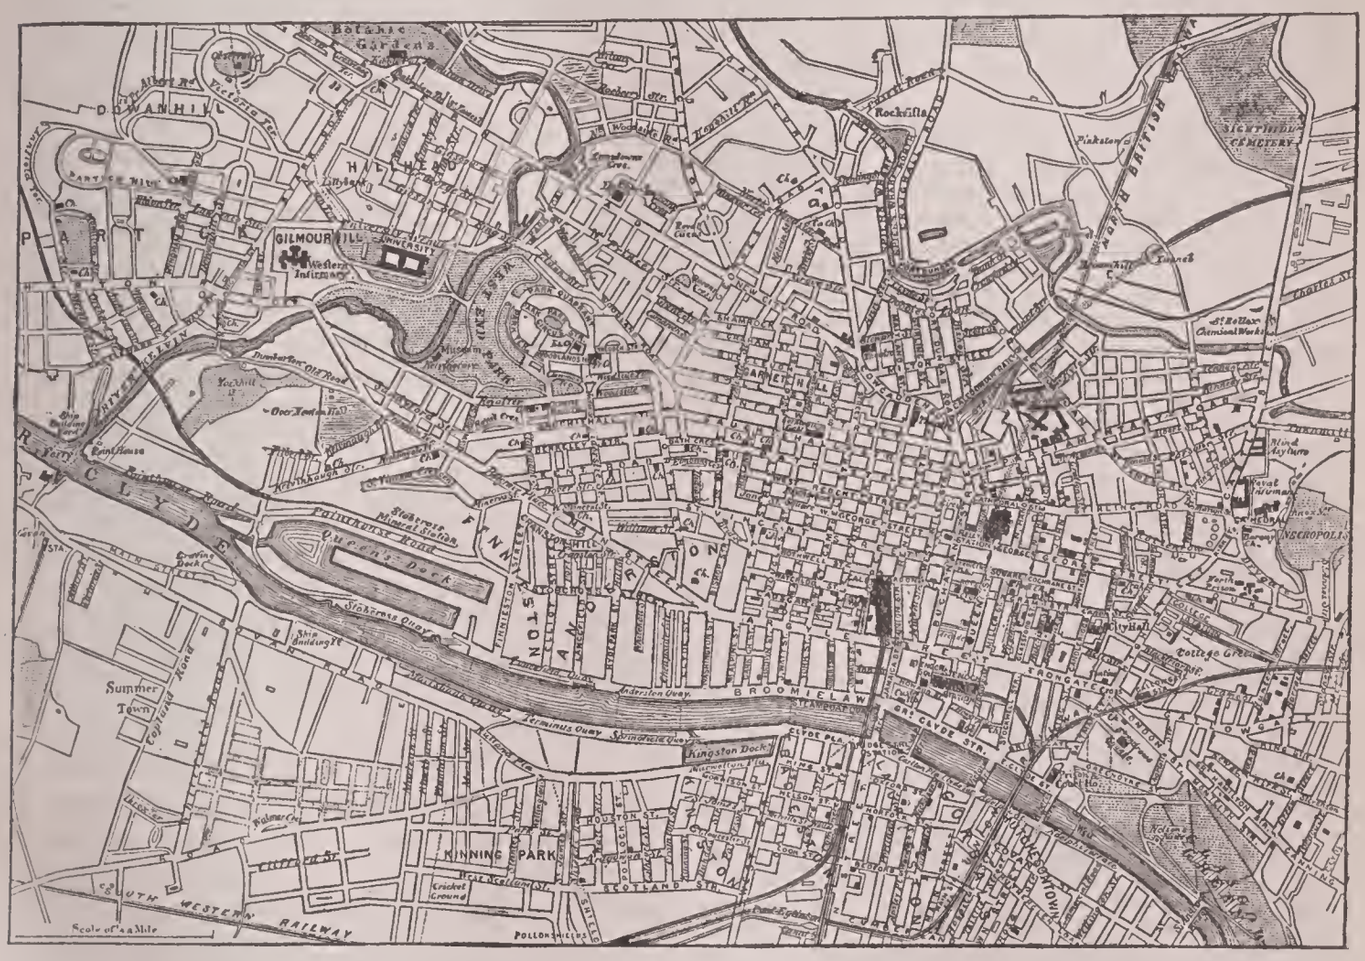
[1] His argument is most fully exhibited in a treatise entitled *The Testimony of the King of Martyrs concerning His Kingdom* (John xviii. 36 37) *Explained and Illustrated* (1729).

GLASER, CHRISTOPHER, one of the minor chemists of the 17th century, concerning the details of whose life very little is known. He was a native of Basel, came to Paris, succeeded Lefebvre as demonstrator on chemistry in the Jardin du Roi, and was appointed apothecary to Louis XIV. and to the duke of Orleans. He is best known to us by his *Traité de la Chymie* (Paris, 1663), which gives a very favorable idea of the chemical science of his time. The little work went through some ten editions in about five-and-twenty years, and was translated into both German and English. Dumas and other writers, indeed, have spoken very disparagingly both of the *Traité* and of the author's merits and character, but this adverse judgment appears to rest on altogether insufficient grounds. One thing very much against Glaser is his alleged connection with the marchioness de Brinvilliers. It does not appear, however, that he had any share in the notorious poisonings beyond making the deadly substances which the marchioness and others employed in secret. He appears to have died some years before 1676. A salt (the normal sulphate of potassium) which he showed how to prepare, and the medicinal properties of which he pointed out, was named *Glaseri sal polychrestum*, or salt of many uses. The native sulphate is still known as *glaserite*.

GLASGOW, the most populous city in Great Britain next to London, is situated on the banks of the river Clyde, in the Scottish county of Lanarkshire, about 20 miles above Greenock, where the river spreads out into a noble estuary, with branching lochs running deep into the heart of the Western Highlands. It is within ten hours' railway run (405½ miles) of the metropolis, and an hour and a quarter (45 miles) of Edinburgh—the latitude being 55° 51′ 32″ N., and the longitude 4° 17′ 54″ W. The extreme breadth of the city is about 3¼ miles from north to south, and the extreme length 5 miles from east to west. The circumference is about 10 miles; and the area embraced within the municipal boundaries is now (1879) 6111½ acres. The population when the last census was taken in 1871 was 477,732, but, during the eight years that have elapsed, the increase of inhabitants both in the city proper and in its suburbs has been very great. It is within the mark to say that above 100,000 have been added to the population of the city; this indeed is the estimate given in official registration returns, which set down the population estimated to the middle of 1879 as 578,156. The smaller burghs which have sprung up round Glasgow within the last twenty or thirty years have kept pace with the mother burgh in development, and now contain a population amongst them of about 170,000. As these burghs are essentially parts of Glasgow, having been formed by the overflow of its population, they ought to be added to the city in any estimate of its size and importance. The population of Glasgow, taking this basis, is therefore close upon three-quarters of a million (750,000). The increase of the population during the present century has been greater perhaps than that of any other city or town of the Old World. In 1801 it was only 77,385; in 1821 it was 147,043; in 1841, 255,650; in 1861, 395,503; and in 1871, 477,732. In 1901 the population was 571,569 for the town and 662,355 for the parliamentary borough.

Unlike the "grey metropolis of the north," Glasgow shows rather poorly in the history of Scotland. Its own real history—the history of its commerce and industries—can hardly be dated farther back than the beginning of the last century, when the union of England and Scotland roused into extraordinary activity the trading spirit of its inhabitants. And yet Glasgow is an old city. Its foundations were laid when the half-mythical Kentigern sat down by the banks of the Molendinar, to teach the rough Celts of Strathclyde the truths of Christianity. It was about the middle of the 6th century that this apostle of truth made his appearance in the west of Scotland, and built his little wooden church on the spot upon which some centuries later his successors reared the noble cathedral which still stands in perfect beauty. One can only guess that the inhabitants of this portion of Strathclyde gathered round the abode and church of St. Mungo, and that as the site was pleasant, and the Molendinar and the Clyde supplied ample store of trout and salmon, the village under the fostering care of the

monks grew slowly till it became a place of importance. Of that growth, however, nothing is really known till we reach the 12th century. In the year 1115 an investigation was ordered by David, then prince of Cumbria, of the lands and churches belonging to the bishopric of Glasgow, and from the deed which still exists it is evident that at that time a cathedral had been endowed. A few years later David succeeded to the Scottish throne on the death of his brother, Alexander I., and among the many endowments he made for religious purposes, we find that he gave to the see of Glasgow the lands of Partick, besides restoring many possessions of which it had been despoiled. Jocelyn was bishop of Glasgow for a long period, and is memorable for the efforts he made to rebuild the cathedral which had been destroyed by fire. He collected funds with so much success that in 1197 the new structure was sufficiently advanced to be dedicated. The next bishops of note were Bodington and Wisheart. The former carried on the building work of Jocelyn; the latter was a patriotic Scot who resisted the conquering army of Edward I., and was among the first to join in the revolt of Wallace, and to receive Robert Bruce when he was proscribed by Edward and lay under the ban of the church for the murder of the Red Comyn. Wisheart was a prisoner from the year 1306 to the battle of Bannockburn, and he lived to see Bruce firmly established upon the Scottish throne. Bishop Rae deserves mention for having built a stone bridge over the Clyde (1345). Bishop Turnbull was the greatest benefactor the city had till then found; for he was the founder of Glasgow university (1450). He also received a charter from James II. in 1420, erecting the town and the lands of the bishops into a regality. In 1491 the see was made metropolitan through the influence of James IV., who had been a canon of the cathedral in early life. The last Roman Catholic archbishop of Glasgow was James Bethune, consecrated in 1552. At the Reformation in 1560 the archbishop fled to France, carrying with him all the relics, documents, and valuables belonging to the see. The cathedral, upon which so much care had been bestowed by the successors of Bishop Jocelyn, very nearly suffered the devastation which was inflicted upon so many abbeys and churches by the more bigoted of the Reformers. It was saved by the craftsmen of Glasgow turning out in



Plan of Glasgow (central portion).

their strength and chasing away the destroyers of the "rookeries," who had already begun to lay sacrilegious hands upon the venerable building. After the Reformation, and till the Revolution of 1688, which re-established Presbyterianism as the religious form of worship in Scotland, the see of Glasgow was occupied by a number of archbishops, the tenure of whose office in many cases was precarious. The most notable fact after the Reformation in the history of the Glasgow Church was the Assembly of 1638 which was held in the city, when Episcopacy was energetically abjured, the Solemn League and Covenant accepted, and its signature made binding upon all who claimed the ordinances of the Presbyterian Church. The fact that the craftsmen were zealous for the preservation of their fine old cathedral indicates probably that the Reformation doctrines were not received so enthusiastically in Glasgow as in many other places in Scotland; but they took deep root latterly, and in the struggles for religious and civil liberty in the 17th century the inhabitants were among the foremost to assist and endure in the good cause.

Glasgow owed its erection into a burgh to its ecclesiastic lords. One of these obtained a royal charter from William the Lion in the last quarter of the 12th century (between the years 1175 and 1178), which made the town a burgh, and gave it a market with freedom and customs. Another charter, it is supposed, was granted in 1190, and according to a deed dated 1268 the town was governed by a provost and bailies, and had courts of justice for settling disputes among the inhabitants. There are no records, however, till almost quite recent times. A few incidents of national history with which Glasgow was connected may be noted, to fill up the blank from the period when it was an ecclesiastical town to the date at which it started its great career as the capital of Scottish industry and commerce. Wallace fought one of his successful battles for Scottish liberty in the High Street of Glasgow in the year 1300. In 1350 the plague raged in the city, and returned thirty years afterwards, though not in so severe a form. About 1542 the bishop's castle, which was garrisoned by the earl of Lennox, was besieged by the earl of Angus, then regent, and after its surrender on terms which were dishonored, a skirmish took place between the parties at the Butts to the east of

the town. The regent's troops were successful, and to punish the inhabitants for their devotion to the Lennox family the town was pillaged. The unfortunate Queen Mary visited her husband Darnley when he lay ill at his father's house Limmerfield, near Glasgow—a visit which afterwards was made of fatal significance to her when her case was heard before Queen Elizabeth in council. The inhabitants of Glasgow had no liking for the fair queen, for many of them fought against her at the battle of Langside, where she lost her crown and kingdom. Glasgow seems to have been fairly prosperous after the accession of James VI. and the union of the crowns of England and Scotland. It was recovering from the loss which it sustained by the Reformation through the dispersion of the wealth of its ecclesiastical lords. A little trade was springing up with foreign parts, chiefly with the Low Countries. But the city suffered somewhat severely in the reign of Charles I. Its inhabitants had become fiercely anti-prelatical, and were obnoxious to the ruling powers. When Montrose in his victorious course marched into the city after the battle of Kilsyth he levied a heavy contribution, although the city was suffering at the time from one of the periodical visits of the plague. In 1648 the provost and his bailies were deposed for contumacy to Charles I., and were imprisoned for a few days, while four regiments of foot and horse were quartered on the magistrates, council, and session. Plague and famine prevailed during the following year; in 1652 there was a great fire which destroyed about a third of the town and £100,000 worth of property. After the restoration of Charles II., and during the persecutions of his and his brother's reign, Glasgow suffered severely. It was a centre of disaffection against the Government, the headquarters of the Whigs of the west of Scotland. Glasgow prison was filled to overflowing with the rebels, as they were called, and it is a proof of the sympathy with which they were regarded by the citizens that on the occasion of another great fire in 1678 the doors of the prison were thrown open, and the prisoners set at liberty. The Government retaliated by sending an army of wild Highlanders to the city, who savagely oppressed the inhabitants and roused up the spirit of resistance which vented itself at London Hill and Bothwell Bridge. With the Revolution peace and prosperity came to Glasgow, only to be partially interrupted by the risings in 1715 and 1745. A regiment of 500 men was raised in Glasgow to support William and Mary and Presbyterian rights and privileges; and in return the city was declared free by a charter, the citizens having the right of electing their own municipal rulers.

Glasgow was not aware of the vast benefits that were conferred upon her by the union of England and Scotland in 1707. The measure was stoutly resisted by the inhabitants, and its proclamation nearly led to a riot; but the merchants very soon saw that by the water highway which flowed through the town they could have access to the profitable trade that had been opened up in North America. Glasgow's situation for the western foreign traffic was the best in Scotland, and inferior to none of the great towns of England. The Treaty of Union put every Scottish port, so far as trade was concerned, on an equal footing with the English ports; and there was no reason why Glasgow should not share in the wealth which in ever-increasing amount was yearly coming across the Atlantic. As has been already stated, after the troublous times of the Reformation the trade prosperity of Glasgow was considerable. In the middle of the 16th century there were ten towns in Scotland above it in population and importance, but by the close of the 17th century it had risen to the second rank, with a population of about 10,000 or 11,000. This increase is to be ascribed to the monopoly which the inhabitants had secured in the middle of the 17th century of the sale of raw and refined sugars for the most of Scotland. Besides this they had the right of distilling spirits from molasses free of duty; they conducted a considerable trade in cured herrings and salmon, were manufacturers of soap, and sent to the English ports hides and linen, bringing back in exchange tobacco and manufactured goods, which they distributed north of the Tweed. Bristol was then the great emporium of tobacco, and Glasgow's commercial connections with it naturally turned the attention of its traders to that lucrative branch of commerce. When it became possible for Glasgow merchants to enter into competition with the merchants of Bristol, companies were formed to carry on the trade with the North American colonies, and a large trade was soon established. Ships were chartered, and as wealth poured in were built, and sailed regularly for Virginia, Maryland, and Carolina, taking out goods in barter for cargoes of tobacco. In 1760 Glasgow had completely rivalled Bristol in the tobacco trade, and in 1772 its importations were more than half of the entire quantity brought into the United Kingdom. The Virginian trade being exceedingly lucrative, Glasgow flourished under it. The town rapidly extended westward, handsome mansion-houses for the "tobacco lords" were erected, and the austerity of manners which had come down from the covenanting days was somewhat relaxed. The money made by tobacco found its way into other branches of commerce and stimulated new industries. The tobacco trade, however, received a crushing blow at the outbreak of the American War,—a blow from which it never wholly recovered, for after the war was over, and the thirteen colonies had become the United States of North America, Glasgow was engaged in other commercial enterprises. The distress in the city was keen during the first years of the war, and Glasgow capitalists turned their attention to the West Indies and the cultivation of the sugar cane. The manufacture of cotton goods was introduced also about this time, and proved a new source of wealth and prosperity. Calico printing, which was soon to develop into a great industry employing thousands of persons, was started at Pollokshaws in 1742; the inkle loom was set up in 1732; glass-making was established in a feeble way in 1730; and the brewing of beer and ale on a large scale was attempted with success. In 1764 James Watt perfected his first model of a steam engine in a small workshop, which had been granted to him by the senatus of the university, within the college walls. From the Treaty of Union down to the end of the 18th century, the progress of the city had been remarkable. In 1708 the population was estimated to be upwards of 12,000; at the end of the century it was close upon 80,000.

*The Harbor.*—The energies of the traders of Glasgow were naturally somewhat confined by having a port so far away as Port-Glasgow, and there is little wonder that, when their commerce began to extend, they should have cast about for plans to deepen the water-way and enable them to bring their merchandise to their own warehouses in the city. The task which lay before them was one involving numerous difficulties. "A hundred years ago," says Mr. Deas, the engineer of the Clyde trust, in his interesting sketch of *The Rise and Progress of the Harbor of Glasgow*, "the river was almost in a state of nature, and was fordable on foot at Dumbuck Ford, more than 12 miles below Glasgow." As early as 1566 the authorities of the towns of Glasgow, Renfrew, and Dumbarton endeavored to remove a sandbank, a little above the latter town, and though operations were intermittingly carried on for some years, they do not appear to have been very successful. Prior to 1658 the shipping port of Glasgow was Irvine in Ayrshire, but the passage of lighters from that place was tedious and the land carriage expensive. It was determined in 1658 by the magistrates of Glasgow to purchase ground at Dumbarton, and construct a spacious harbor there. The magistrates of that royal burgh, however, objected, on the plea that "the great influx of mariners and others would raise the price of provisions to the inhabitants." The Glasgow authorities, however, were determined to have a harbor nearer than Irvine, and in 1662 they purchased 13 acres of ground on the south side of the river (now Port-Glasgow), where they built harbors and constructed the first graving dock in Scotland. In 1688 a quay was built at the Broomielaw, although nothing had yet been done for the deepening of the river. It was only after the city had experienced the vast importance of foreign traffic that the magistrates, most of whom were "tobacco lords," seriously turned their attention to the question. In 1740 the town council authorized the expenditure of £100 in making a deepening experiment below the Broomielaw quay, and fifteen years later they employed Smeaton the well-known engineer to report on the subject. He found the two shallowest places at the Pointhouse Ford, now the western boundary of the harbor, and at Hirst, now within the harbor. The depth at low water at the former was 15 inches, and at the latter 18 inches, while at high water it was 3 feet 3 inches and 3 feet 8 inches respectively. Smeaton proposed a lock and dam, four miles below Glasgow Bridge, so as to secure 4 feet 6 inches of water at the Broomielaw quay. Fortunately his report was not adopted. In 1768 the first beginnings were made on the report of Mr. John Golborne, who suggested the contraction of the river by the construction of rubble jetties and the removal of the shoals by dredging. James Watt reported in 1769 to the magistrates on the declivity of the bed of the Clyde from Broomielaw quay to that obdurate obstacle Dumbuck Ford. In 1773 Mr. Golborne contracted with the town council to make this ford 6 feet deep at low water and 300 feet wide,

and carried out his contract successfully in 1775. Rennie reported on the river in 1799, and recommended "the shortening of some of the jetties, the construction of new ones, and the building of low rubblo walls from point to point of the jetties so as to render the channel uniform, and prevent the accumulation of shoals." His suggestions were carried out, and upwards of 200 jetties were constructed between Glasgow and Bowling, the result being a considerable improvement in the navigation, and reclamation of land to the proprietors on both banks from the alveus of the river, the greater portion of which has since had to be purchased at high prices for other improvements. Telford reported in 1806, and Rennio again in 1807, and the deepening process went on without pause. In 1836 the engineer of the Clyde Trust reported to the trustees that there was then from 7 to 8 feet of water at the Broomielaw quay at low water, that the lift of a neap tide, which was only sensible in 1755, was 4 feet, and of a spring tido 7 or 8 feet, making a depth of 12 feet at high water of a neap and of 15 feet of a spring tide. The river had become capable of taking craft of 400 tons to Glasgow. In 1840 parliament sanctioned an Act for carrying out plans for the further improvement of the navigation of the entire river under the jurisdiction of the trustees. Upon the lines then laid down the improvements have ever since proceeded, with only very slight modifications, but the result may probably be best expressed in the following figures. In 1839 vessels of 17 feet draught of water were safely navigated to and from the harbor, in 1854 of 19 feet draught, in 1861 of 20 feet draught, in 1862 of 21 feet draught, and in 1870 of 22 feet draught. Only a few years ago vessels of 15 feet draught were two and often threo tides in the river in their passage up and down, but now vessels of 22 feet draught leaving Glasgow two or three hours before high water get to sea in one tide. The rapidity of the deepening process has been due almost entirely to the powerful steam dredgers employed by the trustees, to the use of the diving bell for blasting purposes, and latterly to the introduction of steam drilling and dynamite. The quantity of dredged matter taken from the river every year is somewhere about a million and a quarter of tons, which is carried off by barges and deposited in Loch Long, an arm of the Firth running up into the Western Highlands. During the last thirty-one years upwards of 20 million tons have been dredged from the river, and since the year 1770 the cost for dredging and depositing alone has been between £500,000 and £600,000. The total expenditure upon the river since the year above named has been upwards of seven millions sterling; and the revenue, which a hundred years ago was £1733, is now about £210,000. The first dock constructed at the Glasgow harbor was opened so late as 1867. Though Acts of parliament had been obtained more than twenty years before, the sides of the river were utilized for quayage extension; but within the last ten or twelve years the pressure for space became very great, and the new dock, which is tidal, and covers 5½ acres of water space, was found to be quite inadequate. A new Act was obtained in 1870 to construct docks at Stobcross, and these, which are now nearing completion, will have an area of 30 acres, and will accommodate one million tons of shipping. The estimated cost, including the purchase of land, is £1,163,000.

The traffic on the Clyde received an extraordinary impetus by the application of steam to navigation, and from the date of the "Comet," which was built on the Clyde in 1811–12 for Mr. Henry Bell, Glasgow has been the true home of steam navigation. The steam shipbuilding trade has become one of the largest industries of the city, and with its growth the commerce of Glasgow has kept pace. The river has been the fruitful source of the city's greatness. As the accessibility of the water-way became greater year by year, so the commerce and the industries of the city developed, and the material wealth increased. Glasgow, too, is fortunate in being the centre of an enormous coal and iron field, in the working of which she has greatly benefited. Her industries, now very numerous, are referred to in detail below. They embrace almost every species of manufacture to be found in Great Britain; and this variety is probably the reason for the all but uninterrupted prosperity of the city, for it is rare that every department of manufacture and commerce is dull at the same time. Her resources are so numerous that she is not much affected by stagnation in one or two branches. But Glasgow has undoubtedly come through one or two crises of a serious character in the course of her industrial career. In 1857 the failure of the Western Bank struck a hard blow at her trade and commerce, though it was wonderful how soon she recovered from the heavy loss and the derangement of commercial affairs which were caused by the failure. The American Civil War paralyzed the cotton manufactures of Glasgow, as it did those of Lancashire; but otherwise it did little harm, and the stimulus that was given to shipbuilding by the carrying trade of the world practically falling into British hands more than compensated for other losses. The close of the American War was followed by a period of commercial and industrial activity in the city, which, however, sustained a severe check within the last two years, during which time trade has been languishing everywhere. While enterprising citizens were looking forward with some slight hope for signs of a revival, the collapse of the City of Glasgow Bank on the 2d October, 1878, fell upon them like a thunderbolt. In a few days after the stoppage it was known that matters were far worse than the most sinister prophet of evil could have imagined, much lest foretold. The whole of the capital and reserve of the bank, amounting to close upon a million and a half sterling, was squandered, and nearly five and a quarter millions besides. The total loss cannot be set down at much less than eight millions sterling, and the most of this enormous sum had gone to support great Indian and colonial firms, which had been hopelessly bankrupt for years. The inquiry into the affairs of the bank revealed such recklessness and misconduct on the part of some of those who were responsible for its management that the manager and the directors were tried on a charge of fabricating and uttering false balance sheets. They were all convicted, and sentenced to varied terms of imprisonment. Since this gigantic failure Glasgow has been passing through the greatest crisis of its existence.

*Administration.*—The affairs of Glasgow are managed by a corporation consisting of 48 representatives of the 16 wards into which the city is municipally divided, and by one representative from the Trades' and one from the Merchants' House. The lord provost is the head of the corporation, and is assisted in his executive functions by 10 bailies. The bailies hear and decide cases in the police courts, aided by assessors, who are local legal practitioners of good standing. There is also a stipendiary magistrate who sits every day in the central police court, and undertakes the heavier portion of the cases. The dean of guild court has a certain jurisdiction over the construction of new and the alteration of old buildings. The corporation of Glasgow, since it became popularly elected, has shown great and enlightened interest in the welfare of the city. It has during the last quarter of a century acquired three public parks for the recreation of the citizens, and laid them out in an ornamental manner. Within the same period, too, it has undertaken and carried out immense works for a supply of water unequalled in the kingdom, has bought up the old gas-works and supplies artificial light within and beyond the municipal boundaries, and is at present engaged in bringing to a successful close a series of city improvements on a very large scale.

*City Improvements.*—As the last-mentioned work is the most important upon which the corporation has been engaged since the introduction of Loch Katrine water, and formed the model upon which Mr. Cross, the home secretary, framed his Artisans Dwellings Act, a slight sketch of the plan upon which it was founded may be given here.

The city had grown so fast in population during the present century that it had become greatly overcrowded, especially in the central portions. From the leading thoroughfares of High Street, Saltmarket, Trongate, Gallowgate, and Argyll Street long narrow closes and wynds penetrated into the densely-built spaces behind. The population in these regions varied from 400 to 1000 per acre, and the dirt, darkness, and foul air in which the poor creatures lived, made their homes breeding-places of fevers and disease of every kind. In some of the worst spots the death-rate was 70 per 1000 per annum. The closes and wynds, besides being dens of disease, were the haunts of the criminal class of the population, who were able to dispose of their plunder and escape the police with comparative ease in these deep alleys, many of them connected with each other by ways only known to the experienced criminal. Some benevolent citizens made a small effort at improvement about twenty years ago, by buying up one of the most notorious of these closes; but it was not till the City Union Railway was projected that the attention of the municipality was fairly called to the question, or that any step was taken by it. The Union Railway passed through some portions of the old town which were densely overcrowded, and it was suggested by the late Mr. Blackie, who was then chief-magistrate, that the corporation might work in harmony with the railway company, and clear out old and densely-crowded properties, which the railway only touched at certain spots. Mr. Carrick, the city architect, drew out improvement plans, and in 1866 an Act was passed by parliament enabling the corporation to acquire old over-crowded localities, to borrow money, and to levy rates. The improve-

ments contemplated involved the destruction of 10,000 houses, all of them really unfit for habitation, but which were filled by upwards of 50,000 souls. The corporation was bound by the Act to find accommodation for tbe dispossessed when tbe numbers exceeded 500. In point of fact, the corporation never required to build houses, as private enterprise more than kept pace with the operations of the improvement scheme. By the Act the corporation was empowered to borrow £1,250,000, and to levy a rate of 6d. per pound on the rental for five years, and 3d. per pound for ten years, by which time it was calculated the whole work would be completed. No sooner was the Act passed than tbe trustees—all of tbem members of the town council—proceeded to purchase the properties scheduled, a delicate and difficult task, which, however, was most economically carried out, first by Sir James Watson, and afterwards by Mr. James Morrison, the conveners. The work of demolition also went on; the densely-built districts were cleared out, open spaces and squares secured, streets driven through huge blocks of building, others widened, till now there is hardly a remnant left of tbe old notorious abodes of fever and crime. Tbere is still a good deal to do, and it may be necessary to get an extension of tbe time fixed in the Act, as it expires in 1881; but up to the present time upwards of 30,000 people have been turned out of their unhealthy homes, and have been provided with better ones elsewhere. So far the improvements have been very cheaply executed. The great amount of demolition effected by the trustees and the railway companies greatly raised the value of building ground in the central portions of the town; and the corporation bas been able to sell the properties which it had acquired at considerable profit, after utilizing large portions of them for streets and open spaces. The cost to the citizens will be the rates whicb have been and are to be levied; but perhaps to this should be added an uncertain amount represented by the rise of house rents. Up to May, 1878, the sum raised by rates was £305,867; and, adding to that other tbree years' rates, the total amount which the improvements will cost will be about £375,000, £40,000 of which was spent in buying a park for the use of the people in the north-eastern district of the city.

*Public Health.*—The result of these improvements has been a marked decrease in the mortality. In 1866 Glasgow was one of the least healthy towns in Great Britain; in 1877 it was nearly as healthy as London. In 1866 the annual death rate was 29·6 per thousand, and continued slightly rising or falling till 1875, when there was a fall to 28·7. This was the year in which the work of the improvement trustees began to tell. In 1876 the death rate was 25·2 per thousand, in 1877 it was 24·9, and in 1878 it was 25·0. The improvement scheme has done good otherwise in directing attention to sanitary questions of all kinds. There is now in Glasgow a public department of health, at the head of which there is a most efficient medical officer, and provision has been made for the isolation of contagious diseases immediately on their breaking out. Great attention is paid to cleansing the city, and fever epidemics, which not long ago were seldom absent, are now very rare, and hardly ever assume large proportions. Crime has also diminished as one of the results of the city improvements, and its detection is much surer.

There can be no doubt that the demolition of so large a number of small dwelling-houses in such a short period was no small grievance to those who inhabited them; not that there ever was any lack of accommodation, but because families had in many cases to remove to places at inconvenient distances from their work, and into houses which, though much better in a sanitary sense, were somewhat dearer. The distance difficulty, however, was greatly mitigated by the construction of tramways throughout the town, and by the authorities providing for the running of morning and evening workmen's cars at exceedingly low fares; and it is scarcely doubtful that the change from unhealthy and overcrowded houses into others roomier and built with some regard to sanitary principles has been a blessing to the lower class of the population. When the works are completed, Glasgow in its older regions will be a city transformed.

*Water Supply.*—Previous to 1859 Glasgow was supplied by water from the river Clyde and from ponds erected some miles south of the city, to which the water was conveyed by gravitation. The supply was insufficient, and the Clyde water bad. In 1848 the idea of bringing water from Loch Katrine was first spoken of. The citizens at that time began to see that something far more extensive than had ever been attempted was required to supply the rapidly growing wants of the city. Between 1848 and 1855 many schemes were proposed by the water companies and by private individuals, none of which came to anything. In 1852 the corporation took the matter up, and, after a long and arduous struggle, the Act for tapping Loch Katrine was carried in 1855. The corporation it is believed would have been defeated again but for the attention which Lord Palmerston paid to a subject in which Glasgow was so deeply interested, and for the influence which he brought to bear in favor of the works. The engineer selected to bring the water from a distance of 34 miles was Mr. J. F. Bateman, and four years after the passing of the Act the waters of the Highland loch, at the touch of Her Majesty the Queen, flowed into the city.

The sources of the supply are Loch Katrine with a surface of 3000 acres, Loch Vennacher with an area of 900 acres, Loch Drunkie, 150 acres,—altogether about 4000 acres of water surface, and containing within the limits to which they may be raised or lowered about 1,600,000,000 cubic feet of water. Tbe drainage area is 45,800 acres, and the rainfall is from 80 to 90 inches per annum. The source is ample for the supply of a population double that which is at present supplied, but the works are not more than sufficient to provide 50,000,000 of gallons of water per day, and it will be necessary before many years are past to construct other works, probably to double that quantity. Loch Katrine is 360 feet above the tide at Glasgow, which, allowing for tbe loss of fall, secures a pressure of 70 or 80 feet above the highest summit in tbe city. The water is conveyed by mined tunnels, built tunnels, aqueducts, and iron pipes. There are altogether 70 tunnels, one of which is 2650 yards and another 2325 yards in lengtb, and 8 feet in diameter. One of these works is 600 feet below tbe surface. The aqueducts over rivers and ravines of an important character are 27 in number; some of these are of iron and some of masonry. Twenty-six miles fromLoch Katrine and 7 or 8 from Glasgow a large reservoir was constructed, 70 acres in extent and capable of holding 500,000,000 gallons of water; and from this reservoir the water, having undergone a filtering process, is conveyed in pipes to Glasgow. Tbe engineering cost of the works was £700,000, or ten per cent, above tbe estimate, but as the contract was only for 20,000,000 gallons per day, and the actual product was 30,000,000 gallons, the cost cannot be said to have been excessive There have been great additions made to the works since they were opened in 1859, the total capital expenditure at the end of 1877 being a little over £2,000,000. The quantity of water brought into the city from Loch Katrine is now 30,000,000 gallons per day, but the area of distribution is much larger than Glasgow. In a very short time the corporation will be able to bring in 50,000,000 gallons a day, which is the limit of the capacity of their present works. Tho cost of the water to the inhabitants is 8d. per pound on the rental, and 1d. per pound is charged for public purposes. The quality of the water is excellent, and there can be no doubt that it has been an active agent in improving the health of the city. Besides the Loch Katrine works there is a supply of water from the Gorbals gravitation works amounting to rather more than four millions of gallons per day. Tbe consumption of water over the area of distribution is thus 34,000,000 gallons in tbe 24 hours, or 45 gallons for every man, woman, and child,—a very large supply even when deduction is made for the water used in large public works, and for purposes other than domestic.

*Lighting.*—In the parliamentary session of 1868–9 the corporation applied for and obtained powers to purchase the works of the two gas-light companies which had until that period supplied Glasgow and its suburbs with gas. The capital of these companies consisted of £415,000, on £300,000 of which the shareholders were entitled to profits not exceeding 10 per cent. per annum, the remaining £115,000 paying dividends at the rate of 7½ per cent. per annum. The corporation agreed to give for the works to the shareholders annuities of 9 per cent. on the stock which paid 10 per cent., and of 6¾ per cent. on the stock which paid 7½ per cent. These annuities were guaranteed by a six-penny rate upon the whole rental within the municipality. Besides these rates the corporation took over mortgages amounting to £119,265. It is needless to state that no rate has ever been levied upon rental for the maintenance of the gas-works, the manufacture having proved remunerative at a moderate charge per thousand cubic feet. The gas-works, as taken over by the corporation, were capable of producing 6,500,000 cubic feet; but since then they have been greatly extended at a cost of half a million sterling, and are now capable of making 12 million cubic feet of gas. The consumption varies between 2 million cubic feet in twenty-four hours in summer and 11 million cubic feet during the same time in winter. The area of supply includes nearly all the surrounding suburbs, in addition to the city. The cost of

gas to the consumer is 4s. per thousand cubic feet, and no rent is charged for the use of meters.

*Tramways.*—The next project with which the corporation has had to do in recent years has been laying down lines of tramways along the principal thoroughfares of the city. This work was undertaken for the purpose of preventing the control of the streets and the street traffic from passing out of the hands of the corporation; the cost was about £200,000 for 13½ miles of tramway; but this sum, with interest at 4½ per cent. per annum, is to be repaid in the course of twenty-three years by the lessees, who also keep up the roadway between the tramway lines, and pay a rent of £150 per mile per annum. The fares are one penny per mile, and the number of passengers carried is very great. Pecuniarily the tramways have been successful.

*Income and Expenditure.*—The income and expenditure of Glasgow are larger than those of many a flourishing state. The trusts, which till quite recently were semi-independent, but are now simply committees of the town council, are the police board, the water commissioners, the gas commissioners, the city improvement trustees, parks and galleries trust, market trust, etc. The revenues which they collect and distribute amount altogether to close upon one million sterling per annum. The common good of the city, that is to say, property belonging to the corporation, is estimated as being worth about £300,000, the interest of which is expended in maintaining what are called the city churches, and generally on municipal purposes for which the citizens are not taxed. The number of parliamentary voters in 1877–8 was 60,582, and the list of school-board electors, which includes all ratepayers, when the roll was last made up, numbered 112,897. Glasgow returns three representatives to the House of Commons since 1868, each elector having, however, only two votes. Previous to this, and from the passing of the great reform measure of 1832, the city had only two representatives. Glasgow has a police force of about 1000 men, which is maintained at an expense of £78,000 per annum, half of which is paid by the Government. The sheriff-depute of Lanarkshire holds his court in Glasgow, and is assisted by five sheriffs-substitutes resident in the city. The amount of legal work which is gone through in the disposal of civil and criminal cases is very great, being equal to about one-third of the whole disposed of in Scotland, including the supreme courts in Edinburgh.

*Bridges and Railway Stations.*—There are three fine bridges over the river within the municipal boundaries, and two iron suspension bridges. One railway bridge was erected a few years ago by the City Union Railway Company, and another by the Caledonian Railway Company is now nearly completed. All the bridges are free. Glasgow is the centre of a vast railway system, the Caledonian and Glasgow & South-Western Railways having their termini in the city; these work with the great English lines, the Midland and the London & North-Western Companies. The St. Enoch's Square station, which provides for the traffic over the Glasgow & South-Western, City Union, and Midland Companies, is one of the most spacious in the United Kingdom. The same companies are erecting an equally commodious goods station in High Street; the Caledonian Company, finding themselves greatly hampered for room at the old terminus in Buchanan Street, are building a colossal structure in Gordon Street; and the North British Company, which have their headquarters in Edinburgh, are greatly extending their present limited accommodation in Dundas Street.

*Public Buildings.*—There are not many of these of importance in Glasgow. The one which naturally attracts the greatest attention of strangers is the cathedral, which is now in a complete state of repair, and a few years ago, through the munificence of Glasgow citizens and of noblemen and gentlemen of the vicinity, its windows were filled with richly stained glass from one of the great stained glass establishments of Munich. The cathedral is acknowledged to be a fine specimen of Early English Gothic. It is situated in a good position in the north-east quarter of the city, and is about 104 feet above the Clyde level. Its form is that of a Latin cross with short transepts. The length from east to west is 319 feet, its breadth 63 feet, the height of the choir 93 feet, and of the nave 85 feet. At the intersection it has a tapering octagonal spire, the height of which is 225 feet. It contains 147 pillars and 159 windows. The crypt under the choir is exceedingly fine and complete. The Royal Exchange, in the centre of the city, contains a news-room 122 feet in length by 60 feet broad. Its portico is formed of 12 fluted Corinthian columns, supporting a rich frieze and pediment; the north and south sides of the building are ornamented by a colonnade of Corinthian pillars. The Royal Infirmary is in the Roman style of architecture from a design by Adams. It has been greatly extended since its erection in 1792. The City Hall is a plain building capable of holding upwards of 3000 people. The new Public Halls, opened in 1877, are the most recent addition to the architecture of the city. The building cost upwards of £80,000, and since its opening has been mainly used for musical entertainments, music being one of the arts which has been cultivated with the greatest success in Glasgow of late years. The principal hall in this fine building, which is of the classic style of architecture, is capable of holding between 4000 and 5000 persons. By far the grandest building in Glasgow, however, is the new university structure on Gilmorehill, which is described below. During the last thirty years a vast improvement has been made in Glasgow in church architecture. Dissenters who were satisfied in the earlier part of the century with plain meeting-houses now vie with each other, and with the Church of Scotland, in the elegance and adornment of their places of worship. There is probably no town in the United Kingdom which has spent more upon ecclesiastical buildings in recent times than Glasgow, or which in this respect has made greater improvements in taste. The Roman Catholics and Episcopalians, nearly one-fourth of the population of the city, have also erected some very fine ecclesiastical edifices. The street architecture of Glasgow has greatly improved, many of the large business firms having rebuilt their warehouses upon a splendid scale. The new post-office buildings in George Square also deserve mention. The work of the post-office of Glasgow has increased with the increase of the city, and is now practically larger than that of any other town save London. It was found necessary a few years ago to extend the accommodation, and now the greater part of one side of George Square is devoted to postal and telegraph purposes. The new buildings are plain but massive, and seem to have been planned on the principle of the least ornament with the most room. The corporation have obtained an Act for the erection of municipal buildings on the east side of George Square. Not without reason has Glasgow been called one of the best built cities of the empire, its substantial masonry owing much to the excellent quality of the material, a sandstone quarried in abundance all round the city.

*Statues.*—The public statues in Glasgow are not numerous, though several of them are very fine. Most of them are in George Square. The equestrian statue of the great duke of Wellington stands opposite the main entrance to the royal exchange, and that of William III. is close to the junction of Trongate with the Saltmarket, High Street, and Gallowgate, the ancient cross of the city. In George Square there are equestrian statues of the Queen and the late Prince Consort, a seated figure of James Watt, statues of Sir John Moore, Lord Clyde, Sir Robert Peel, Sir Walter Scott, James Oswald of Auchincruive, Thomas Graham the celebrated chemist, Robert Burns, Thomas Campbell, and David Livingstone. The statue of Burns, executed by Mr. George E. Ewing, a Glasgow sculptor, was subscribed for in shillings by the working classes of Scotland.

*University and Schools.*—Of the educational institutions of Glasgow precedence must be given to the university. As already stated this great seminary of learning was founded by Bishop Turnbull, who obtained a papal bull for the purpose, dated 7th January, 1450. By this bull a corporate body was formed, consisting of a chancellor, rector, and dean, with doctors, masters, regents, and students, in the several faculties into which it was divided. One of these was known as the pedagogium, or college of arts. This school of learning was first situated in Rottenrow (1459). James, Lord Hamilton, bequeathed to the principal regent of that college some buildings and several acres of land, on part of which in the High Street the college was afterwards erected. The college of arts was restored and endowed by James VI. During the period which intervened between 1577 and 1688 the university underwent many changes; but in the year 1693, each of the Scottish colleges having received a grant of £300 per annum out of the bishops' rents, the Glasgow institution again revived; and having received other public and private gifts, its progress has

been since uninterrupted. The academic body of the university consists of the chancellor, the lord rector, the dean of faculty, the principal and vice-chancellor, and the professors. The whole business of the university is transacted in three distinct courts, viz., the senatus, the faculty, and the comitia. There are many bursaries connected with the college, the most important being those bequeathed by Mr. Snell, by Mrs. Black, the widow of a late minister of the Barony church, and by Mr. Orr-Ewing, M. P. for Dumbartonshire. The college buildings in High Street were principally erected in 1593 and 1658. The spire, which was 153 feet in height, possessed a lightning conductor which was reared under the auspices of Franklin in 1772.

The present university buildings at Gilmorehill occupy a magnificent site above the Kelvin, overlooking the Kelvingrove Park, and commanding a splendid view of the valley of the Clyde. In 1860 the commissioners under the "Universities Scotland Act" reported that in the interests of the university it was necessary that the college should be rebuilt, and that the site which it occupied in High Street was most ineligible for the purpose of the university. In 1863 the promoters of the City of Glasgow Union Railway company offered to purchase the college grounds for the sum of £100,000, which was ultimately accepted; and during the negotiations Government offered to give £21,400, on condition that £24,000 for the erection of an hospital was raised by private subscription. On the 29th July, 1864, the lands of Gilmorehill, consisting of 43 acres, were purchased by the senate for £65,000; about six months later the adjacent lands of Donaldshill were secured for £16,000, and the property of Clayslaps, containing 5 or 6 acres, was bought for an hospital site for the sum of £17,400. Part of the lands of Gilmorehill not required for the university were advantageously sold to the corporation of Glasgow. Sir Gilbert Scott was appointed architect of the new buildings at the end of September, 1864, and the plans were completed and approved of in the beginning of 1866. The estimated cost of the building, including hospital, was £266,000—a sum far beyond the means of the university authorities. The citizens of Glasgow, however, came heartily to their help, and subscribed liberally to the building fund. In January, 1868, Government agreed to give £120,000, on condition that the same amount was raised by private subscriptions. The work at once progressed under these assurances of support, and on the 8th October, 1868, the foundation stone of the new buildings was laid by the Prince of Wales. In 1870 the buildings were so far completed that the removal from High Street took place, the last meeting of the senatus in the old college buildings having been held on 28th July of that year. The financial difficulty, however, proved a very serious one. The cost of the buildings greatly exceeded the estimate, and went far beyond the funds placed at the disposal of the senatus, although the public subscriptions amounted to nearly £160,000. The fine building is therefore up to the present time incomplete. The tower had to be stopped when less than half-way up, and the grand hall, designs of which were prepared by Sir Gilbert Scott, is still untouched. The senatus, however, has now been practically relieved of its difficulties by the splendid contributions of the marquis of Bute and of Mr. Charles Randolph, one of the pioneers of steam shipbuilding on the Clyde. The marquis has given £40,000 for the erection of the common hall, and Mr. Randolph bequeathed £60,000 for the completion of the buildings. With these sums at its disposal the senatus will no doubt in a few years finish this noble structure, and it will then be unequalled, so far as the building is concerned, as an educational institution.

The following notes, descriptive of the new buildings, are from the pen of the architect:—

The architectural style of the building is founded on that of works of the 14th century, subject to some modifications introduced with a view to giving the building a character allied to that of the old Scottish buildings. It is probable, however, that during the 14th century this specific character may not have prevailed in Scotland. It seems, in fact, to have been introduced from France at a later period, and worked up with so much originality into buildings in Scotland as to have become quite received as the style of the country. In France it had existed at least from the 13th century, so that what has been done in the design of the college is to *translate back* the characteristics in question, and to unite them with the general style of the architecture of the 14th century, though in Scotland they may not probably have actually existed till a later date. As the building stands on the crown of a hill, whose principal and rapid slope is toward the south, it has been made to occupy, as far as may be, the whole of the ridge facing in that direction by a long and continuous front of about 540 feet in length. In advance of this lengthened façade is a system of terraces, bringing the ground down by gradual steps towards the Kelvin, which flows through a deep ravine along its base. The southern façade comprises three more lofty portions, a central block and two corner towers, between which are two ranges of buildings of smaller elevation. The centre of the line of building facing the south is occupied by a lofty tower, through which, on the ground floor, is the principal entrance to the building. There is also a gateway through the centre of each of the lower ranges of building, arched and groined, leading into the east and west quadrangles. Another main entrance is provided in the central block of the northern range of building. This entrance consists of a double gateway, the passages from which turn round to meet one another in the basement within the building. Much in the same manner, the north side of the building is divided into five parts, the angle blocks forming towers, similar to those in front; but facing each quadrangle there is a building of great dimensions, one of which is devoted to the museum and the other to the library. Between these is a central block, in this case of less elevation than the main side portions, containing the students' reading-room below and the hall of the Hunterian museum above.

The whole rectangular range of buildings, thus briefly described, is about 540 feet in length by 300 feet in breadth, occupying a greater part of the crown of the hill. From it to the west extend the different ranges of the principal's and professors' houses, while towards the south-east the outline is prolonged and diversified by the chemical laboratory, a partially detached building of octagonal form, and, at the north-east, by the anatomical rooms. The library and museum are alike in design. There are two great halls in each, occupying respectively the ground and first floors, these being 129 feet long by 60 feet wide.

Anderson's College, formerly called Anderson's (or the Andersonian) University, was founded by John Anderson, professor of natural philosophy in the university of Glasgow in 1795, and endowed by him with valuable philosophical apparatus, a museum, and a library. It is governed by 81 trustees, and its object is to bring literary and scientific education within the reach of the mass of the community. Every branch of study taught in Glasgow university is provided for, with the exception of divinity. Drs. Garnett and Birbeck were the original professors of natural philosophy and chemistry; Dr. Ure and Thomas Graham also occupied chairs in this college; and it was there that the first mechanics' class was established in Great Britain. The trustees contemplate the removal of the institution to the west end of the city, where it is believed it will greatly extend its sphere of usefulness. The number of students in 1878 was 986; and those attending popular evening classes, at which lectures are delivered in various branches of science, numbered 992.

The High School or Grammar School, formerly in John Street and under the charge of the corporation, is the oldest educational institution in the city. It appears that a grammar school existed in Glasgow early in the 14th century, being then dependent on the cathedral church. Up to 1834 its masters taught only Latin and Greek, but at that period the school underwent a complete alteration. Two of the classical masterships were suppressed, and in lieu of these teachers of English grammar, foreign languages, writing, arithmetic, geography, mathematics, and drawing were introduced. The name was also changed from the grammar school to the high school. The school was up to 1873 under the control of the corporation, but it was in that year placed under the jurisdiction of the school board of the city. In 1878 the school was removed to Elmbank Street, to the premises occupied by the Glasgow academy—a commodious building. The high school has been greatly improved by the school board, and is now one of the best secondary educational establishments in Scotland. It has upwards of 500 pupils. There are other secondary schools in Glasgow that are doing good educational work. Among these may be mentioned the Glasgow academy, the Kirklee academy, and the schools belonging to Hutcheson's hospital. There is also a Government school of design well attended, a technical school recently instituted, the mechanics' institution, founded in 1832, for the purpose of diffusing a knowledge of science among the working classes, the athenæum, which draws its students

principally from the lower middle class, and the normal schools belonging to the Church of Scotland and the Free Church, for the training of teachers.

The passing of the Education (Scotland) Act in 1872 gave Glasgow an opportunity of dealing practically with the dense ignorance that prevailed within her boundaries. Before the Act passed it was believed that at least 20,000 (possibly far more) children in the city received no education whatever. The school board has persistently dealt with these uneducated waifs, and the most of this large ignorant mass have been reached. There are now not more than 3000 children of school age who are not receiving some education in the board and other schools. The school board rate in the city is 4d. per pound on the rental. The amount raised per annum is about £30,000.

*Libraries, Museums, etc.*—The libraries open to the public are Stirling's public library, a large collection of literature, and famous for its tracts of the 16th and 17th centuries, and the Mitchell public library, established a few years ago by the munificence of a citizen of Glasgow, who left about £80,000 for the purpose. This library is under the management of the town council, and during the short period of its existence has collected a large number of valuable books. It is meant to be a consulting library. The college library is very extensive, but can only be used by alumni of the university. An industrial museum was instituted some years ago in the old residential building of the West End Park. An addition was made to it about three years since, and the collection is now very considerable. It is supported under the Parks and Galleries Act, as are also the corporation galleries of art, a collection of pictures and statuary, acquired partly by purchase but more largely by donation and bequest. The galleries contain a very valuable series of old Dutch masters, and there is a noble statue of Pitt by Chantrey. The Hunterian and Andersonian museums are accessible to the public. The Hunterian contains a noble collection of anatomical subjects, and a most valuable assortment of coins. There is a botanical garden in Glasgow, but this has never been worthy of the city.

*Theatres.*—The drama has always been tolerably well patronized in Glasgow, which now contains some half dozen theatres.

*Commercial Institutions.*—The Chamber of Commerce was instituted in 1783, for the purpose of encouraging and protecting trade, and keeping a watchful eye on whatever might be supposed to affect the commercial interests of Glasgow and its neighborhood. There are eight banks and branch banks in the city, two of them being properly Glasgow institutions; they are all joint-stock companies. In 1815 the first attempt was made in Glasgow to establish an institution for the accumulation of the savings of the community, the Provident Bank. This and some others of a like kind in 1836 were all merged in the National Savings Bank, which has had a most successful career. The deposits now amount to about £2,771,066, and the depositors are 104,329 in number.

*Parks.*—The city is specially well provided with public parks, although not more than a quarter of a century has elapsed since it possessed only one—Glasgow Green—a noble expanse along the north bank of the river, which was long neglected and uncared for. Since that time Kelvingrove Park, in the Kelvin valley at the west end of the city, was acquired, and laid out under the direction of Sir Joseph Paxton, and it has been frequently added to. At a later date the Queen's Park, on the southern outskirts, was formed; and subsequently the city improvement trust expended £40,000 on the purchase and laying-out of the Alexandra Park on the north-east side of the city. These parks are all liberally maintained by the parks and galleries trust of the town council.

Glasgow has been almost exclusively a commercial city within the last half century. As wealth increased culture also increased, though more slowly. The university has always been the centre of intelligence in the city, and many of its professors have been conspicuous for their devotion to the applications of pure science to the development of the arts and manufactures. Of the great names connected with this institution it may suffice to mention Baillie, whose letters on the troubles of the 17th century, recovered by the late Dr. Laing of Edinburgh, added considerably to our knowledge of that period, and Professors Adam Smith and Thomas Reid. James Watt, though not a member of the university, was generously protected by it when the burgesses of Glasgow refused to allow him to open shop within the jurisdiction of the trades house and magistrates of the city. There are many literary men, and poets of the minor class, who claim Glasgow as their birthplace, but none of them reached sufficient eminence to claim particular notice. Of the practical workers who by their mechanical aptitude, amounting in many cases to genius, have pushed on the industries of the city, it is impossible here to give even meagre biographical details. The commercial capital of Scotland has prospered more by the general energy and indomitable perseverance of its inhabitants than by the special genius of individuals.

INDUSTRIES.—The most outstanding feature in the industrial position of Glasgow is the great variety and wide range of its manufacturing and trading activity. While no one of the great industries occupies a position of predominant importance so as to stamp itself as the peculiar characteristic of the town, there are numerous leading departments of industry which have been long established and are prosecuted on a great scale, while a variety of special manufactures have found their principal centre in Glasgow and the Clyde valley. When to this fact is added the consideration that Glasgow is one of the three principal seaports of the United Kingdom, it will at once be obvious that the wealth and prosperity of the city are contributed to by many separate and important streams. The circumstances and conditions which have favored the establishment of the leading industries in Glasgow are quite as varied as are the industries themselves. The abundance of pure water in the hill streams around the city led at an early date to the introduction of bleaching, calico-printing, and allied pursuits; and these, in their turn, reacted favorably on hand-loom weaving and other textile manufactures. In a similar way the first beginnings of the now great chemical industries are clearly related to the early stages of the bleaching and printing trades. The fact, however, that the town is actually built within the richest coal and ironstone field in Scotland has had, of all causes, the most important influence in determining the current and prosperity of local industries. Further, the river Clyde, rendered navigable for vessels of the largest tonnage, flowing through the centre of that great coal and iron region, presents incomparable facilities for the prosecution of shipbuilding and marine engineering. But beyond the advantages of natural position and mineral wealth it is right to say that Glasgow owes much of her industrial prestige to a long line of highly-gifted, ingenious, sagacious, and energetic citizens, whose influence has not only been stamped on local industries, but has been felt and acknowledged throughout the entire world.

The principal industries of Glasgow range themselves under the heads separately noted below. With respect to many of them it is a matter of regret that no trustworthy source of specific information exists; and thus the origin, vicissitudes, and progress of really important trades can only be recorded in vague and general terms.

*Textile Manufactures.*—The industries embraced under this head were the first which gave Glasgow a place among the great manufacturing communities; but though, through many changes and fluctuations, they continue to yield extensive employment, they now occupy a comparatively secondary position. In the cotton trade, which originated about 1780, Glasgow possesses several factories which are reckoned among the largest in the trade; the industry has, however, for a number of years been in a stationary if not declining condition. The manufacture of light textures has always been the leading feature of the Glasgow trade,—plain, striped, and figured muslins, ginghams, and fancy fabrics forming the staple. Thread manufacture, although specially a Paisley industry, is also extensively prosecuted in Glasgow. According to a return obtained in 1875 the whole cotton industry of Scotland afforded employment to 33,276 individuals, and excepting about 10 per cent. it was entirely centred in Glasgow and the surrounding district. Jute and silk are staples worked only to an inconsiderable extent in Glasgow, though about a century ago the manufacture of silk gauze flourished extensively, and has left traces of its former importance to the present day. The most characteristic of woollen and worsted manufactures is carpet weaving, all the leading kinds of carpets being extensively made, and the "tapestry" curtains and portières made by several firms are examples of highly artistic woollen fabrics.

*Bleaching, Printing, and Dyeing.*—These allied industries took root in the Glasgow district at an earlier period than that of their introduction into the rival regions of Lancashire, calico-printing having been begun near Glasgow in 1738. The use of chlorine in bleaching was first introduced in Great Britain at Glasgow in 1787, on the suggestion of the illustrious James Watt, by his father-in-law, a local bleacher; and it was a Glasgow bleacher—Charles Tennant—who first made and introduced bleaching powder (chloride of lime). The dyeing of Turkey red was begun as a British industry at Glasgow by two eminent citizens—David Dale and George M'Intosh—

and that unequalled color was long locally known as Dale's red. All these industries continue to hold a foremost place in Glasgow, a large amount of grey cloth being sent from the Lancashire looms to be bleached and printed in the Scotch works. In particular, Turkey red dyeing and printing have developed to an extent unequalled in any other manufacturing centre.

*Chemical Manufactures.*—The operations of bleaching and calico-printing in the early part of last century gave rise to such chemical manufactures—the preparation of dye liquors, etc.—as these industries demand. The discovery of bleaching powder by Charles Tennant in 1799 led directly to the development of the great chemical works of C. Tennant & Co. at St. Rollox and its various branches, and gave the first great impetus to chemical manufactures in Glasgow. Among the prominent chemical industries are to be reckoned the alkali trades—including soda, bleaching powder, and soap-making—the preparation of alum and prussiates of potash, bichromate of potash manufacture (an industry peculiarly identified with Glasgow), the extraction of iodine and other products from seaweeds, dynamite and gun-powder manufacture, the making of flint glass, bottle glass, paper, white-lead and other pigments, and brewing and the distillation of spirits. The numerous chemical preparations used in the bleaching and calico-printing trades are also among the local manufactures, as well as the preparation of starch, British gum, and dextrine, and the manufacture of lucifer matches.

*Iron Manufacture and other Metallurgical Industries.*—Although the blast furnaces of Scotland are distributed over several of the midland counties, the great proportion of them are in Lanarkshire and Ayrshire, and the trade is entirely controlled and practically monopolized in Glasgow. The discovery of the value of blackband ironstone by Mushet and the invention of the hot-blast by Neilson were two events which exercised a wonderful influence on the development of iron smelting in Scotland. So rapid was the expansion of the industry during the earlier half of this century that in 1859 one-third of the whole iron produced in the United Kingdom was Scotch. For 20 years past the trade has shown little elasticity, the annual production averaging about a million of tons of pig iron,—the maximum output having been reached in 1870, when 1,206,000 tons were smelted. In 1877 of a total of 152 furnaces existing there were 109 in blast, and of the whole 131 were situated in Lanarkshire and Ayrshire, 102 of these being in operation. The entire output of pig iron in that year was 982,000 tons, while in 1878 from 90 furnaces in blast the production is estimated at 902,000 tons. The number of malleable iron works in Glasgow and its neighborhood is 22, having had during 1877 345 puddling furnaces and 53 rolling mills in operation. Mild steel is manufactured on an extensive scale by the Siemens-Martin process, and a small amount of crucible cast steel is also made. Other metallurgical industries include the extraction of copper by Henderson's wet process, and a limited amount of zinc smelting.

*Engineering.*—With abundance of iron and coal, and great facilities of both land and water carriage, it is only to be expected that mechanical engineering should be carried on in Glasgow with peculiar energy and success. Almost all departments of engineering work are well represented in the district; and among the special features of the industries may be enumerated the great water and gas pipe casting establishments, sanitary and general iron-founding, malleable iron tube making, locomotive engine building, the manufacture of sugar machinery and of sewing machines,—two great establishments on the model of American factories for the latter trade being conducted by the Singer and the Howe Machine Companies respectively. The marine engineering works of the Clyde—which in many instances are worked in direct connection with shipbuilding yards—are equipped on a scale worthy of the great industry of which they form an important part; and few establishments exist in any other quarter capable of producing the enormous forgings for propeller shafts, etc., of ocean steamers, which form a regular item in the undertakings of Glasgow engineering firms.

*Shipbuilding* is the greatest of all the modern industries of Glasgow, and the position attained by the shipbuilders of the Clyde is a matter of imperial consequence and national pride. The shipbuilding yards of the Clyde extend from Rutherglen above Glasgow to Greenock,—Dumbarton, Port-Glasgow, and Greenock having an important stake in the industry. In some years about half the total tonnage built in the United Kingdom has been launched from the Clyde yards, as is shown by the following statement:—

| | 1871. | 1872. | 1873. | 1874. | 1875. | 1876. | 1877. |
|---|---|---|---|---|---|---|---|
| Tonnage launched, Clyde | 196,229 | 230,347 | 232,926 | 262,430 | 211,482 | 174,824 | 169,383 |
| Tonnage launched, United Kingdom | 391,058 | 474,718 | 453,543 | 603,867 | 472,058 | 378,020 | 450,963 |

During the year 1878 the tonnage launched on the Clyde from the yards of 35 different firms amounted to 222,353 tons, one vessel, the "Gallia," built for the Cunard Company, being of 5200 tons burthen,—a tonnage, however, which has been exceeded by the Guion steamer "Arizona" (5500 tons), launched in 1879. The work turned out is very diversified, but as a rule of the highest class, and includes armor-plated and other vessels for the Royal Navy, mail and passenger ocean steamers for the great Transatlantic and other lines, river steamboats famous throughout the world for swiftness and elegance of appointments, merchant sailing vessels, dredging plant, and hopper barges. With the exception of a very insignificant proportion of wooden vessels, the whole of the shipping built on the Clyde is of iron and steel, the latter having recently been introduced with great success. The shipbuilding trade in Glasgow indeed owes its extraordinary expansion almost entirely to the rapid supplanting of wood by iron as a building material. Twenty years ago, in 1859, the tonnage launched measured only 35,709 tons, from which amount, by rapid strides, it reached in 1863 a total of 123,262 tons, and in 1874 the maximum amount o 262,430 tons was floated off.

Commerce.—For a century past the records of the Clyde Navigation Trust indicate that the trade of Glasgow, so far as regards shipping, has progressed, with few and unimportant fluctuations, with steady rapidity. In 1778 the annual revenue of the Clyde Trust was £1733; in 1828 it amounted to £17,669, a tenfold increase in 50 years; and in 1878 the total amounted to £217,100. Of course these figures do not necessarily indicate a corresponding expansion of shipping trade, though they probably bear a close relation to the comparative value of cargoes carried. In the year 1828 the tonnage of vessels of all kinds which arrived in the harbor of Glasgow was 696,261, the sailing vessels having numbered 4405 of 214,315 tons, and the steamers 7100 of 481,946 tons. For the year ending 30th June, 1878, the arrivals of sailing ships numbered 2727, with 457,290 tons capacity, and of steamers there were 13,210, the tonnage of which amounted to 2,154,733 tons,—in all 15,937 arrivals with a gross tonnage of 2,612,023 tons, being the greatest amount on record. In that year the weight of goods imported from abroad was 658,319 tons; and coastwise 586,576 tons were landed at Glasgow, making in all 1,244,895 tons. The foreign imports consisted in largest measure of Indian corn, wheat, flour, and other food substances, with timber, pyrites, iron ore, and sulphur, the coasting arrivals containing principally limestone, iron, cement, potter's clay, salt, timber, and food stuffs. The goods shipped to foreign ports amounted to 712,249 tons, and coastwise 603,374 tons left Glasgow, making in all 1,315,623 tons. The principal exports were coal, iron, cast pipes, chairs and other railway iron, chemical manufactures, and general machinery, with malt liquors and spirits; and in the coasting trade the leading articles were of a similar general description. The great bulk of the foreign trade is with New York and Canadian ports, India, France, Spain, and Belgium; and coasting traffic beyond the Clyde estuary is directed principally to Liverpool, Belfast, Dublin, Londonderry, Waterford, Bristol, and London; but there are few commercial ports throughout the world which have not more or less direct trading communication with the port and harbor of Glasgow (J. H. S.—J. PA.)

GLASS. History.—The art of glass-making, unlike that of pottery, would appear not to have been discovered and practised by different nations independently, but to have gradually spread from a single centre. No trace of it was observed among the inhabitants of America at the time when that continent was discovered, although considerable progress in the arts had been made by some among them, *e. g.*, the Mexicans and Peruvians; but the steps by which it reached China may be indicated with much probability The credit of the invention was given by the ancients to the Phœnicians, as is shown by the well-known story of its fortuitous discovery by Phœnician merchants, who rested their cooking pots on blocks of natron (sub-carbonate of soda), and found glass produced by the union under heat of the alkali and the sand of the shore (Pliny, *Nat. Hist.*, xxxvi. 26, 65). A glassy mass may, however, be produced in the smelting of many metallic ores, silica being present, while the fuel supplies the alkali; or by the combustion of great masses of reeds or straw, in which the elements of glass are present,—lumps of coarse imperfect glass being often found on the spot where a stack of wheat has been burned. Now the Egyptians practised metallurgic operations from a very early period, and vast heaps of straw are, and no doubt have been from the earliest times, accumulated in that country, and probably not unfrequently set on fire. The adoption of glass as a substance capable of being made subservient to the use of mankind may therefore be due to the intelligence of some one who noticed its fortuitous production there. Be this as it may, by far the earliest examples of glass existing of which the dates are attested by inscriptions are of Egyptian origin. The earliest of these, a small lion's head of opaque

Egyptian glass.

blue glass of very fine color, but changed externally to an olive green, was found at Thebes by Signor Drovetti, and is now in the British Museum;[1] on the underside are hieroglyphics containing the name of Nuantef IV. whose date according to Lepsius's chronology was 2423–2380 B. C. A bead of dusky green glass bears the prænomen of Hatasu, a queen who is conjectured to have lived about 1450 B. C. (Wilkinson, *Manners and Customs of the Ancient Egyptians*, vol. iii. p. 88). That such may be the real dates of these objects is confirmed by the fact that glass bottles containing red wine are represented on monuments of the fourth dynasty, more than 4000 years old; and in the tombs at Beni Hasan, dating from the reign of Usurtesen I., at least 2000 years B. C., the process of glass-blowing is represented in an unmistakable manner (Wilkinson, vol. iii. p. 89). Very many examples of glass found in Egypt may be seen in museums, but as they rarely bear inscriptions, it would be difficult to trace the progress of the art through them; no competent person has hitherto undertaken the task. The manufacture probably continued to flourish as well during the period of the native monarchy as in that of the Greek dynasty; and its importance after the subjugation of the country to Rome was probably even increased by the new market then opened to its products. Martial (*Ep.*, xxi. 74) alludes to the importation of Egyptian glass into Rome; and it is mentioned in an ordinance of Aurelian. Hadrian in a letter addressed to the consul Servianus mentions glass-blowing as one of the chief industrial occupations of the inhabitants of Alexandria. The manufacture was not confined to that city, but was also carried on in the lower Diospolis on Lake Mensaleh, as appears by a passage in the *Periplus Maris Erythræi* (c. 6).

Much of the Egyptian glass was uncolored and of a somewhat dusky hue; of the colored and ornamental varieties perhaps the most characteristic examples are the small vases usually in the form of either alabastra or amphoræ, but occasionally in that of an Egyptian column. In these the prevailing color is a deep transparent blue, but not unfrequently the color of the body of the vase is some shade of pale buff, fawn, or white (an imitation probably of arragonite, Egyptian alabaster), sometimes deep green, and in rare cases red. In almost every example the surface is ornamented by bands of color, white, yellow, or torquoise blue, forming zigzag lines; in some examples there are only two or three such lines, in others the whole surface is covered by them. These lines are incorporated with the surface of the vessel, but do not penetrate through its entire thickness. By the Greeks and Etruscans such vessels were evidently much valued; the amphoræ have been occasionally found in tombs, furnished with a stand of gold. In Rhodes and elsewhere they have been found associated with objects which probably do not date from an earlier period than the 3d or 4th century before Christ, and it does not appear that they are met with in tombs later than the Christian era; when colored or ornamental glass vessels are discovered in these last, they are of a different character. Another species of glass manufacture in which the Egyptians would appear to have been peculiarly skilled is the so-called mosaic glass, formed by the union of rods of various colors in such a manner as to form a pattern; the rod so formed was then reheated and drawn out until reduced to a very small size, a square inch or less, and divided into tablets by being cut transversely, each of these tablets presenting the pattern traversing its substance and visible on each face. This process was no doubt first practised in Egypt, and is never seen in such perfection as in objects of a decidedly Egyptian character in design or in color. Very beautiful pieces of ornament of an architectural character are met with, which probably once served as decorations of caskets or other small pieces of furniture, or of trinkets; also tragic masks, human faces, and birds. Some of the last-named are represented with such truth of coloring and delicacy of detail that even the separate feathers of the wings and tail are well distinguished, although, as in an example in the British Museum, a human-headed hawk, the piece which contains the figure may not exceed three-fourths of an inch in its largest dimension. Works of this description probably belong to the period when Egypt passed under Roman domination, as similar objects, though of inferior delicacy, appear to have been made in Rome.

Phœnician. The Phœnicians probably derived their knowledge of the art from Egypt; whether this be so or not, they undoubtedly practised it from a very early period and to a very large extent. Probably much the same processes were employed in Phœnicia and Egypt during some centuries before the Christian era, as they certainly were in Phœnicia, Egypt, and Rome for some centuries after. It seems probable that the earliest products of the industry of Phœnicia in the art of glass-making are the colored beads which have been found in almost all parts of Europe, in India and other parts of Asia and in Africa. The "aggry" beads, so much valued by the Ashantees and other natives of that part of Africa which lies near the Gold Coast, have probably the same origin. These colored beads are usually of opaque glass; they exhibit great variety of color and pattern, and very different degrees of skill in manipulation. Their wide dispersion may be referred with much probability to their having been objects of barter between the Phœnician merchants and the barbarous inhabitants of the various countries with which they traded. It is probable, however, that many of the specimens which exist in our museums date from times several centuries later than those in which Tyre and Sidon flourished; for, as we may learn from the *Periplus* and Strabo, glass in various forms was an article imported in the 1st and 2d centuries, as well into the emporia of the Red Sea as into the ports of Britain. Even at the present day beads are very extensively made at Venice for export to Africa, which bear a resemblance, doubtless not accidental, to those which we have reason to believe to be of very early date.

Assyrian. Next in date to the earlier Egyptian examples mentioned above would appear to be the vase of transparent greenish glass found in the north-west palace of Nineveh, and now in the British Museum. On one side of this a lion is engraved, and also a line of cuneiform characters, in which is the name of Sargon, king of Assyria, 722 B. C. Fragments of colored glasses were also found there, but our materials are too scanty to enable us to form any decided opinion as to the degree of perfection to which the art was carried in Assyria. Many of the specimens discovered by Layard at Nineveh have all the appearance of being Roman, and were no doubt derived from the Roman colony, Niniva Claudiopolis, which occupied the same site.

Greek. The Greeks, excellent in the ceramic art, do not appear to have cultivated the art of glass-making at a very early period; but it was probably made in many places on the shores of the Mediterranean for some centuries before the Christian era. At Mycenæ many disks of opaque vitreous pastes were found by Schliemann, and very similar objects at Ialyssus in Rhodes; but it is not certain that these may not have been brought from Egypt, where very similar objects have been found, or whether they ought not to be attributed to Greek or to Phœnician artisans. At Camirus in Rhodes, however, many vessels of glass of very elegant forms have been discovered, which were probably made in the island.

In Etruscan tombs in Italy are also found glass vessels of peculiar character; these are small bowls resembling in form the half of an egg; they are usually of the variety of glass which is mentioned further on as "madrepore," the ground green and transparent, the stars yellow, while patches of color of gold and of filigree glass are sometimes interspersed. They differ from and appear to be earlier than the madrepore glass, fragments of which are so often found in Rome. They are also said to be found in Magna Græcia. Another variety found in tombs in the same district is of blue and opaque glass, with much gold in leaf, all twisted together; the most frequent form in which this kind of glass has been found is that of a bottle several inches long and about one inch in diameter, without a neck, having probably had a mounting of gold. It remains to be determined whether these should be attributed to a Greek or to a Phœnician origin. Glass, however, was occasionally used for purposes of architectural decoration during the best period of Grecian art, for Stuart and Revett, when describing the temple of Minerva Polias at Athens, give the following note:—"A remarkable singularity observed in the capitals of this portico is in the plaited torus between the volutes having been inlaid at the interstices with colored stones or glass." Mr. H. March Phillips states that he well remembers having remarked these decorations, and that he believes them to be of blue glass.[1]

[1] See introduction to *Catalogue of Glass Vessels in the South Kensington Museum*, where an engraving of it is given.

[1] An example of the employment of glass in a like manner is indicated by the odd story which Pliny tells (*Nat. Hist.*, xxxvii. 5, 17)

Roman.

In the first centuries of our era the art of glass-making was developed at Rome, and other cities under Roman rule, in a most remarkable manner; and it reached a point of excellence which in some respects has never been excelled or even perhaps equalled. It may appear a somewhat exaggerated assertion that glass was used for more purposes, and in one sense more extensively, by the Romans of the imperial period than by ourselves in the present day; but it is one which can be borne out by evidence. It is true that the use of glass for windows was only gradually extending itself at the time when Roman civilization sank under the torrent of German and Hunnish barbarism, and that its employment for optical instruments was only known in a rudimentary stage; but for domestic purposes, for architectural decoration, and for personal ornaments glass was unquestionably much more used than at the present day. It must be remembered that the Romans possessed no fine porcelain decorated with lively colors and a beautiful glaze; Samian ware was the most decorative kind of pottery which was then made. Colored and ornamental glass held among them much the same place for table services, vessels for toilet use, and the like, as that held among us by porcelain. Pliny (*Nat. Hist.*, xxxvi. 26, 67) tells us that for drinking vessels it was even preferred to gold and silver. Trebellius Pollio, however, relates of the emperor Gallienus that he drank from golden cups, despising glass, than which, he said, nothing was more vulgar. Glass was largely used in pavements, and in thin plates as a coating for walls. It was used in windows, though by no means exclusively, mica, alabaster, and shells having been also employed. Glass, in flat pieces, such as might be employed for windows, has been found in the ruins of Roman houses, both in England and in Italy, and in the house of the faun at Pompeii a small pane in a bronze frame remains. Glass of this description seems to have been cast on a stone, and is usually very uneven and full of defects; although capable of transmitting light, it must have given at best an indifferent view of external objects. When the window openings were large, as was the case in basilicas and other public buildings and even in houses, the pieces of glass were, doubtless, fixed in pierced slabs of marble or in frames of wood or bronze.

The invention and ingenuity employed by the Roman artisans in producing variety in glass vessels are most remarkable; almost every means of decoration appears to have been tried, and many methods of manipulating glass, which have been considered inventions, have in reality been anticipated by the glass-workers of the period under consideration. The fertility of invention which devised so many modes of ornamentation and so many shades of color, and the skill with which the manual execution is carried out, alike deserve great admiration. This prodigious variety seems to show that glass-making was at that time carried on, not as now in large establishments, which produce great quantities of articles identical in form and pattern, but by many artificers, each working on a small scale. This circumstance enables us to understand why very pure and crystalline glass was, as Pliny tells us, more valued than any other kind. To produce glass very pure and free from striæ and bubbles, long-continued fusion is required; this the system of working of the ancients did not allow, and their glass is in consequence remarkable for the great abundance of bubbles and defects which it contains.

The Romans had at their command, of transparent colors, blue, green, purple or amethystine, amber, brown, and rose; of opaque colors, white, black, red, blue, yellow, green, and orange. There are many shades of the former as well as of the latter, particularly of transparent blue, and of opaque blue, yellow, and green. Of opaque colors many varieties appear to be due to the mixture of one color with another. In any large collection of fragments it would be easy to find eight or ten varieties of opaque blue, ranging from lapis lazuli to turquoise or to lavender, and six or seven of opaque green. Of red the varieties are fewer; the finest is a crimson red of very beautiful tint, and there are various gradations from this to a dull brick red. One variety forms the ground of a very good imitation of porphyry; and there is a dull semi-transparent red which, when light is passed through it, appears to be of a dull green hue. With these colors the Roman *vitrarius* worked, either using them singly or blending them in almost every conceivable combination, sometimes, it must be owned, with a rather gaudy and inharmonious effect.

These combinations of color were effected in two ways:—first, by glasses of two or more colors being combined so as to traverse the entire substance of the object; and, secondly, by the superposition of the one color on the other.

To the former class belong all those termed mosaic and mille fiori, where the process of manufacture was the preliminary union, by heat, of threads of glass into a rod, which when cut transversely exhibited the same pattern in every section. Such rods were placed together side by side, and united by heat into a mass which was then formed into cups or other vessels. A vast quantity of small cups and pateras were made by this means in patterns which bear considerable resemblance to the surfaces of madrepores, and are of the same kind as those which by the Venetians are termed "mille fiori." In these every color and every shade of color seem to have been tried in great variety of combination with effects more or less pleasing, but transparent violet or purple appears to have been the most common ground color. Although most of the vessels of this mille fiori glass were small, some were made of large size; a fragment in the possession of the present writer must have formed part of a dish not less than 20 inches in diameter. Another variety of glass, evidently much used, is that in which transparent brown glass is so mixed with opaque white and blue as to resemble onyx. This was sometimes done with great success, and very perfect imitations of the natural stone were produced. Sometimes purple glass is used in place of brown, probably with the design of imitating the precious murrhine. Imitations of porphyry, of serpentine, and of granite are also met with, but these were used chiefly in pavements, and for the decoration of walls, for which purposes the onyx-glass was likewise employed. Under this head must also be included the interlacing of bands and threads both of white and of colored glass. Vessels are found composed of bands either so placed in sections as to present a plaited pattern, or simply arranged side by side; others, again, resemble the Venetian vitro di trina, threads of opaque white or yellow glass being twisted with clear transparent glass, and the vessel then formed by the welding together of the rods so made. Blue threads are occasionally intermixed, and several varieties of pattern may be found; but this branch of the art does not appear to have been carried by the Romans to anything like the perfection to which it was afterwards brought by the Venetians.

So few examples of glass vessels of this period which have been painted in enamel have come down to us that it has been questioned whether that art was then practised; but several specimens have been recently described which can leave no doubt on the point; decisive examples are afforded by two cups found at Vaspelev, in Denmark, engravings of which are published in the *Annaler for Nordisk Oldkyndeghed* for 1861, p. 305. These are small cups, 3 inches and $2\frac{1}{2}$ inches high, $3\frac{3}{4}$ inches and 3 inches wide, with feet and straight sides; on the larger are a lion and a bull, on the lesser two birds with grapes. and on each some smaller ornaments. On the latter are the letters DVB . R. The colors are vitrified and slightly in relief; green, blue, and brown may be distinguished. They were found with Roman bronze vessels and other articles. Vessels also are not uncommon on the surface of which enamel colors appear in the form of spots; it is probable that these were applied in the form of melted glass, not, as in true enamel painting, in that of a finely divided powder tempered with an essential oil and applied cold.

The first place among those processes in which one color was superimposed on another may be given to that by which the cameo glass was produced. In this a bubble of opaque white glass was formed at the end of the tube used by the glass-blower; this was coated with transparent blue, and that again with opaque white, and the vessel required was formed from this threefold globe. The outer coat was then removed from that portion which was to constitute the ground, leaving the white for the figures, foliage, or other ornamentation; these were then sculptured by means of the gem-engraver's tools. Pliny no doubt means to refer to this when he says (*Nat. Hist.* xxxvi. 26, 66), "aliud

that on the tomb of Hermias, a prince of the island of Cyprus, was a marble figure of a lion with eyes of emerald which shone so brightly into the sea that they frightened away the tunnies from the adjacent fisheries, so that it became necessary to change the eyes. In the great marble lion discovered by Mr. Newton near Cnidus, and now in the British Museum, in the place of the eyes are deep sockets which probably, like those of the Cypriote lion, were filled with colored glass.

argenti modo cælatur," contrasting it with the process of cutting glass by the help of a wheel, to which he refers in the words immediately preceding, "aliud torno teritur."

The famous Portland or Barberini vase is the finest example of this kind of work which has come down to us, and was entire until it was broken into some hundred pieces by a drunken medical student some years ago. The pieces, however were joined together by Mr. Doubleday with extraordinary skill, and the beauty of design and execution may still be appreciated almost as well as when it was intact. A letter written by Wedgwood in 1786 to Sir William Hamilton has been published in the life of the former by Miss Meteyard (vol. ii. p. 577), which contains some interesting remarks upon this beautiful work of art. He concludes with the assertion, "I do not think £5000 for the execution of such a vase, supposing our best artists capable of such a work, would be at all equal to their gains from the works they are now employed in." It is true that the gem-engravers of that day received very high pay for their work.

The two other most remarkable examples of this cameo glass are an amphora at Naples and the Auldjo vase. The amphora measures 1 foot $\frac{5}{8}$ inch in height, 1 foot 7½ inches in circumference; it is shaped like the earthen amphoras with a foot far too small to support it, and must no doubt have had a stand, probably of gold; the greater part is covered with a most exquisite design of garlands and vines, and two groups of boys gathering and treading grapes, and playing on various instruments of music; below these is a line of sheep and goats in varied attitudes. The ground is blue and the figures white. It was found in a house in the Street of Tombs at Pompeii in the year 1839, and is now in the Royal Museum at Naples. It is well engraved in Richardson's *Studies of Ornamental Design*. The Auldjo vase, a part of which is or was in possession of Mr. Auldjo, and another in the British Museum, is an œnochoe about 9 inches high; the ornament consists mainly of a most beautiful band of foliage, chiefly of the vine, with bunches of grapes; the ground is blue and the ornaments white; it was found at Pompeii in the house of the faun. It also has been engraved by Richardson.

Costly as these beautiful objects must have been, a very great number of them existed, for even now fragments of ten to fifteen may probably be met with in the hands of the curiosity dealers in Rome in the course of three or four months. The same process was used in producing large tablets, employed, no doubt, for various decorative purposes. In the South Kensington Museum collection is a fragment of such a tablet or slab; the figure, a portion of which remains, could not have been less than about 14 inches high.

The ground of these cameo glasses is most commonly transparent blue (often lined with opaque white to throw up the color), but sometimes opaque blue, purple, or dark brown. The superimposed layer, which is sculptured, is generally opaque white. A very few specimens have been met with in which several colors are employed.

At a long interval after these beautiful objects come those vessels which were ornamented either by means of coarse threads trailed over their surfaces and forming rude patterns, or by colored enamels merely placed on them in lumps; and these, doubtless, were cheap and common wares. But a modification of the first-named process was in use in the 4th and succeeding centuries, showing great ingenuity and manual dexterity,—that, namely, in which the added portions of glass are united to the body of the cup, not throughout, but only at points, and then shaped either by the wheel or by the hand. The attached portions form in some instances inscriptions, as on a cup found at Strasburg, which bears the name of the emperor Maximian (286–310 A. D.), on another in the Vereinigte Sammlungen at Munich, and on a third in the Trivulzi collection at Milan, where the cup is white, the inscription green, and the net-work blue. Probably, however, the finest example is a situla, 10½ inches high by 8 inches wide at the top and 4 inches at the bottom, preserved in the treasury of St. Mark at Venice. This is of glass of a greenish hue; on the upper part is represented, in relief, the chase of a lion by two men on horseback accompanied by dogs; the costume appears to be Byzantine rather than Roman, and the style is very bad. The figures are very much undercut. The lower part has four rows of circles united to the vessel at those points alone where the circles touch each other. All the other examples have the lower portion covered in like manner by a network of circles standing nearly a quarter of an inch from the body of the cup.[1]

The art of glass-making no doubt, like all other art, deteriorated during the decline of the Roman empire, but it is probable that it continued to be practised, though with constantly decreasing skill, not only in Rome but in the provinces. Some few existing vessels, as two chalices of coarse blue glass in the British Museum, may perhaps be referred to this period, but the most remarkable production was mosaic for the decoration of churches. Examples of such decorations may be still seen in Rome dating from every century through the dark ages; and, though glass for mosaic was certainly made at Constantinople, and perhaps also at Ravenna, it is probable that it was also made in Rome. Glass was largely used in the immense windows of the churches built between the 3d and the 10th centuries. The first mention of colored glass in a church window occurs in the time of Pope Leo III. (795–816); but probably it was used at a much earlier period.

Byzantine.

Some of the Roman artificers in glass no doubt emigrated to Constantinople, and it is certain that the art was practised there to a very great extent during the Middle Ages. One of the gates near the port took its name from the adjacent glass-houses. St. Sophia when erected by Justinian had vaults covered with mosaics and immense windows filled with plates of glass fitted into pierced marble frames; some of the plates, 7 to 8 inches wide and 9 to 10 high, not blown but cast, which are in the windows, may possibly date from the building of the church. Glass for mosaics was also largely made and exported. In the 8th century when peace was made between the caliph Walid and the emperor Justinian II., the former stipulated for a quantity of mosaic for the decoration of the new mosque at Damascus, and in the 10th century the materials for the decoration of the niche of the kibla at Cordova were furnished by Romanus II. In the 11th century Desiderius, abbot of Monte Casino, sent to Constantinople for workers in mosaic. The grounds of the Byzantine mosaics were usually either of gold or silver, a thin leaf of the metal having been enclosed between two layers of glass.

We have in the work of the monk Theophilus, *Diversarum Artium Schedula*, and in the probably earlier work of Eraclius, about the 11th century, instructions as to the art of glass-making in general, and then as to that of producing colored, gilt, and enamelled vessels, which these writers speak of as being practised by the Greeks. But we look almost in vain for existing specimens of such works. Perhaps the only entire enamelled vessel which we can confidently attribute to Byzantine art is a small vase preserved in the treasury of St. Mark at Venice, a very clever reproduction of which was exhibited by the Murano Glass Company at the Paris exhibition of 1878. This is decorated with circles of rosettes of blue, green, and red enamel, each surrounded by lines of gold; within the circles are little figures evidently suggested by antique originals, and precisely like similar figures found on carved ivory boxes of Byzantine origin dating from the 11th or 12th centuries. Two inscriptions in Cufic characters surround the vase, but they, it would seem, are merely ornamental and destitute of meaning. The presence of these inscriptions may perhaps lead to the inference that the vase was made in Sicily, but by Byzantine workmen.[2]

Of uncolored glass brought from Constantinople several examples exist in the treasury of St. Mark at Venice, part of the plunder of the imperial city when taken by the crusaders in 1204. The glass in all is greenish, very thick, with many bubbles, and has been cut with the wheel; in some instances circles and cones, and in one the outlines of the figure of a leopard have been left standing up, the rest of the surface having been laboriously cut away. The

[1] An example connected with the specimens just described is the cup belonging to Baron Lionel de Rothschild; though externally of an opaque greenish color, it is by transmitted light of a deep red. On the outside, in very high relief, are figures of Bacchus with vines and panthers, some portions being hollow from within, others fixed on the exterior. The changeability of color may remind us of the "calices versicolores" which Hadrian sent to Servianus.

[2] The Sano Catino at Genoa, supposed throughout the Middle Ages to have been an emerald but really composed of green glass, is a shallow hexagonal dish rather clumsily formed and finished by cutting. It was perhaps originally a paten, and was taken at the capture of Cæsarea in 1101. At Reichenau in the Lake of Constance, is (or was) preserved a slab of transparent green glass 2 feet wide by 13 inches high and 3 inches thick, which was also supposed to be an emerald. According to tradition it was sent to Charles the Great by the empress Irene.

intention would seem to have been to imitate vessels of rock crystal.

Alexandria. Probably at Alexandria, one of the great seats of glass-making, the art survived the conquest of Egypt by the Saracens, for a glass disk serving as a weight has been met with in Egypt bearing the date 96 of the Hegira, corresponding with 715 A. D. (see memoir by Mr. E. T. Rogers, *Journal of the Royal Asiatic Society*, vol. x. pt. 1). Numerous later examples leave no doubt that the manufacture of glass continued to exist in Egypt, though perhaps in a languishing condition. In the 11th century, however, we find in the life of St. Odilo, abbot of Fulda (*ob.* 1049), mention of a "vas pretiosissimum vitreum Alexandrini generis," and in the same century Nasir Ibn Khusru (*Safarnamah*, published by Royal Asiatic Society), who visited Jerusalem in 1060, says that pictures of our Lord and others in one of the churches of that city were covered with plates of glass. No examples of ornamental vessels dating from this period have, however, come down to us. But we have many very remarkable examples of the skill of Egyptian and Syrian glass-workers in the 13th and 14th centuries,—large bottles, basins, and lamps, very striking objects from the free use of enamel and gilding in their decoration. This is, as in most objects of Eastern art, chiefly composed of inscriptions written in large characters ornamentally treated; but figures of birds, lions, sphinxes, etc., may be found, especially on vessels made in Egypt. Although there may have been some indigenous practice of the art of glass-making in the East,—for in the cup of Chosroes I. of Persia (531–579) preserved in the Bibliothèque Nationale at Paris are medallions of colored and moulded glass,—the arts of gilding and enamelling, as we see them exhibited in the

Syria. Syrian and Egyptian works of the 13th and 14th centuries, were probably derived from the Byzantines. Damascus was also the seat of a like manufacture. In inventories of the 14th century, both in England and in France, mention may frequently be found of glass vessels described as of the manufacture of Damascus. That city was taken by Timur in 1402, and we are told by Clavijo, who visited his court in 1403–1406, that he carried off to Samarcand "men who made bows, glass, and earthenware, so that of these articles Samarcand produces the best in the world."

Persia. Glass no doubt continued to be made, as it still is, in Syria and Persia, but no very remarkable products of the manufacture are known in Europe, with the exception of some vessels brought from Persia, blue richly decorated with gold. These probably date from the 17th century, for Chardin tells us that the windows of the tomb of Shah Abbas II. (*ob.* 1666) at Kom were "de cristal peint d'or et d'azur." At the present day bottles and drinking vessels are made in Persia which in texture and quality differ little from ordinary Venetian glass of the 16th or 17th centuries, while in form they exactly resemble those which may be seen in the engravings in Chardin's *Travels*.

India. Pliny states (*Nat. Hist.*, xxxvi. 26, 66) that no glass was to be compared to the Indian, and gives as a reason that it was made from broken crystal; and in another passage (xii. 19, 42) he says that the Troglodytes brought to Ocelis (Ghella near Bab-el-Mandeb) objects of glass. We have, however, very little knowledge of Indian glass of any considerable antiquity. A few small vessels have been found in the "topes," as in that at Manikyala in the Punjab, which probably dates from about the Christian era; but they exhibit no remarkable character, and fragments found at Brahminabad are hardly distinguishable from Roman glass of the imperial period. The chronicle of the Singhalese kings, the Mahawanso, however, asserts that mirrors of glittering glass were carried in procession in 306 B. C., and beads like gems, and windows with ornaments like jewels, are also mentioned at about the same date. If there really was an important manufacture of glass in Ceylon at this early time, that island perhaps furnished the Indian glass of Pliny; or it is possible that it really came from China. Glass is made in several parts of India—as Behar and Mysore—by very simple and primitive methods, and the results are correspondingly defective. Black, green, red, blue, and yellow glass is made. The greater part is worked into bangles, but some small bottles are blown (Buchanan, *Journey through Mysore*, vol. i. p. 147; vol. iii. p. 369).

China. The history of the manufacture of glass in China is obscure, but the common opinion that it was learnt from the Europeans in the 17th century seems to be erroneous. A writer in the *Mémoires concernant les Chinois* (vol. ii. p. 46) states on the authority of the annals of the Han dynasty that the emperor Ou-ti (140 B. C.) had a manufactory of the kind of glass called "lieou-li," that in the beginning of the 3d century of our era the emperor Tai-tsou received from the West a considerable present of glasses of all colors, and that soon after a glass-maker came into the country who taught the art to the natives.

The Wei dynasty, to which Tai-tsou belonged, reigned in northern China, and at this day a considerable manufacture of glass is carried on at Po-shan-hien in Shantung, which it would seem has existed for a long period. The Rev. A. Williamson (*Journeys in North China*, i. 131) says that the glass is extremely pure, and is made from the rocks in the neighborhood. The rocks are probably of quartz, *i. e.*, rock crystal, a correspondence with Pliny's statement respecting Indian glass which seems deserving of attention.

Whether the making of glass in China was an original discovery of that ingenious people, or was derived *via* Ceylon from Egypt, cannot perhaps be now ascertained; the manufacture has, however, never greatly extended itself in China. The case has been the converse of that of the Romans; the latter had no fine pottery, and therefore employed glass as the material for vessels of an ornamental kind, for table services and the like. The Chinese, on the contrary, having from an early period had excellent porcelain, have been careless about the manufacture of glass. A Chinese writer, however, mentions the manufacture of a huge vase in 627 A. D., and in 1154 Edrisi (first climate, tenth section) mentions Chinese glass. A glass vase about a foot high is preserved at Nara in Japan, and is alleged to have been placed there in the 8th century. It seems probable that this is of Chinese manufacture. A writer in the *Mémoires concernant les Chinois* (vol. ii. pp. 463 and 477), writing about 1770, says that there was then a glass-house at Peking, where every year a good number of vases were made, some requiring great labor because nothing was blown (rien n'est soufflé), meaning no doubt that the ornamentation was produced not by blowing and moulding, but by cutting. This factory was, however, merely an appendage to the imperial magnificence. The earliest articles of Chinese glass the date of which has been ascertained, which have been noticed, are some bearing the name of the emperor Kienlung (1736–1796), one of which is in the South Kensington Museum.

In the manufacture of ornamental glass the leading idea in China seems to be the imitation of natural stones. The colored glass is usually not of one bright color throughout, but semi-transparent and marbled; the colors in many instances are singularly fine and harmonious. As in 1770, cutting is the chief method by which ornament is produced, the vessels being blown very solid.

Diffusion of the art in Europe. The chief source from whence a knowledge of the art of glass-making spread through Europe was probably Rome; in the Roman imperial period glass was undoubtedly made, not only in Italy, but also in France, in Spain, and in all probability at or near Cologne, and perhaps in other places near the Rhine. Whether refugees from Padua, Aquileia, or other Italian cities carried the art to the lagoons of Venice in the 5th century, or whether it was learnt from the Greeks of Constantinople at a much later date, has been a disputed question. It would appear not improbable that the former was the case, for it must be remembered that articles formed of glass were in the later days of Roman civilization in constant daily use, and that the making of glass was carried on, not as now in large establishments, but by artisans working on a small scale. It seems certain that some knowledge of the art was preserved in France and in Spain, possibly even in England, and it seems improbable that it should have been lost in that archipelago, where the traditions of ancient civilization must have been better preserved than in almost any other place. In 523 Cassiodorus writes of the "innumerosa navigia" belonging to Venice, and where trade is active there is always a probability that manufactures will flourish. However this may be, the earliest positive evidence of the existence at Venice of a worker in glass would seem to be the mention of Petrus Flavianus, phiolarius, in the ducale of Vitale Falier in the year 1090. In 1224 twenty-nine persons are mentioned as friolari (*i. e.*, phiolari), and in the same century "mariegole" or codes of trade regulations

Venice and Murano.

were drawn up (*Monografia della Vetraria Veneziana e Muranese*, p. 219). The manufacture had then no doubt attained considerable proportions; in 1268 the glass-workers exhibited decanters, scent-bottles, and the like; in 1279 they made, among other things, weights and measures. In the latter part of this century the glass-houses were almost entirely transferred to Murano. From thenceforward the manufacture continued to grow in importance; glass vessels were made in large quantities, as well as glass for windows. The earliest example which has as yet been described—a cup of blue glass, enamelled and gilt—is, however, not earlier than about 1440. A good many other examples have been preserved which may be assigned to the same century: the earlier of these bear a resemblance in form to the vessels of silver made in the west of Europe; in the later an imitation of classical forms becomes apparent. Enamel and gilding were freely used, in imitation no doubt of the much-admired vessels brought from Damascus or Egypt. Many of the ornamental processes which we admire in Venetian glass were already in use or were invented in this century; as that of mille fiori, in which rods of various colors are joined by heat and so arranged as when cut transversely to form patterns resembling flowers or coral-lines. Such sections were then placed side by side and united by a lining of heated glass applied to them; the joint mass was then reheated and worked into the desired form. The beautiful kind of glass known as vitro di trina or lace glass, was made by a variation of the same process; the rods or canes, being composed of opaque white threads surrounded by transparent glass, were placed side by side in a mould, and a bubble of glass blown into the midst so as to adhere to the canes; the whole was then reheated and fashioned in the same manner as any ordinary glass. Sometimes two canes or cylinders were used, the lines of which ran in opposite directions, and a reticulated pattern was thus produced. An elaborate account of the process is given by M. Labarte (*Histoire des Arts Industriels*, iv. 575 *sq.*). Many of the examples of this process exhibit surprising skill and taste, and are among the most beautiful objects produced at the Venetian furnaces. Glass was made by the Romans in like manner, but no ancient example which has come down to us equals in correct execution some of those made at Venice. That peculiar kind of glass usually called schmelz, an imperfect imitation of calcedony, was also made at Venice in the 15th century. Avanturine glass, that in which numerous small particles of oxide of copper are diffused through a transparent yellowish or brownish mass, was not invented until about 1600.

The peculiar merits of the Venetian manufacture are the elegance of form and the surprising lightness and thinness of the substance of the vessels produced. The glass on the other hand wants brilliancy, and is often tinged with yellow, or if, as is not uncommon, too much manganese (which neutralizes the yellow tinge imparted by the presence of iron) has been used a faint purple. This slight coloration may not, however, appear a defect to eyes fatigued by the brilliancy of modern flint glass. The Venetian workmen perhaps somewhat abused their skill by giving extravagant forms to vessels, making drinking glasses in the forms of ships, lions, birds, whales, and the like.

Besides the making of vessels of all kinds the factories of Murano had for a long period almost an entire monopoly of two other branches of the art—the making of mirrors and of beads. Attempts to make mirrors of glass were made as early as 1317 A. D., but even in the 16th century mirrors of steel were still in use. To make a really good mirror of glass two things are required—a plate free from bubbles and striæ, and a method of applying a film of metal with a uniform bright surface free from defects. The principle of applying metallic films to glass seems to have been known to the Romans, and even to the Egyptians, and is mentioned by Alexander Neckam in the 12th century, but it would appear that it was not until the 16th century that the process of "silvering" mirrors by the use of an amalgam of tin and mercury had been perfected. During the 16th and 17th centuries Venice exported a prodigious quantity of mirrors, but France and England gradually acquired knowledge and skill in the art, and in 1772 only one glass-house at Murano continued to make mirrors.

The making of beads was probably practised at Venice from a very early period, but the earliest documentary evidence bearing on the subject does not appear to be of earlier date than the 14th century, when prohibitions were directed against those who made of glass such objects as were usually made of crystal or other hard stones. In the 16th century it had become a trade of great importance, and about 1764 twenty-two furnaces were employed in the production of beads. Towards the end of the same century from 600 to 1000 workmen were, it is stated, employed on one branch of the art, that of ornamenting beads by the help of the blow-pipe. A very great variety of patterns was produced; a tariff of the year 1800 contains an enumeration of 562 species and a vast number of sub-species. Beads to the value of £200,000 are still annually made in Venice (*Monografia della Vetraria Veneziana e Muranese*).

The efforts made in France, Germany, and England, in the 17th and 18th centuries, to improve the manufacture of glass in those countries had a very injurious effect on the industry of Murano. The invention of flint glass in England (about 1620?) brought in its train the practice of cutting glass, a method of ornamentation for which Venetian glass from its thinness was ill-adapted. One remarkable man, Giuseppe Briati, exerted himself, with much success, both in working in the old Venetian method and also in imitating the new fashions invented in Bohemia. He was especially successful in making vases and circular dishes of "vitro di trina," one of the latter in the Correr collection at Venice, believed to have been made in his glass-house, measures 55 centimetres (nearly 23 inches) in diameter. The vases made by him are as elegant in form as the best of the Cinquecento period, but may perhaps be distinguished by the superior purity and brilliancy of the glass. He also made with great taste and skill large lustres and mirrors, with frames of glass ornamented either in intaglio or with foliage of various colors. He obtained a knowledge of the methods of working practised in Bohemia by disguising himself as a porter, and thus worked for three years in a Bohemian glass-house. In 1736 he obtained a patent at Venice to manufacture glass in the Bohemian manner. He died in 1772.

The fall of the republic was accompanied by interruption of trade and decay of manufacture, and in the last years of the 18th and beginning of the 19th century the glass-making of Murano was at a very low ebb. In the year 1838 Signor Bussolin revived several of the ancient processes of glass-working, and this revival was carried on by C. Pietro Biguglia in 1845, and by others, and later by Salviati, to whose successful efforts the modern renaissance of the glories of Venetian art glass is principally due. Salviati revived the former processes and practised them, not in mere slavish imitation, but with freedom, invention, and fine artistic instinct. Every general industrial exhibition has contained brilliant examples of the products of the Venice and Murano Glass Company, composed chiefly of English capitalists, and formerly managed by Salviati.

The fame of Venice in glass-making so completely eclipsed that of Italian cities that it is difficult to learn much respecting their progress in the art. It appears, however, that as early as 1295, furnaces had been established at Treviso, Vicenza, Padua, Mantua, Ferrara, Ravenna, and Bologna. In 1634 there were in Rome two and in Florence one glass-house; but whether any of these produced ornamental vessels, or only articles of common use and window glass, would not appear to have as yet been ascertained.

Western Europe during Roman period.

The history of glass-making in France, Spain, Germany, and England offers many points of resemblance. In the first three, and probably in England also, glass was made at the period of the Roman empire; in France about Lyons, as is shown by a monument in the Musée Lapidaire to one Julius Alexander, described as an "opifex artis vitriæ," in Normandy and Poitou, and probably in many other parts. In Spain glass, according to Pliny, was manufactured (*Nat. Hist.*, xxxvi. 26, 66) in many parts of the country, "per Hispanias," but the remains of Roman glass-making have been chiefly found in the valleys which run down to the coast of Catalonia, but also near the mouth of the Ebro, in Valencia and in Murcia (Señor Rico y Sinobus, *Del Vidrio*, p. 11).

Glass-making in Germany during the Roman period would seem to have been carried on extensively at Cologne, near which city many remarkable glass vessels of peculiar character have been discovered. The art was probably not lost during the period which followed the downfall of the Roman power. In the year 758, Cuthbert, abbot of Jarrow,

wrote to Lullo, bishop of Mainz, to request him to send him a maker of glass vessels. It is scarcely probable that the art had been forgotten and revived between the 5th and the 8th centuries.

It is not equally clear that glass was made in England, though it is probable that this was the case. Both vessels and window glass have been found in almost all parts of the country, and at Buckholt, near the Roman road from Winchester to Salisbury, the remains of a glass furnace, among which were numerous fragments of glass which may possibly have been of Roman origin, and a fragment of undoubtedly Roman pottery. But associated with these were fragments of glass of the 14th and later dates, and of pottery of the 16th century.

The dark ages.

Very little has been ascertained as to the practice of the art in either of the four countries during the dark ages, but it would seem to have been preserved in France and Germany, and perhaps also in England and Spain. The fact narrated by Bede, in his history of the abbots of Wearmouth, that Benedict Biscop about 675 procured workmen from France to make glass for his monastery, shows at once that it was preserved in France and lost or nearly so in England. But a great quantity of drinking vessels are found in the tombs of the Anglo-Saxons while still pagan; and although the like are found both in France and in Germany, it is said that a greater number and more varieties occur in England, and it has thence been inferred that they were probably made in the country. Welsh poets of the 6th century (?), Aneurin and Llywarch Hen, both mention glass vessels by a name, "wydr," evidently derived from vitrum, and it is possible that the Welsh retained a knowledge of its manufacture. Some knowledge of the art of manipulating glass existed in Ireland in and before the 12th century, as is shown by cameo heads and small pieces of mosaic glass of quite peculiar patterns which occur on objects of Irish workmanship (*Transactions of the Royal Irish Academy*, vol. xxiv., Antiq., part iv.).

In France "vitrarii" are mentioned in several centuries from the 6th to the 11th; in Germany, as has been shown above, there is ground for believing that the art was practised in the 8th century; and in the 12th artisans are found at Cologne with the designation "ustor" attached to their names, which Merlo (*Künst und Künstler in Köln*, p. 563) suggests may probably mean maker of glass. Nothing seems to have been ascertained about the existence of the art in Spain between the Gothic conquest and the 13th century, when it was practised at Almeria by the Moors.

Mediæval period.

During the mediæval period France produced large quantities of glass, as well in the form of vessels as in that of window glass. The first were made on a large scale in Dauphiné in the 14th century. In 1338 Humbert the dauphin granted a part of the forest of Chamboraut to a glass-maker on condition that he should furnish him with more than 3000 vessels of glass annually (*Hist. Dalph.*, ii. 363). In 1302 window glass was made at Bezu le Foret, in the department of the Eure, for the king of France; a fragment of a roll of accounts for that year is preserved in the Bibliothèque Nationale. Glass was also made in Poitou, and a drageoir with the arms of Charles VIII. of France (1470–1498) has been engraved by M. Fillon (*L'art de Terre*, etc.) which is believed to have been made in that province.

Much glass was no doubt made for windows both in Germany and the Low Countries, during the Middle Ages, and in 1453 mention occurs of a fountain and four plateaux made for Philip the Good, duke of Burgundy, by a glass-maker of Lille; but if artistic objects were made, hardly any examples have been preserved. Glass-makers existed at Vienna in 1221 (Peligot, *Le Verre*, p. 342). In 1428 a Muranese artificer set up a furnace in the same city, and another was established by another Italian in 1486, which it is said was still at work in 1563. How far these efforts to rival the manufactures of Murano may have succeeded we have no information, but contemporaneously the native artificers continued to produce articles for common use, as we may see by the woodcut in the edition of George Agricola *De Re Metallica*, published at Basel in 1561, representing the interior of a glass-house. In this the tall cylindrical drinking-glasses known as wiederkoms, bottles with big bellies and slender necks, and retorts may be seen. A glass-house was founded at Daubitz in Bohemia in 1442, others in 1504 (Peligot, *Le Verre*, p. 343).

In England vessels of glass seem to have been but little used during the Middle Ages; they occur very rarely in inventories, and when they do, as in the Calendars of the Treasury of the Exchequer, they are usually described as mounted in gold or silver, or as painted, being probably enamelled glass vessels from Constantinople, Damascus, or Venice, objects rather of virtu than of daily use. It has even been asserted that there is no evidence that any description of glass was made in England before the 15th century, but in the roll of the taxation made at Colchester in 1295 three of the principal inhabitants are designated "verrer;" and it would seem hardly probable that so many in such a town were glaziers only and not glass-makers. In the 14th century Andrew le glasswright is mentioned in the records of Great Yarmouth. In 1439 (or 1447) English glass is mentioned in the contract for the windows of the Beauchamp chapel at Warwick, but disparagingly, as the contractor binds himself not to use it. In 1485, however, it is mentioned in such a manner as to lead to the conclusion that it was dearer and presumably better than either "Dutch, Venice, or Normandy glass" (*Domestic Architecture of the Middle Ages*, by Hudson Turner, p. 78).

In Spain glass was made at Barcelona in considerable quantities in 1324; and Almeria, according to an Arab author of the 13th century, was famous for its manufacture of glass. In the 15th century the export of glass from Barcelona was considerable; Jeronimo Paulo in 1491 says that glass vessels of various sorts were sent thence to many places and even to Rome.

16th century.

In the 16th century the fashion of using glass vessels of ornamental character spread from Italy into France, England, and the Low Countries. Henry VIII. had a large quantity, chiefly or wholly, it would seem, of Venetian manufacture (see inventory in 1542, *Archæological Journal*, vol. xviii.). This increasing use of glass led to the reflection that large sums of money went annually to Venice for such wares, and to the question whether the manufacture might not be carried on at home. We therefore find that about the middle of this century attempts were made to introduce the Venetian methods of manufacture into the several countries; Henry II. of France established an Italian named Mutio at St. Germain-en-Laye, and Henry IV. in 1598 permitted two "gentilshommes verriers" from Mantua to settle themselves at Rouen in order to make "verres de cristal et autres ouvrages qui se font à Venise." A like attempt was made in England about 1550, for in that year eight glass-makers from Murano addressed from London a petition to the Council of Ten at Venice praying to be excused from the penalties decreed by that body in 1549 against Venetian subjects who taught the art to foreigners (*Cal. State Papers*, Venetian, No. 648). The council allowed the eight workmen to remain until the end of the term for which they had engaged themselves. Other attempts followed: Stow says (*Chron.*, p. 1040) that Venice glasses were first made in London by one Jacob Vessaline about the beginning of the reign of Queen Elizabeth, and in 1565 one Cornelius de Lannoy (or Launoy) was working in the pay of the Government (*Cal. State Papers*, Dom.). Others, as Carre or Quarre, and Becku *alias* Dolin, from the Low Countries, were engaged in similar undertakings during the latter part of this century, but it does not seem that any great success was attained, as the importation of glass from Venice continued until long after.

These attempts to rival Murano seem to have been most successful in the Low Countries and in Spain. Ambrozio de Mongarda had a privilege in the former country to make "voirres de cristal à la faschon de Venise," which in 1599 was continued to Philippe de Gridolphi; his glass-house was at Antwerp. Glass-works also existed at Liége. Much glass in the 16th century was sent from Antwerp to England (Houdoy, *Les Verreries à la façon de Venise*). This manufacture went on during the following century, and many examples remain, more or less resembling the products of Murano.

In Germany Ferdinand I. established a glass-house at Weidlingen near Vienna, which was to work in the Italian manner; but no great success it would seem attended these efforts, partly no doubt because about the same time the native glass-makers struck out a new and original style of ornamentation for the great cylindrical beakers, sometimes 20 inches in height, usually called wiederkom (come again), but which M. Peligot says ought to be called willkomm (welcome). This was a somewhat coarse but very effective

system of painting in enamel such subjects as the emperor and electors of Germany, or the imperial eagle bearing on its wings the arms of the states which composed the empire, etc. The earliest example which has been met with bears the date 1553, but the system had great vogue, and continued in use until about 1725.

Spanish writers have not as yet acquainted us with the precise means by which the Venetian methods of working were brought to their country; but Gaspar Baneiros in his *Chronographia*, published in 1562, says that the glass made at Barcelona was almost equal to that of Venice, and during this and the next century large quantities were exported. Venetian glass was imitated in several other places in Spain, and with considerable success, as several examples in the South Kensington Museum testify. The native forms and methods of working, however, went on contemporaneously, and it would appear do so down to the present day.

17th century. The branch of glass-making in which the greatest results were obtained in France during the 17th century was that of the manufacture of mirrors. In 1665 the services of eighteen Venetians were obtained, and a factory established in the Faubourg St. Antoine at Paris, and another factory was founded at Tour-la-Ville near Cherbourg. These were united and worked with great success; the plates which ornament the "Galerie des Glaces" at Versailles were made at Tour-la-Ville. In 1688 the process of casting plates of glass was first adopted in modern times (for the window glass of Roman times was cast); and thus it became possible to make mirrors of dimensions which could not be attained as long as the plates were produced by blowing. The manufacture was carried on at St. Gobain, still the seat of an immense production of glass.

English glass-making of the 17th century is distinguished by one of the most important innovations in the practice of the art which has at any time been introduced, that of using a large proportion of oxide of lead in combination with potash. Glass so made is more brilliant than other kinds, and is known in England as "flint glass," in France as "cristal." The employment of lead as one of the ingredients of glass was not a discovery, for it had been practised to a small extent and for certain purposes, as in the imitation of gems by the Romans, and through the Middle Ages. Neither the date when flint glass was first made nor the inventor of the process is known.

Sir William Slingsby before 1611 (*Cal. State Papers*, Dom.) had obtained a patent for making glass with sea coal; and in 1615 the use of wood for that purpose was forbidden by royal proclamation. How far this proclamation may have been obeyed does not appear, but Sir R. Mansel, who held a patent of monopoly for glass-making from 1616 until about 1634 (and perhaps even later), states in 1623 that furnaces erected in London, the isle of Purbeck, Milford Haven, and on the Trent, had all failed, but that he had established them successfully at Newcastle-on-Tyne. Probably coal was used at this last place, and it seems not unlikely that flint glass may have been first made there. Merret, however, writing about 1665 (in his edition of the *Ars Vitraria* of Neri), says that glass made with lead was not in use in the English glass-houses on account of its too great fragility; but in 1673 Evelyn notes in his diary a visit to the Italian glass-houses at Greenwich "where glass was blown of finer metal than that of Murano," and in 1677 a visit to the duke of Buckingham's glass-works (at Lambeth), "where they made huge vases of metal as clear, ponderous, and thick as crystal, also looking-glasses far larger and better than any that come from Venice." From this time much glass was made in England, and Dr. Pococke, who travelled in Germany in 1736, gives the preference in point of quality to English glass over Bohemian.

During this century much art and labor were employed in Germany in the ornamentation of vessels for drinking, such as goblets and wiederkoms. Sometimes they were painted in grisaille, the subjects being battles, processions, and the like, sometimes engraved or etched; common subjects are escutcheons with arms, views of cities, ciphers, etc. Many excellent artists worked in these various styles (Beckmann, *Hist. of Inventions*, iii. 209; Doppelmayr, *Nürnbergische Künstler*, p. 231, 233, etc.), and their works brought high prices. Dr. Pococke mentions seeing some at Rispen, to which the glass-works formerly carried on at Potsdam had been removed, which cost from £100 to £150. Excellent material for these artistic efforts was furnished by the Bohemian furnaces; the art was patronized by several German princes; the celebrated Kunkel was, in 1679, director of the glass-houses at Potsdam, which were carried on at the cost of the elector, and where the beautiful ruby glass was produced. Etching and engraving on glass was also much practised in Holland.

In Spain glass was made in 1680, at San Martin de Valdeiglesias, in imitation of Venetian; and Barcelona, Valdemaquada, and Villafranca are named in a royal schedule of the same date, fixing the prices at which glass was to be sold in Madrid, as places where wares imitative of Venetian were made. There was also an important manufactory at La Granja (see Introduction to *Cat. of Spanish Glass in South Kensington Museum*, by Señor Riano). Some of the products of the Spanish furnaces closely resemble those of Murano, but rarely exhibit much beauty or much originality. Others again, attributed to the factory of San Ildefonso and to the 18th century, bear a very close resemblance to some of the Dutch glass of that period.

18th and 19th centuries. Although during the 18th and earlier part of the 19th century progress was made both in the purity and in the beauty of the material (especially in the case of glass for optical purposes), and in the organization and working of factories, it was a period marked in no country by much of novelty or of artistic effort in the manufacture of glass. M. Labarte even goes so far as to say (*Hist. des Arts Industriels*, iv. 597) that in France in 1759 the fabrication of "vases de verre" had so completely fallen into decadence that the Academy of Sciences offered a prize for an essay on the means by which the industry could be revived. In the beginning of the present century cut glass was much in vogue, and was produced in England of great brilliancy, though the forms of the objects often left much to be desired in point of elegance.

The manufacture of colored glass for windows was a consequence of the revival of Pointed architecture, and England, France, Belgium, and Germany have in this century rivalled each other in its production.

The Exhibition of 1851 did not perhaps produce a more marked effect on any of the industrial arts than on that of glass. The progress made since that date in the fabrication of artistic glass wares (the verrerie de luxe of the French) has been surprising, and at the present moment enlightened and enterprising manufacturers of glass are in every country studying the products of the furnaces of all times and all countries, as their predecessors at Murano in that great period of the art—that of the Renaissance—did the relics of Roman glass-working (Biringuccio, *Pirotechnia*, lib. ii.) in order to glean from them lessons and suggestions of further advance in their art. (A. NE.)

## The Manufacture of Glass.

Glass, in its ordinary signification, is a brittle, transparent compound produced by the fusion, at a very high temperature, of silica (silicic acid) with one or more basic substances, one of which, in all cases, must be an alkaline metal. But the silicates of sodium and potassium, whether separate or combined, being soluble in water, and also readily acted on by other agents, are not in themselves suitable for most of the purposes to which glass is ordinarily applied. When, however, to these silicates, or to either of them, a silicate of an alkaline earth is added, the resulting body is not sensibly affected by water or ordinary solvents; and it is the fused amorphous mass thereby obtained that alone is glass in the restricted technical sense. Thus the definition given by Dumas that glass is a silicate of at least two metals belonging to different groups, one of which must be an alkaline metal, strictly embraces and limits all varieties of ordinary glass. Boracic acid, a substance closely allied in chemical properties to silica, has a similar influence on the alkalies and alkaline earths, producing by their mutual fusion a transparent amorphous compound; and indeed, for certain special purposes, a glass in which borates to a certain extent supplant silicates is used for optical purposes. The substances, however, which form the essential basis of all varieties of common glass are (1) silica as the acid element; (2) soda or potash as the alkaline base; and (3) lime and oxide of lead as the alkaline earths. To the alkaline earths commercially employed there ought also to be added baryta and alumina, the former being used in the

place of lead, and the latter being a common ingredient in certain kinds of glass.

The following tabular statement shows the bodies capable of yielding transparent glass:—

| Acid. | Alkaline. | Earthy. | |
|---|---|---|---|
| | | Colorless. | Colored. |
| Silica.<br>Boracic acid. | Oxides of<br>Potassium.<br>Sodium. | Oxides of<br>Calcium.<br>Lead.<br>Barium.<br>Strontium.<br>Magnesium.<br>Aluminium.<br>Zinc.<br>Thallium. | Oxides of<br>Iron.<br>Manganese.<br>Copper.<br>Chromium.<br>Uranium.<br>Cobalt.<br>Gold. |

Various authorities who have investigated the constitution of glass have endeavored to establish a chemical formula for what they term normal glass. The results arrived at, however, by different investigators disagree among themselves; and the balance of opinion is in favor of the view that no such substance as normal glass exists, and that glass does not result from any definite chemical compounds, but is simply a mixture of silicates, with usually an excess of uncombined silica. The proportions in which the ingredients of glass are present, however, have not only a very great influence on the fusibility of the mass; but these conditions also very materially affect the qualities of the substance. In general the more nearly the proportion of silica approaches the amount necessary to form definite compounds with the basic ingredients, the better and the more stable is the quality of the glass. The conclusion of Otto Schott in his investigation of the constitution of glass, that the simplest formula for glass is represented by $\left.\begin{matrix} x\mathrm{Na_2O} \\ y\mathrm{CaO} \end{matrix}\right\} z\mathrm{SiO_2}$, may be accepted as a safe statement.

The phenomenon of devitrification, which is exhibited most readily by glass of inferior quality, has important bearings on the chemical constitution of glass, as well as on the working of the material. Devitrification is a change which may be induced in all varieties, but only with difficulty in the finer kinds of potash glass—either by slowly cooling the glass from the state of fusion, or by heating it in a mixture of sand and plaster of Paris till it softens, and then allowing it to cool by very slow degrees. Thereby it partly or entirely loses its transparent amorphous form, and by the formation of innumerable minute crystals it becomes opaque. When such a change penetrates the entire mass it assumes a milky and porcelain-like appearance, whence it is in this condition known as Réaumur's porcelain—the phenomenon having been first investigated by that observer. Devitrification renders the material much harder and less fusible than the same glass in a transparent condition; and it is less subject to fracture on the application of heat. According to Pelouze, Splittgerber, and others, devitrification results simply from a re-arrangement of the molecules into the crystalline form while the mass is soft, no alteration in the proportions of the constituents taking place concurrently; but Dumas and his followers maintain, on the contrary, that in undergoing the change the glass loses part of its alkali, and that crystallization takes place through the formation of compounds infusible at the temperature existing at the moment of crystallization. These compounds may result either from the dissipation of alkaline matter or from the separation of the mass into two strata,—that most highly alkaline retaining its amorphous condition more persistently than the other more siliceous portion.

The physical properties upon which the great value and utility of glass principally depend are (1) its well-known prevailing transparency combined with a brilliant lustre and great hardness; (2) its fusibility at a high temperature; and (3) its softness and viscosity at a red heat, whereby it can be moulded and otherwise worked with facility into any shape desired. Of great value also is its resistance to the influence of common solvents. Properly-made glass is not sensibly acted on by any of the acids except hydro-fluoric acid, which attacks it powerfully, combining with and removing its silica. Water affects glass so feebly that for practical purposes its action may be disregarded; but when it is submitted for a prolonged period to water at a high temperature, it is slowly dissolved. Even prolonged exposure to moist air so acts on glass, particularly on highly alkaline varieties, that the surface becomes clouded and obscure, and the beautiful iridescent scaling off observable in ancient glass is due to the exposure of the substance for long ages to the influence of moist air or damp earth.

Glass is an extremely bad conductor of heat, and from that property springs, in great measure, its brittleness. Owing to this imperfect conductivity it necessarily results that a mass of glass, or a glass object cooling from a state of fusion, becomes cooled and set or solidified on its outer surface before the internal molecules have parted with their heat, contracted, and established themselves in a stable relation to each other. The solidification of the superficial stratum thus necessarily hinders the contraction of the internal portion of the mass, and as the internal molecules cool down a state of tension is created, the central portion tending to draw the surface stratum inwards with a force held in check by the strain in the contrary direction of the outer range of molecules. In this condition a very moderate impact is sufficient to determine the fracture of the glass. The high degree of brittleness which results from unequal cooling is exhibited in a very marked manner by the philosophical toy known as "Rupert's drops." Such pear-shaped masses of glass are prepared by allowing molten glass to fall, drop by drop, into cold water, when the drops assume a more or less spheroidal form, with a finely tapering point. Of course a very sudden and rapid cooling of the surface takes place, while the interior is still at a high temperature, and correspondingly much dilated, the consequence of which is that a state of great tension is established between surface and centre. The breaking off of a small portion of the tail is sufficient to destroy the equilibrium established between the hard superficial and the dilate internal molecules; and immediately the whole mass is shattered to dust with explosive violence. Excessive brittleness is overcome by the operation of annealing to which glass is submitted,—a process which has been explained under ANNEALING, and which will be further referred to in dealing with a method of tempering or hardening glass which has been introduced by M. de la Bastie within the last few years.

It is difficult to give a consistent and systematic view of the manufacture of glass, because not only chemical constitution, but the mechanical operations by which glass is prepared, and the purposes to which the material is applied, have also to be taken into consideration. A good classification, from a chemical point of view, is that given by Stein (in Bolley's *Technologie*), who distinguishes three classes:

(1.) Glass containing one or two bases belonging to the same group. This class embraces only the soluble silicates which do not fulfil the ordinary functions of glass.

(2.) Glass with several bases which belong to different groups, comprehending two classes:—(1) calcium glass, under which come sodium-calcium glass and potassium-calcium glass; and (2) lead glass, which constitutes ordinary flint glass or crystal and strass.

(3.) Colored and opaque glass, of which there are also two classes,—the first embracing the varieties of transparent colored glass which may belong to any of the above classes, with the addition of coloring oxides, and the second being devoted to the various kinds of opaque glass.

The raw materials of the glass manufacture embraec the following principal ingredients. (1.) Silica is used in the forms of pure quartz (for very fine qualities of glass), crushed sandstone, pulverized flints, and especially sand of degrees of purity varying in proportion to the quality of the glass to be made. The finest iron-free sand in the United Kingdom is obtained from Alum Bay in the Isle of Wight, from Lynn, Norfolk, and from Leighton Buzzard, Bedfordshire; but much pure sand is imported into the United Kingdom from Fontainebleau in France, from Belgium, and other localities. (2.) Lime is employed in the form of chalk or marble, either burned or unslaked, and it also must for colorless glass be free from iron impurities. Of (3.) potash and (4.) soda, any of the ordinary salts except chlorides, but especially the sulphates and carbonates, are indifferently utilized, the point of real importance being here also the freedom of the compound from contamination when fine glass is being made. At no very remote date kelp was the principal source of soda alkali in glass, but this is now entirely disused, and the principal source of potash is the salt mines of Stassfurt and Leopoldshall in Prussia, and at Kalusz in

Galicia. Both potash and soda are frequently constituents of the same glass; but glass made from potash is free from the decided sea-green tinge which invariably is seen in soda glass, although the latter is the more brilliant in lustre. (5.) Lead is the characteristic ingredient of a distinct class of glass of which ordinary flint glass is the type. It is usually employed in the form of minium or red lead ($2PbO,PbO_2$), partly on account of its fine state of division and partly because by giving off oxygen it helps to purify the metal. (6.) Baryta and witherite or baric carbonate have been introduced with much success as a partial substitute for alkali in soda or potash glass, and for a part of the lead in ordinary flint glass, and in all probability barium compounds are destined to occupy a much more important place in glass manufactures than hitherto they have done. (7.) Cullet or waste and broken fragments of the special kinds of glass to be made is an important and essential ingredient, being added to the extent of about one-third of the whole charge in the melting and preparation of glass. These materials constitute the essential ingredients which go to the formation of glass. In coarse varieties, such as bottle glass, alumina and iron are present, but their presence simply results from the inferior and impure nature of the raw materials employed, and are neither essential nor desirable. Some portion of alumina too, is taken up from the pots in which the materials are melted. Bleaching or oxidizing agents are also employed to produce a high degree of colorlessness in clear glass, and for this purpose peroxide of manganese, arsenious acid, and nitrate of potash are the materials generally used. These bodies oxidize carbon compounds which may be present, and neutralize to a large extent the color yielded by iron by converting its protoxide into peroxide. Too much manganese, however, gives the glass a reddish tinge, and excess of arsenic produces a milky cloudiness. The various substances employed to produce colored and opaque varieties of glass will be enumerated when these special kinds are described. The requisite proportions of the raw materials ground and prepared are intimately mixed with the aid of a mixing apparatus, and in this form constitute the "batch." Formerly it was the habit to frit or partially decompose and fuse the ingredients in a form of reverberatory furnace called a calcar arch, but since the use of kelp was abandoned that operation is no longer essential, and generally the well-mixed batch is placed at once in the melting pots, or the tank in the case of tank furnaces.

*Melting Pots.*—These pots or crucibles are made of the finest fire-clay, that from Stourbridge in Worcestershire being exclusively used for glass pots in Great Britain. Great care is requisite in the selection, and in cleansing the clay from extraneous particles, the presence of which, even in the smallest degree, will injure the pot. A fine powder procured by grinding old crucibles is generally mixed, in a proportion seldom larger than a fourth, with what is termed the virgin clay. This mixture dries more rapidly, contracts less while drying, and presents a firmer resistance to the action of the fire and alkali used in the composition of glass than the simple unmixed clay. These ingredients, having been mixed, are wrought into a paste in a large trough, and carried to the pot loft, covered in such a way as to exclude dust and other minute particles. Here a workman kneads the paste by trampling it with his naked feet, turning it from time to time until it becomes as tough as putty. It is then made into rolls, and wrought, layer upon layer, into a solid and compact body, every care being taken to keep it free of air cavities, which would, by their expansion in the furnace, cause an immediate rupture of the pots. After pots are made, very great care is necessary to bring them to the proper state of dryness before taking them to the annealing or pot arch. In drying they commonly shrink about 2 inches in the circumference. When pots are made during summer, the natural temperature is sufficient for drying them; but in winter they are kept in a temperature of from 60° to 70° Fahr. They remain in the room where they are made for a period varying from nine to twelve months. Being afterwards removed to another apartment, where the heat is from 80° to 90° Fahr., they are kept there for about four weeks. They are then removed for four or five days, more or less, according to their previous state of dryness, to the annealing arch, which is gradually and cautiously heated up till it reaches the temperature of the working furnace, whither, after being sufficiently annealed, they are carried as quickly as possible. Pots last upon an average from eight to ten weeks, and they form a costly item in the manufacturing operations, as each pot is worth on an average about £10; and many of them, notwithstanding all care, crack and give way as soon as they are placed in the melting furnace. For all varieties of glass, excepting lead glass, open pots in the form of a truncated cone, as represented in fig. 1, are employed; but for flint glass a covered pot with an opening at the side, as shown in fig. 2, is essential. Dr. Siemens proposed a form

Fig. 1.—Crown-Glass Pot.

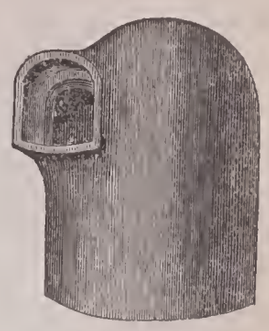


Fig. 2.—Flint-Glass Pot.

of melting pot divided into three compartments, the materials being melted in the first, and passing into the second by an opening at the lower part of the partition, where the metal was to be fined and freed from included air-bubbles, and afterwards to pass by a like opening to the third compartment, whence it was to be drawn for working. The specific gravity of the charge in the first compartment would rise in proportion as the materials melted and became homogeneous in structure. Therefore the metal would sink in proportion as it melted; and the best melted portions pass into the second compartment, in which, under the influence of the direct furnace heat, it would be cleared. There, similarly, the perfectly fined glass falling to the bottom would pass into the cooler working compartment, which is protected by a covering cap. Dr. Siemens's idea has been practically developed in his continuous tank referred to below.

*Furnaces.*—A glass-melting furnace or oven is a modified form of reverberatory furnace, which assumes many different shapes and arrangements according to the kind of glass to the manufacture of which it is devoted, and the nature of the fuel used. As regards the latter cause of difference it may be noted that, while coal is the principal fuel employed in Great Britain, dried wood and peat are extensively consumed in Germany, and in modern times gas furnaces on the Siemens and other principles are being freely introduced. In the construction of a furnace the principal objects to be kept in view are not only the production and maintenance of an intense heat, but its uniform distribution throughout the furnace, and the bringing of the charges of glass materials directly under its fusing influence. The form assumed by melting furnaces is, in general, square or oblong for sheet and plate-glass making, and circular in English flint-glass making. The fire-space or grate occupies the centre of the furnace, and the fire, when fuel is used for direct heating, is either fed or stoked from both ends, or raised from under the bars by a patented method. The fire-grate is usually on a level with the floor of the house in which it is erected, but under it is an arched subterranean passage forming the "cave" or ash-pit, both ends of which extend to the open air outside the glass-house. The fire-grate bars are placed in the top of this arched passage, which thus serves as a canal for the atmospheric air required to maintain combustion within the furnace; and for regulating the admission of air, and so controlling the heat, there are doors at both ends of the archway. In some cases two such arched passages at right angles to each other, and intersecting at the fire-bars, are constructed, so that either can be used according to the prevailing direction of the wind, etc. In general no flue or chimney is directly connected with the furnace, the only exit for the products of combustion being the working holes, and thus the heat is directed around and over each pot placed opposite a working hole in the furnace. Within the furnace, around the grate space in the case of circular furnaces, or on both sides of it in quadrangular furnaces, is a raised bank or narrow platform termed the "siege," on which the melting pots are placed. The number of pots arranged in a furnace vary from four

to ten, and each is reached, either for charging or for working off the prepared metal, by means of "working holes" in the side of the furnace situated directly over the pots. The general form and construction of a six-pot crown-glass furnace, which also may be taken as the type of sheet and plate-glass furnaces, is shown in Plate V., where fig. 3 is a ground plan at the level of the siege of a common form of furnace, while in fig. 1 is seen a front

Plate V.

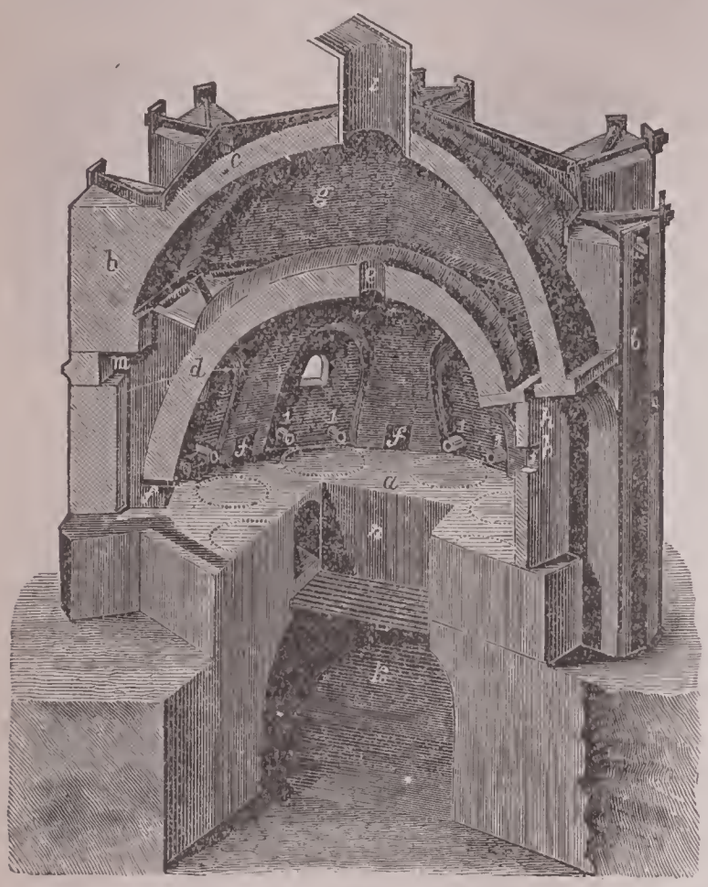

Fig. 3.—Section of Flint-Glass Furnace.

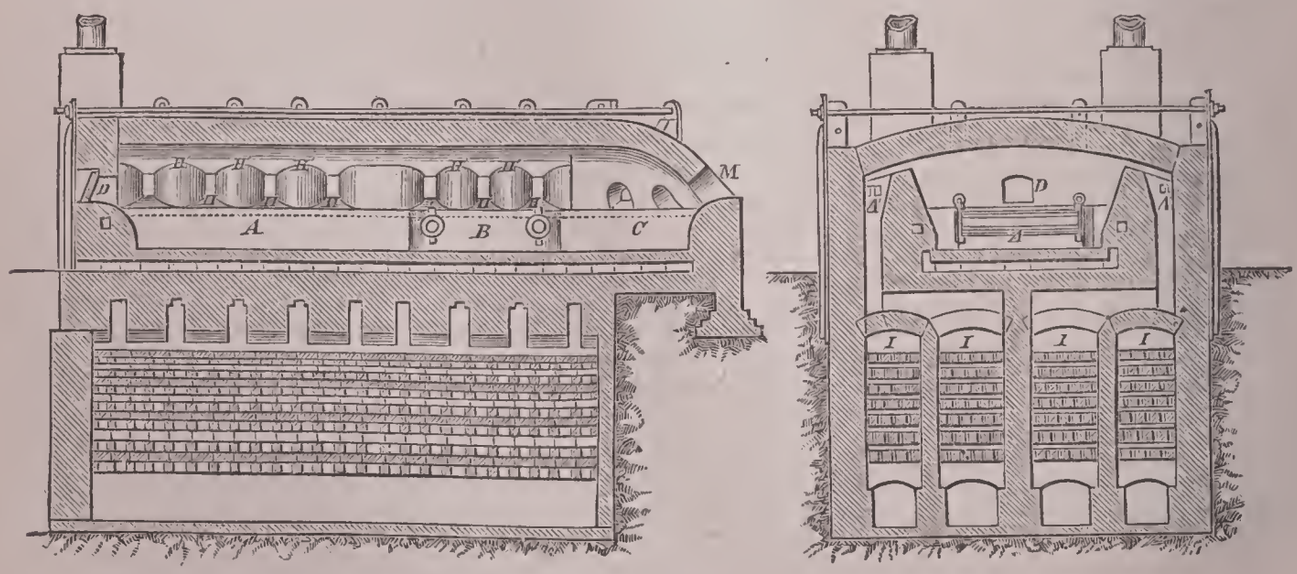
elevation of the same furnace, 1, 2, and 3 being the working holes, 4, 5, 6, and 7 pipe-holes for heating the blowing pipes, and 8, 9, and 10 foot-holes for mending the pots and sieges. The furnace is covered with a low-roofed crown or dome, and the whole structure is bound together with a system of iron bars. The materials used in the construction and lining of all furnaces must be selected with the utmost care, and built with special regard to the enormous temperature to which they are subjected. Formerly a fine-grained purely siliceous sandstone was much used, but now the principal materials are large moulded bricks or blocks of fire-clay of the most infusible and refractory description. For the crown of the furnaces used in plate-glass melting, Dinas silica blocks are employed. In laying the blocks and throwing the arches no mixture containing lime can be used, but only fire-clay or Dinas sand, in as small quantity as possible. Should any of the materials of the crown of the furnace gradually fuse under the influence of the heat, the dropping of the molten matter into the glass-pots is the cause of most serious annoyance and loss to the manufacturer.

An English flint-glass furnace furnishes the type of circular furnaces. Usually a large number of pots, sometimes ten, are provided for in such a furnace, because, the objects made in flint-glass being in general of small size, the metal is worked off only slowly, and a large number of glass-blowers can be accommodated at the separate work-holes. The arrangements of the cave and fire-grate are the same as in the case of square or oblong furnaces, but flint-glass furnaces differ from the prevailing rule in others by being provided with a system of flues and chimneys, one flue being placed between each pair of pots. The general appearance presented within a flint-glass house is illustrated in Plate VI. fig. 1; and the accompanying wood-cut (fig. 3) is a sectional illustration showing the construction and internal appearance of a seven-pot furnace. The furnace is composed of a double arch or vault springing from strong pillars or abutments *bb*. The space *c*, between the outer arch and the vault proper of the furnace *d*, is a common receptacle for the flues *ff* led from within the furnace, and the products of combustion escape by the chimney *i*. The work-holes are at *h*, and at that place the furnace wall is taken down when a pot requires to be removed and renewed. The "cave" or air canal is seen at *k*; *n* is the fire-grate, stoked in this case from one side only; *l* shows openings at which the blowing tubes are heated; *m* is an opening for cleaning the flues; and *a* is the bank or siege with the position of the pots indicated. Frequently instead of being arched the outer portion of the furnace is carried up in the form of a wide truncated cone or open chimney stalk, and in other cases short separate chimney stalks are built for each flue terminating within the glass-house, which itself forms such an open-topped cone or chimney. Of course in cases where such separate small chimneys are provided no second or outer vault is required.

Plate VI.

In the year 1861 Dr. C. W. Siemens introduced a form



Figs. 4 and 5.—Siemens's Continuous Tank Furnace.

of furnace in which the use of melting pots was altogether abandoned, and the batch was introduced into, melted in, and worked from a tank which occupied the whole bed of the furnace. This furnace he heated from the sides by means of his well-known regenerative gas system, described under Furnace and Iron. In 1872 he effected a further development of the tank furnace by dividing the tank, on the principle of his melting pot, by means of two floating bridges or partitions into three compartments, and thus he elaborated what is termed Siemens's patent continuous melting furnace. Of this improved furnace fig 4. shows a longitudinal section, and fig. 5 is a transverse section. A is the melting compartment, B the refining compartment, and C the working-out compartment. The

compartment A is fed with raw material (or batch) through the door D at the back end of the furnace; it is separated from the compartment B by the floating bridge E, under which the partially melted glass passes to reach the latter. In the compartment B the metal, by the influence of the higher temperature maintained on its surface, is completely purified, and sinks to flow under the bridge F in a complete workable condition. Suitable provision is made, by means of air-passages, to keep the sides of the tank of the requisite temperature to prevent any egress of glass through them, and the floating bridges E and F are renewed as often as necessary. The regenerative gas furnace is employed, and the gas and air ports H H′, leading from the regenerators I I′ respectively, are arranged along each side of the tank, so as to cause the flames to play across the furnace. The temperature of the different parts is regulated according to the various stages of preparation of the glass in the several compartments, this regulation being effected by constructing the gas and air ports of larger dimensions, or increasing their number, where the greatest heat is required; it is also facilitated by means of division walls (not shown in the figures) which may be built over the floating bridges to separate the compartments. The temperature of the working-out compartment C is controlled by regulating the draught of the furnace chimney, by diminishing which more or less flame must necessarily pass from B over the floating bridge F into C, and through the working holes M. The principal advantages resulting from the use of the continuous melting furnace are the following:—

1. An increased power of production, as the full melting heat may be employed without interruption, whilst with the old method of melting nearly half time is lost by cooling and settling the metal, the working it out, and the re-heating of the furnace.
2. An economy in working, as only half the number of men are required for the melting operations.
3. A greater durability of the tank and furnace, owing to the uniform temperature to which they are subjected.
4. A much greater regularity of working, and more uniform quality of the product than in other furnaces.
5. For the manufacture of window glass, the compartment C may be so arranged that the blowers can work without interfering with the gatherers; this would do away with the separate blowing furnace now in use.

Although the Siemens regenerative gas firing is generally used with tank furnaces, that system is not essential to the successful working of tanks. Mr. Archibald Stevenson of Glasgow has patented a tank furnace fired by common coal from one end, with working holes on the other three sides, and furnaces on this principle are worked in a perfectly satisfactory manner with much economy of coal and working room. Tank furnaces are used principally in bottle works and in the manufacture of rolled plate. The following statement shows the extent to which Siemens furnaces and tanks have been introduced by manufacturers.

Formerly it was the habit that to the sides or wings of the main melting furnace there were attached calcar or fritting arches, annealing ovens, pot-firing arches, and other subsidiary furnaces required in certain stages of glass manufacture. These were heated by flues leading from the fire-space of the principal furnace; but such a practice is now generally abandoned, and distinct furnaces or ovens, arranged and fired according to the necessities of the case, are provided instead. In the manufacture of common bottle glass, however, for which highly impure materials are used, it is still the practice to prepare a frit in a side arch occasionally attached to the melting furnace.

The whole of the pots in a common furnace are charged or filled with the prepared "batch" at the same time. Immediately the heat is forced, and the stoking must thereafter be carefully regulated to maintain the high temperature. As the mass begins to fuse it settles down and occupies considerably less space in the pot, to which thereon a second quantity of material is added, and generally a third portion is subsequently filled in so as to have at the close of the melting process as large a quantity of metal as possible. When the fusion is complete a scum composed of uncombined salts, and known as glass-gall or sandiver, rises and collects on the surface. It consists almost entirely of sulphate of soda, with sulphate of lime, and a small percentage of chloride of sodium. This scum of glass-gall is carefully removed with a perforated scoop, and the heat of the furnace is then forced to the most intense degree with the view of rendering the metal as fluid and limpid as possible, so as to free it from all included gaseous bubbles which it still contains. This process of "fining," "refining," or hot-stoking, as it is indifferently termed, involves a temperature which is estimated in certain cases to reach from 10,000° to 12,000° Fahr.; and the operation is sometimes assisted by stirring the molten mass with a pole of wood, in a manner analogous to the poling of copper in the refining of that metal. Throughout the operation of melting, test pieces are periodically withdrawn from the pots for the purpose of observing the progress and condition of the glass. When it is found that the vitrification is complete and the object of refining fully accomplished, the heat of the furnace is considerably reduced, so that the glass may be brought into that condition of viscosity in which it is capable of being worked. In contradistinction to the refining or hot-stoking period, this is known as cold-stoking.

*Glass Working.*—The means by which melted glass is caused to assume its varied forms for use are (1) by blowing; (2) by casting; and (3) by pressing in moulds—an operation in which the other two processes may be partly combined. Minor manipulative processes which do not fall under any of these heads are called into action; but these are for the most part merely subsidiary to the others, which really comprehend all the lines along which the formation of glass proceeds.

Having regard principally to the forms into which glass is worked and the uses to which it may be applied, the following classification embraces the principal departments of the glass-making industry.

I. Flat glass.
   - Crown glass.
   - Sheet glass.
   - Plate glass.

II. Hollow glass.
   - Flint glass, blown.
   - Bohemian glass.
   - Venetian glass.
   - Bottle glass.
   - Slag glass (Britten's).
   - Tube and gauge glass.

III. Pressed and massive glass.
   - Flint glass.
   - Optical glass.
   - Strass.
   - Rod glass, marbles, and beads.

IV. Colored, opaque, and enamel glass, including glass mosaics and hot cast porcelain, etc.

So far as they involve distinct manufacturing processes, these varieties of glass will be here noticed in the above order. Such of the divisions as result from the application of special methods of ornamentation, and as come under the head of art glass, do not fall within the scope of this article.

Crown Glass.—This, with sheet or cylinder glass, forms all ordinary blown window glass. Both varieties are precisely the same in composition, being a mixture of sodic and calcic silicates, and differ only in the manner in which the sheets of finished glass are produced. The raw materials employed for this and all other kinds of glass vary within rather wide limits, and, as already explained, the form in which the sodic and calcic compounds are used may also be varied. The following composition of batch for window glass must therefore be regarded as only one out of very many mixtures in use:—

| | | |
|---|---|---|
| Sand, purified | | 100 parts. |
| Chalk or limestone | 35 to 40 | „ |
| Sulphate of soda | 40 to 45 | „ |
| Cullet | 50 to 150 | „ |

To these materials a minute proportion of white arsenic and peroxide of manganese, as bleaching agents, may also be added

Crown glass was, in the early part of the present century, the only form of window glass made in Great Britain, and consequently it was generally recognized as English window glass, having been manufactured only on a very limited scale in any other country. Since the introduction of sheet-glass making, the crown-glass industry has steadily declined, and now its manufacture may be regarded as practically a thing of the past, not more than one or two crown furnaces being in operation. Seeing that it possesses little more than an historical interest, it is now unnecessary to enter into much detail as to the processes employed in the manufacture of crown glass.

The metal being brought to a proper condition for working, the "gatherer" dips into the pot of metal an iron pipe or tube, 6 or 7 feet in length, of the shape shown in fig. 6, heated at that end which takes up the glass, and, by turning it gently round, gathers about 1½ lb of liquid glass on the end of it. Having

Fig. 6.—Blowing Tube.

allowed this to cool for a little, he again dips the rod into the pot and gathers an additional quantity of from 2½ to 3 lb. This is also permitted to cool as before, when the operation of dipping is again repeated, and a sufficient quantity of metal, from 9 to 10 lb weight, is "gathered," to form what is technically called a table or sheet of glass. The rod, thus loaded, is held for a few seconds in a perpendicular position, that the metal may distribute itself equally on all sides, and that it may, by its own weight, be lengthened out beyond the rod. The operator then moulds the metal into a regular form, by rolling it on a smooth iron plate, called the "marver," a term corrupted from the French word *marbre*. He then blows strongly through the tube, and thus causes the red-hot mass of glass to swell out into a hollow pear-shaped vessel. The tube with the elongated sphere of glass at the end of it is then handed to the "blower," who heats it a second and third time at the furnace, pressing the end, between each blowing, against the bullion bar, so called from the part thus pressed forming the centre of the sheet or "bull's eye," and by the dexterous management of this operation, the glass is brought into a somewhat spherical form. The blower now heats a third time at the "bottoming hole," and blows the metal into a full-sized flattened spheroid. When this part of the process has been completed, and the glass has been allowed to cool a little, it is rested on the "casher box," and an iron rod, called a "pontil" or punty rod, on which a little hot metal has been previously gathered, is applied to the flattened side, exactly opposite the tube, which is detached by touching it with a piece of iron, dipped beforehand in cold water, leaving a circular hole in the glass of about 2 inches diameter. Taking hold of the punty rod, the workman presents the glass to another part of the furnace called the "noso hole," where the aperture made by its separation from the tube is now presented and kept until it has become sufficiently ductile to fit it for the operation of the flashing furnace. Whilst here, it is turned dexterously round, slowly at first, and afterwards with increasing rapidity; and the glass yielding to the centrifugal force, the aperture just mentioned becomes enlarged. The workman, taking great care to preserve, by a regular motion, the circular figure of the glass, proceeds to whirl it round with increasing velocity, until the aperture suddenly flies open with a loud ruffling noise, which has been aptly compared to the unfurling of a flag in a strong breeze; and the glass becomes a circular plane or sheet, of 4½ feet diameter, of equal thickness throughout, except at the point called the bullion or bull's eye, where it is attached to the iron rod. The sheet of glass, now fully expanded, is moved round with a moderate velocity until it is sufficiently cool to retain its form. It is carried to the mouth of the kiln or annealing arch, where it is rested on a bed of sand and detached from the punty rod by a shears. The sheet or table is then lifted on a wide-pronged fork, called a faucet, and put into the arch to be tempered, where it is ranged with many others set up edge-wise, and supported by iron frames to prevent their bending. From 400 to 600 tables are placed in one kiln. A sketch of the interior of a crown-glass house, during the progress of these operations, has been given in Plate VI., fig. 2. The kiln having been clayed up, the fire is permitted to die out, and the heat diminished as gradually as possible. When the glass is properly annealed, and sufficiently cold to admit of its being handled, it is withdrawn from the oven after the removal of the wall built into the front of the arch, and is then quite ready for use. The largest-sized tables of crown glass made will cut into slabs 30 inches across, from which squared pieces measuring 38 by 24 or 35 by 25 inches may be obtained.

Sheet Glass, as already mentioned, is the same in composition as crown glass, which it has now entirely supplanted. The success of sheet glass is due principally to the fact that it can be produced in sheets of much greater dimensions than is possible in the case of crown glass: it is free from the sharp distorting striæ and waves common in crown glass; there is no loss of glass as there is with the bull's eye of crown; and modern improvements effected in the manufacturing process leave little distinction in brilliancy of surface between the two qualities. Sheet glass is made on the greatest scale in Austria, Germany, and Belgium, and it was long distinguished in the British market as German sheet glass. In 1832, Chance of Birmingham and subsequently Hartley & Co. of Sunderland introduced the manufacture into England, and in the hands of these firms, as well as of others who followed in their footsteps, the industry prospered and developed, till it has now attained dimensions equal to those it has reached in most of the Continental nations, where the art was long established before it came into use in England.

Sheet-glass making involves two principal operations,—(1) the blowing of the cylinder, and (2) the opening, flattening, or spreading of the glass. The structure and internal arrangements of the melting furnace is practically the same as in the case of crown glass. The ordinary type of oblong furnace usually contains 10 pots—5 in each side of the fire-grate—each pot being of a capacity of about 1 ton or 22 cwt. of metal. Radiating from the work-holes, and raised about 7 feet above the floor level, or a correspondingly deep sunk pit, are ten long stages with an open space between each sufficient to allow the workman to swing about his long tube freely in forming the elongated cylinder of glass. Fig. 7 is a ground plan of a common sheet-glass

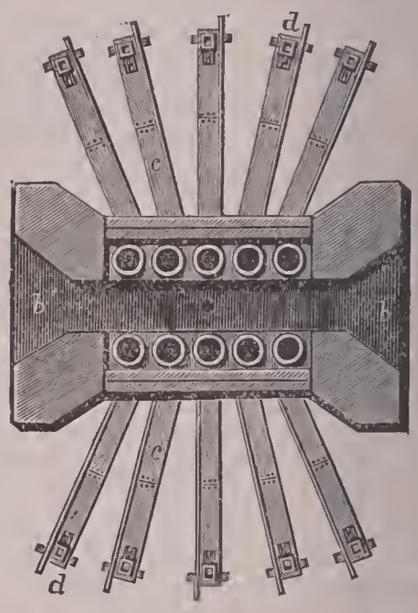

Fig. 7.—Plan of Sheet-Glass Furnace.

furnace and staging of planks *c*, at the extremities *d* of which are placed a tub of water and a wooden moulding-block. Instead, however, of having these stages erected in front of the melting furnace, it is now a common practice to gather and block the glass at the melting furnace, and to blow it in front of a seperate oblong reheating or blowing furnace, from each opening of which the wooden stage runs out over a pit excavated to the depth of 7 feet or thereby. Common bricks may be used for the construction of this reheating furnace, as the heat required in it is by no means intense.

*Blowing.*—The charge or batch requires about 16 hours to melt, and other 8 hours are consumed in cooling it to the working consistency. When the metal is ready for working, the workmen take their stations, each having his own pot and stage and also an assistant, and commence making the cylinders. After gathering the quantity of metal required (which on an average amounts to 20 lb), the workman places it in a horizontal position in the large hollow of a wooden block (fig. 8), which has been hollowed so that, when the workman turns the metal, it shall form it into a solid cylindrical mass. In the meantime, the assistant, with a sponge in his hand, and a bucket of water by his side, lets a fine stream of water run into the block, which keeps the wood from burning, and also gives a brilliancy to the surface of the glass. The water, the moment it comes in contact with the glass, is raised to the boiling point, and in that state does no injury to the metal; but it is only when the metal is at a high temperature that such is the case; for, whenever the glass is cooled to a certain degree, it immediately cracks upon coming in contact with water. When the workman perceives that the mass of metal is sufficiently formed and cooled (fig. 9), he raises the pipe to his mouth at an angle of about 75 degrees, and commences blowing it, at the same time continuing to turn it in the wood block, till he perceives the diameter to be of the requisite dimensions (fig. 10), which are usually from 11 to 16 inches. The workman then reheats this cylindrical mass, and, when it is sufficiently softened, commences swinging it over his head, continuing to reheat and swing till he has made it the desired length, which is commonly about 45 inches. It is now

a cylinder of say 45 inches long by 12 inches in diameter, one end being closed, and the other having the pipe attached to it. The workman begins to open the end which is closed, for which purpose he encloses the air in the cylinder, by stopping the

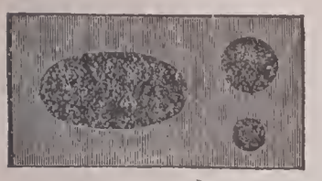

Fig. 8.

Fig. 9.

Fig. 10.

aperture of the pipe with his finger; and then placing the close end of the cylinder towards the fire, it becomes softened, while at the same time the air within is expanding, and, in about thirty seconds, the softened glass at the extremity of the cylinder gives way, forming an aperture as in fig. 12. The workman then turns the cylinder round very quickly, and, by keeping the opened extremity warm at the same time flashes it out perfectly straight as at *g*, fig. 13. If the burst edges are ragged in appearance they are trimmed by cutting with a pair of

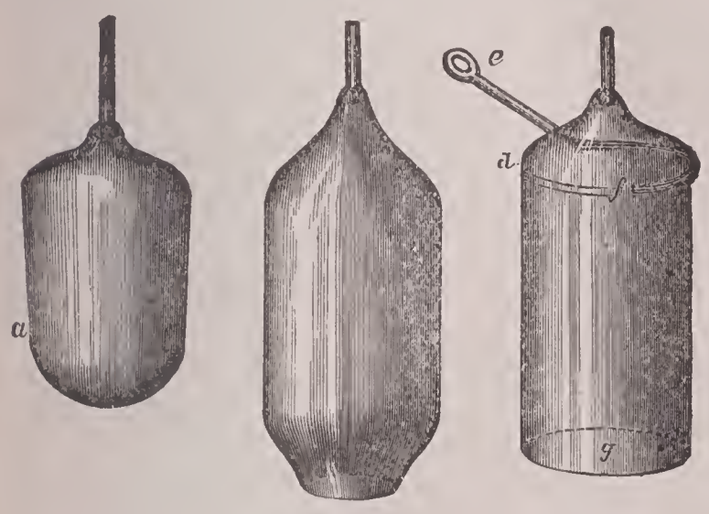

Fig. 11. Fig. 12. Fig. 13.

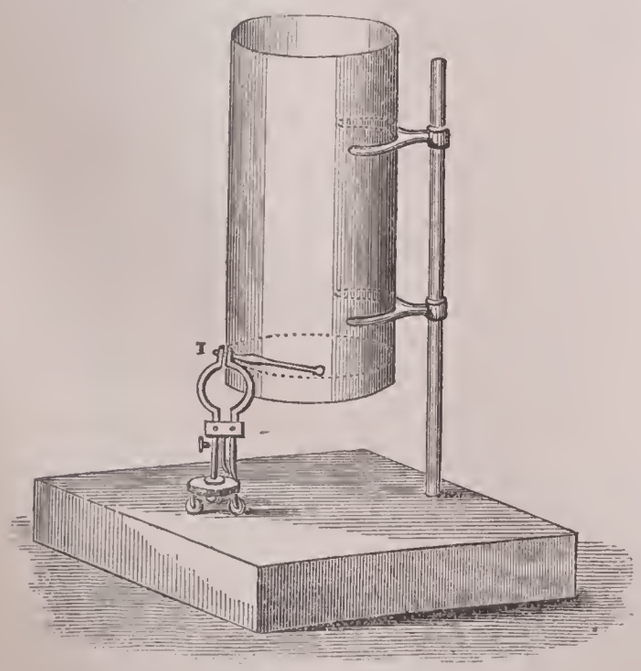

Fig. 14.

scissors before finally expanding. The bursting of the end of a thick heavy cylinder has to be determined by allowing a glowing drop of glass to fall on the spot to be burst before presenting it to the fire. The other end, which is attached to the pipe, has now to be cut off, and is done in the following manner. The workman, having gathered a small quantity of metal on the pontil, draws it out into a thread of about one-eighth of an inch in diameter, laps it round the pipe end of the cylinder, and, after letting it remain there for about five seconds, withdraws it suddenly, and immediately applies a cold iron to the heated part, which occasions such a sudden contraction, that it cracks off where the hot string of glass has been placed round it. Another method is to draw a semi-cylindrical rod of iron *e* (fig. 13) heated to redness around the line *d* of desired fracture, and a drop of water then allowed to fall on the line so drawn determines its fracture. The stages in the development of a cylinder to its full length are illustrated in figs. 9 to 13.

*Flattening.*—The cylinder so blown and detached is now allowed to cool; and, previous to its flattening, the burst extremity being thinner than the remainder, and slightly contracted at its edge, has to be removed to the depth of about two inches. For this purpose the cylinder is placed vertically in the jaws of a cutting instrument, having a diamond cutter, pressing by a spring, inside the glass (fig. 14). The cutter moves by small wheels on the table on which it is placed, and being pushed around the cylinder it makes an accurate cut of uniform height. The cylinder has then to be split longitudinally to allow it to be opened out to a flat sheet. To accomplish this the practice was formerly to lay the cylinder horizontally on a bench, and draw a red-hot iron two or three times along the inner surface at the line of desired fracture. Now the splitting is done with a diamond cutter fixed in the cleft of a stick, and (fig. 15) guided from end to end of the cylinder by a straight-edge K laid within it. The cylinder is now ready to be taken to the flattening kiln, which consists of two chambers built together, the one for flattening the cylinders, the other for annealing the sheets, the former being kept at a much higher temperature than the latter. The cylinder, after being gradually reheated, is placed in the centre of the flattening oven, upon a smooth stone, with the split side upwards. In a short time it becomes softened with the heat, and by its own weight falls out into a flat square sheet of 45 inches by 36. The flattener, with a piece of charred wood, rubs it quite smooth, and then places it on edge in the annealing arch, where it remains about three days to be annealed.

In the arrangement of the flattening and annealing ovens numerous improvements have been effected, which have resulted in greatly increased smoothness and uniformity of the glass, and in considerable economy of time and labor in the operation. Fig. 16 shows a section of a flattening (L) and annealing kiln (M) in common use. The split cylinder O is introduced and gradually pushed forward so as to be uniformly heated till it reaches P, the flattening stone, or table, mounted on a movable wagon N. On this wagon, after it has been flattened, it is carried into the annealing arch M, as shown by the dotted outline. Here in a less heat it gradually stiffens, till it is ready to be moved by a forked tool to a horizontal position on the bed of the annealing oven. The wagon then goes back to the flattening arch, and when it is reintroduced with another sheet, that previously flattened is ready to be piled up on edge at R, and thus the work proceeds till the annealing oven is filled, when it is closed up and allowed to cool down by slow degrees. Chance Brothers & Co. of Birmingham are the introducers of a system of continuous flattening and annealing furnaces. This they accomplish by means of two contiguous circular kilns having revolving soles, the fires being arranged and the inside partitioned so that the split cylinder gradually approaches the greatest heat, where the flattening takes place, and then passes round in a decreasing temperature till at the opening into the annealing arch it has attained sufficient consistency to be moved into the yet cooler annealing arch, round which the sheet is slowly carried till it arrives fully annealed at the point where it is withdrawn.

Although the average size of finished sheet glass as now made is about 50 inches by 36 inches, very much larger sizes may be and occasionally are produced, the extreme trade limit being 85 inches long by 49 broad; but both these extremes cannot be obtained in the same sheet, and few workmen attain the dexterity necessary for properly manipulating the larger sizes. In Belgium sheets from blown cylinders measuring 10 feet by 4 feet have been made. The thickness of finished sheet glass is estimated by the amount it weighs per square foot, and the commercial range of weight is from 15 oz. to 42 oz. per foot, the thicker and heavier kinds, of course, selling at the highest price.

*Polishing of Sheet Glass.*—Polished sheet glass is known in commerce as patent plate glass, to distinguish it from ordinary polished cast-plate. The practice of polishing sheet glass was first introduced and patented by Chance of Birmingham, and polished sheet is now in considerable demand for photographic purposes, for framing engravings, and generally where a fine true surface combined with lightness or thinness is requisite. The polishing process involves two operations—smoothing and finishing or polishing. The smoothing is done on a thick slab

of slate which must possess a surface as smooth and level as possible. This is covered with a piece of wet cotton cloth, and, the sheet of glass to be smoothed being laid thereon, by gentle pressure all air is expelled from between the surfaces, and the atmospheric pressure then keeps the glass firmly in position. The process of smoothing and the subsequent finishing are from this point the same as in the case of ordinary plate glass, under which head these operations will be detailed. It is only selected plates of fine clear metal that are used for polishing.

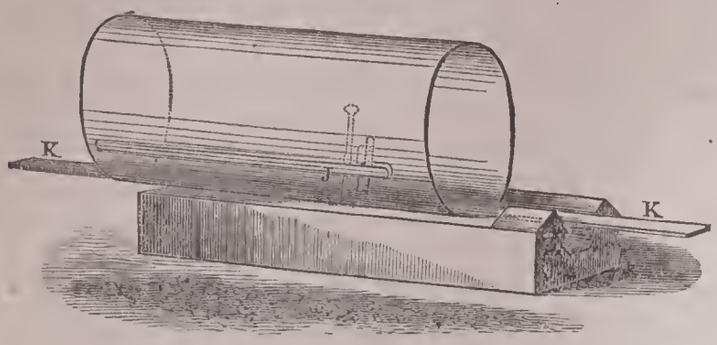

Fig. 15.

Plate Glass is manufactured by a process entirely different from any of those yet described, consisting as it does of glass cast and spread in sheets. As plate glass is invariably thicker than blown sheet, it is of the utmost consequence that the "metal" should be prepared from the purest possible materials, and that the founding or melting should be done with great care to ensure the expulsion of air bubbles. It is only thus that the fine clear homogeneous and flawless plates aimed at in the

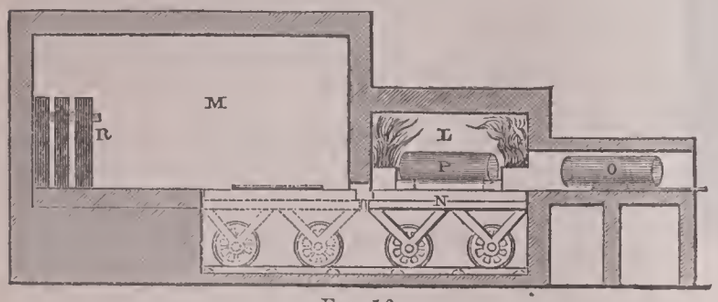

Fig. 16.

manufacture can be produced. Formerly the French excelled all other nations in the manufacture of plate glass, and the manufactures of the great St. Gobain Company yet command the highest prices in the market; but the increased care which has now for about a quarter of a century been given in England to the purity of materials, and the ingenious machinery which has been devised for polishing plate in England, have resulted in placing British-made plate glass on a level with the best productions of France.

The following is given as an example of the materials employed for the preparation of fine French plate:—

| | | |
|---|---|---|
| White quartzose sand | 100·0 | parts. |
| Sodic carbonate | 33·3 | " |
| Lime (slaked) | 14·3 | " |
| Manganese peroxide | 0·15 | " |
| Cullet | 100·0 | " |

The materials are melted in furnaces and pots of the ordinary construction, but in some cases the melting pots are of greater capacity, and contain charges of from 2 to 2½ tons. In French establishments, and in many others, two forms of pot are placed within the furnace—(1) the ordinary melting pot, and (2) a pouring pot or *cuvette*, quadrangular in form, made of the same material as the melting pot, and capable of holding sufficient metal for casting a single sheet of the superficial extent and thickness desired. Melting pots and cuvettes are placed side by side in the furnace, and the molten mixture is ladled with copper or malleable iron ladles from the pot into the cuvette, in which it is allowed to clear before casting. In some works, however, the molten glass is poured direct from the melting pots, and in other cases it is ladled to the casting table from the huge melting pots with large malleable iron ladles.

The casting table is a heavy, thick, flat table of cast-iron, of a length and breadth exceeding the size of the largest plate of glass which may be cast on it. At one end is placed a heavy cast-iron roller, the full breadth of the table, and fitted to roll the whole length of the table by means of spur wheels working into gearing along its sides. The cast-iron roller determines the thickness of the glass by the height at which it is caused to roll above the table, and that height is regulated by placing narrow strips or ribs of metal of the required thickness of the glass along the edges of the table on which the two extremities of the roller bear as it revolves. The breadth of the plate again is determined within the limits of the table by the two sides of the "gun," an apparatus consisting of two plates of cast-metal, placed in front of the roller, and bolted together by cross-bars at a distance apart which can be easily altered and adjusted according to the breadth of plate the apparatus is intended to control. The edge of the plates abutting against the roller are accurately fitted to the roller curvature, and thus they and the roller form three enclosing sides for the molten mass poured on the table, and as they travel forward they carry in front of them all the semi-fluid mass except the uniform layer which represents the distance between the moving surface of the roller and the surface of the casting table on which the glass is spread. As the glass does not instantly solidify the moment the roller has passed over and spread it into a sheet, the edges generally assume a rounded and somewhat wavy, cast-like appearance. Immediately the plate has sufficiently solidified to bear moving, it is taken to the annealing furnace, the heat of which has been carefully raised to the proper pitch. The sole of the annealing oven on which the plate is to rest (for with large plates any piling on edge is impracticable) must be as smooth and level as possible, since the still semi-plastic mass moulds itself to the surface on which it is laid. As the oven only accommodates a single plate of the largest dimensions, and since the annealing process occupies several days, a large number of ovens, occupying a great space and involving the expenditure of much labor and fuel, are needed in works where many plates are cast. In dealing with plates of small size they may be laid horizontally on the furnace bed for a little till they come to the furnace temperature, after which they are piled up on edge in twenties or thirties, leaning against a range of iron bars running across the furnace. When the plates have been deposited in the annealing oven, the openings are all carefully stopped up, and the furnace with its contents is cooled by slow degrees down to a temperature at which the glass may safely be withdrawn and exposed to ordinary atmospheric influences. The cooling of such furnaces is now hastened as far as the safety of the plates and the completion of the annealing will permit by allowing cold currents of air to pass under their sole.

The plates, as withdrawn from the annealing oven, have a very irregular, rough, undulating surface, and although the glass is perfectly pure, they have, owing to their uneven surface, no transparency. In this condition they constitute the "common rough plate" of commerce, and as such they are extensively used for the glazing of roofs, for floor and cellar lights, and generally in positions where light without transparency is requisite.

*Polishing.*—When the annealed plates are withdrawn from the oven they are carefully examined for any defects, such as spots, air-bells, etc., which they frequently exhibit. If serious defects are found, the plates are cut into the largest pieces which can be obtained free from flaws, and the selected pieces are then submitted to the operations of polishing, consisting of (1) grinding, (2) smoothing, and (3) polishing. Various forms of machine have been devised and introduced for effecting these

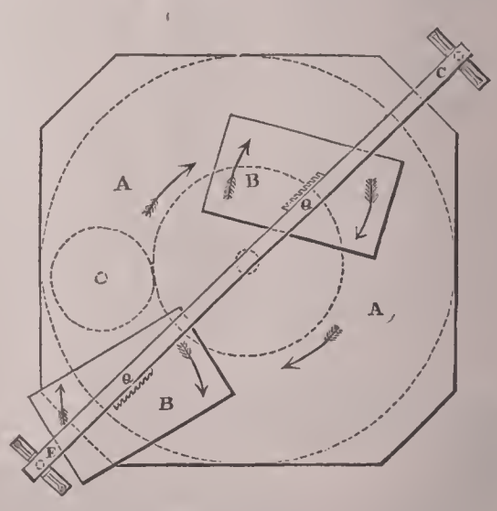

Fig. 17.—Plate-Glass Grinding Table.

operations. The grinding and smoothing table, invented by Mr. Daglish, of Ravenhead works, consists of a great revolving flat table A (fig. 17), with a strong fixed bar CE, stretched across it about 10 inches above its surface, to which two runner-frames, B, B, shod with iron, are pivoted at Q. The glass to be ground is cemented with plaster of Paris on the surface of the table, and the runner-frames rest on that surface. When the table A is set in motion, each oblong runner-frame B has communicated to it a revolving motion also, owing

to the excess of friction brought into action by the more rapid revolution of the outer edges of the revolving table. The effect of these compound revolutions is that every point of the surface of the glass is equally and uniformly abraded, when the apparatus in revolution is fed with sharp sand and water. When a level surface is thus prepared, the smoothing process is next begun on the same table, the only difference being that emery powder of increasing degrees of fineness is substituted for the sand, and, as the operation approaches completion, the utmost care must be exercised as to the purity and uniformity of the emery, seeing a single particle of grit would effectually destroy the smoothness of a whole plate. The quality of the emery is thus of essential consequence, and an ingenious apparatus is brought into use for arranging the sizes by means of a current of water of diminishing velocity, obtained by passing a uniform stream with agitation successively through cylinders or troughs of increasing size. In these troughs the emery powder is deposited in increasingly fine division, according to the growing capacity of the trough and the consequent slow replacement of its contents. The last touches of the smoothing process can only be given by the hand, which at once detects any appearance of grittiness. Both sides of the glass are in succession submitted to these operations, after which it is again bedded in plaster and fixed on the polishing table. The polishing is done with reciprocating rubbers, covered with fine felt, and supplied with rouge (peroxide of iron) in a liquid state. While a reciprocating motion is communicated to the rubbers, the table itself moves backward and forward in a transverse direction, so that all parts of the plate are equally brought under the polishing influence of the rubbers. About 40 per cent. of the weight of the rough plate is removed in the three polishing operations.

Ordinary finished plates vary in thickness from about ¼th to ⅜th inch, and the largest sizes measure about 17 feet by 9 feet 6 inches. The great St. Gobain Company of France quotes regular prices up to 324c. (10 feet 8 inches) by 204c. (6 feet 8 inches), beyond which size the price becomes special. In the Paris Exhibition of 1878 that company showed a silvered plate 24 feet by 14 feet, the largest piece of plate glass which has hitherto been polished.

*Rolled Plate.*—A form in which unpolished plate glass is extensively employed is the patent rolled plate, originally made by Hartley & Co. of Sunderland. The surface of the casting table on which the rolled plate is spread, instead of being smooth and plain, is engraved or otherwise indented with fine lines, grooves, or flutes, or it may be with small squares, lozenges, or even ornamental patterns, and the glass, of course, takes on its lower surface an accurate impression of any such pattern. Rolled plate is now very largely used for partitions, and in places where obscure lights are required. Such plates are always cast comparatively thin, and of moderate size, so that a large number may be piled in the annealing oven. They, as well as certain qualities of colored glass, are cast by ladling the molten metal from huge pots which may contain about 2½ tons of material. By this ladling numerous "air bells" are enclosed in the glass, but the circumstance does not affect the durability and usefulness of the glass.

Flint Glass or Crystal.—The name flint glass originated in the circumstance that at first the silica used in the manufacture of this variety of glass was in the form of ground flints. The industry belongs characteristically to the United Kingdom, where it was first established on a large scale, and to the present day flint glass is much more extensively manufactured in England than in any other country.

Flint glass is a compound entirely different from those above described, consisting as it does of a silicate of potassium and lead. As is the case with all kinds of glass, its composition and the proportion of ingredients used in its preparation vary widely. The average composition of a batch has been stated thus:—

| | |
|---|---|
| Fine white sand | 100 parts. |
| Minium (red lead) | 66 " |
| Refined potash | 33 " |
| Nitre | 10 " |
| Cullet | 60 to 100 " |

Small portions of bleaching ingredients, as white arsenic or manganese, are also sometimes added. Purity of materials is of the utmost consequence in the manufacture of flint glass, which is prized in proportion to the transparency, uniformity, sparkle, and freedom from color of the metal; and, as finished objects are in many cases massive, defects of color are very obvious. Flint glass is much more fusible than the kinds destitute of lead; it possesses great brilliancy owing to its high refractive and dispersive power, but being comparatively soft its surface is easily scratched and dulled. It is also slowly corroded by alkalies, and contact with solutions of sulphides blacken it. Its specific gravity varies according to the proportion of lead it contains; and, as the silicate of lead tends to sink when the glass is in the molten state, Faraday found glass from one melting to vary from 3·28 to 3·85, and in another instance from 3·81 to 4·75. The higher the specific gravity of the glass the greater is its refractive power and consequent brilliancy.

Flint glass is in no case used for architectural or structural purposes, but its purity and lustre peculiarly fit it for table glass, ornamental objects, glass globes and lustres, and for imitations of gems and precious stones. For the latter purpose a dense glass called strass, appropriately colored when necessary, is employed, and a glass of still greater density and refractive power is used for optical purposes. The softness of flint glass adapts it for engraving, cutting, and polishing; and these methods of ornamenting the finished glass are very much employed.

The special covered form of pot (fig. 2, *supra*) and the arrangement of the furnace have already been alluded to. Plate VI., fig. 1, represents the various arrangements, tools, and processes connected with a flint-glass house, the building in the centre being the large cone or chimney built over the furnace, which is seen through the arches *a*. At 5 and 6 men are seen at the working holes withdrawing metal from the pots on their long iron tubes; 7 is the marver on which the gathering is rolled till it acquires a circular shape; at 8 a blower is seen in process of expanding a gathering of glass by blowing; and at 9 a servitor or second man is attaching a post or lump of metal he has gathered on a pontil or punty to the end of a blown globe of glass. The two masses of glass are thus united together, and that attached to the hollow tube is separated by touching it, near to where the tube enters the globe, with a small piece of iron wetted with water. By this means the glass cracks, and a smart blow on the iron tube completes the disunion. The workman now takes the punty from his assistant, and laying it on his chair arm, rolls it backward and forward with his left arm, while with his right he moulds it into the various shapes required, by means of a very few simple instruments. By one of these, called a pucellas, the blades of which are attached by an elastic bow like a pair of sugar-tongs, the dimensions of the vessel can be enlarged or contracted at pleasure. Any superfluous matter is cut away by a pair of scissors. For smoothing and equalizing the sides of the vessel a piece of wood is used. After the article is finished it is detached from the punty and carried on a pronged stick to the annealing oven.

The annealing oven or leer for flint glass is a low arched furnace, generally of considerable length, with several openings at each end between which narrow lines of rails run. On these rails, small wagons, or trays mounted on four wheels, are placed, and the articles to be annealed are filled into such wagons. They are slowly pushed to the hottest part of the chamber, and passing that point they very gradually approach the cold end of the oven, from which they are withdrawn fully annealed. As each wagon is withdrawn at one end, another is entered at the other so that the line from end to end is kept constantly full. The ordinary method of gradually decreasing the temperature around the articles stationary in the leer is also practised.

*Flint-Glass Cutting, Engraving, and Etching.*—The sparkle and brilliancy of flint glass is developed by the process of grinding and polishing technically called glass-cutting. In fig. 18 is seen a representation of a glass-cutter's mill, *a* being the pulley and band communicating motion to the mill *b*, which is made of wrought or cast iron. Over it is suspended a wooden trough or cistern *c*, containing a mixture of sand and water, which is fed on the wheel as required for the operation of grinding. Smoothing is done on a wheel of fine sandstone to which water alone is applied, and for polishing, a wooden wheel supplied with emery, and finally with putty powder (oxide of tin), is employed. The trough *d* under the wheel receives the detritus of the grinding and other operations. The articles are held in the hand, and applied to the mill while rotating. The punty marks are ground off tumblers, wine-glasses, and the like, by boys holding them on small stone mills. Ground or obscured glass is made by rubbing the surface with sand and water. Iron tools fixed on a lathe and moistened with sand and water are used to rough out the stoppers and necks of bottles, which are completed by hand with emery and water. Engraving is the production of ornamental surfaces by a fine kind of grinding mostly done with copper discs revolving in a lathe. Etching is variously done by submitting the portions to be etched or bitten to the influence of hydrofluoric acid, the remainder of the glass being stopped off or protected by a coating of wax or some pitchy compound.[1]

Pressed Glass.—The most brilliant effect is produced by cutting, but moulding or pressing is much cheaper, and this branch of the art has now reached a high state of excellence. Glass formed by pressing in moulds, known distinctively as pressed glass, is peculiarly an English[2] industry, principally because it is only flint glass, or glass possessed of similar properties, that can with advantage be formed in that way. Although moulded glass has existed from early Roman times, it is only

[1] A large proportion of the obscuring of the commoner varieties of glass and of the obscured ornamentation on plate and sheet as well as on flint glass is now produced by means of Tilghman's sand blast described below

[2] [Invented in Massachusetts seven years before it was manufactured in England.—Am. Ed.]

within the present century that the modern industry has been developed, and of late years the trade has assumed important dimensions. A metal that melts at a comparatively moderate heat, and does not quickly pass from the plastic state, is essential for success in pressed glass making, because it has not only

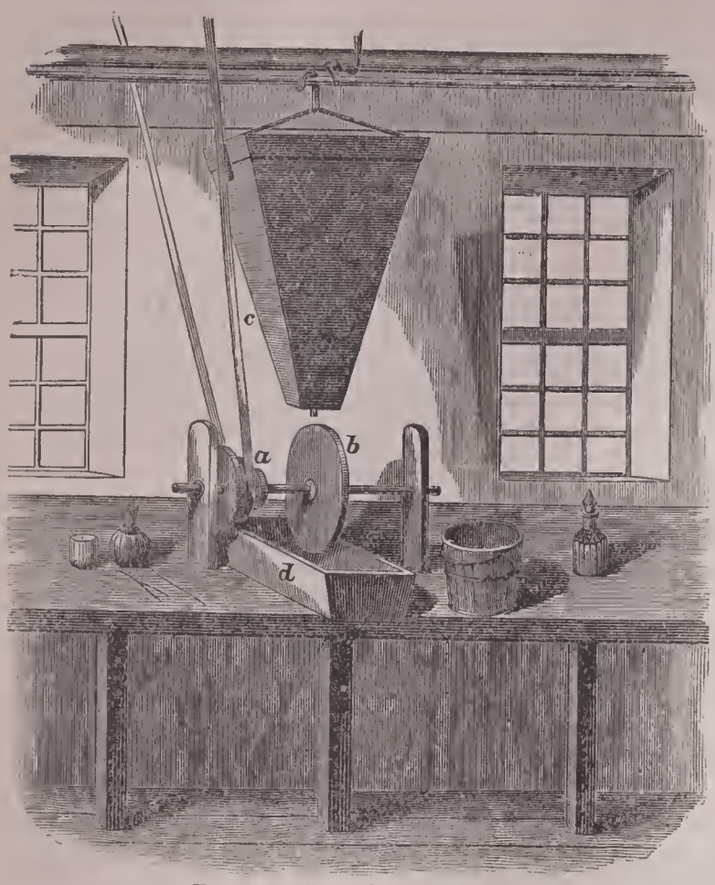

Fig. 18.—Glass-Cutter's Mill.

accurately to fill all the intricacies of the mould, but it must also be susceptible of fire-polishing. This operation consists of a reheating sufficient to melt a thin superficial stratum of the glass, whereby the roughness and obscurity of surface incidental to moulding is removed, and a smooth brilliant effect brought out, inferior only to the sparkling appearance produced by cutting. The moulds for pressed glass are made of iron or bronze; with great accuracy of surface; and they are, in use, kept a little under a red heat. The various segments of the mould are so hinged or connected as to close and leave internally a space representing the form and size of the article to be made, the internal hollow not being produced by blowing but by the plunger of the press under which the mould is placed. The required quantity of metal being dropped into the mould, the plunger descends and forces it into all parts of the cavity, completing immediately the formation of the article, which is then fire-polished by reheating, and afterwards annealed. In this way glass with elaborate facets, bosses, flutings, or other bold ornaments can be produced with rapidity and ease; and the only bar to great cheapness is the heavy cost of the lead and potash in flint glass. Several manufacturers both in England and on the Continent, where the pressed glass industry is extending, now partially supply the place of these costly materials by lime and baryta; and indeed English pressed glass of excellent quality is now in the market containing neither lead nor potash to any appreciable extent.

Baryta Glass.—The high price of red lead and various disadvantages connected with its use, have given rise to many efforts to find an efficient substitute for it in the manufacture of table and ornamental glass. Barium compounds, principally the native sulphate (common baryta or heavy spar) and the artificially prepared carbonate, have been more or less experimentally tried ever since 1830; but of late years the use of baryta has attracted much attention, and in several French and Belgian glass works it is understood to have taken its place as a raw material, without, however, much being publicly said regarding the subject. H. E. Benrath, the scientific director of the Lisette glass works near Dorpat has investigated the application of baryta in glass making with great fulness. Baryta, it appears, can be used as a partial substitute for the alkalies in glass-making; and indeed it was affirmed by Peligot that carbonate of baryta could altogether supplant either potash or soda, and yield a glass perfectly free of alkali. Such a glass is, however, shown by Benrath to be without practical value; but he has demonstrated that baryta may be used in the place of either lead or lime, to produce an easily fused dense glass much more brilliant than common glass, and in appearance and properties intermediate between that and flint glass. The qualities of the glass and its usefulness for various purposes can be modified by using both baryta and lime in varying proportions. There seems little doubt that baryta will occupy an important place in the future of the glass industry.

Bottle Glass.—This department of glass manufacture is of importance on account of its enormous extent; and although the raw materials employed in the trade are coarse and impure, and though the finished product has little appearance of excellence, the quality of the glass is in the highest degree important. Glass bottles, for example, are used for storing and preserving all manner of liquid substances for food, some of which undergo active chemical change, throughout a period of many years. In such a case it is of the highest consequence that the glass should be capable of resisting the solvent and corrosive action of acids and other substances which may be imprisoned or generated within the bottle, and such an object is attained by the high proportion of alumina which is found in bottle glass. Bottle glass varies in tint from the dark-green, almost black, semi-transparent claret bottles to clear and transparent qualities such as are employed for bottling aerated waters. The difference in color is partially due to the varying purity of the materials used, and partly to the action of bleaching or oxidizing agents. The materials ordinarily employed are common sand, gas-lime, brick-clay, common salt, and soap-boilers' waste; but local circumstances have much influence in determining the class of materials used. In Continental bottle works lava, basalt, and similar rocks of volcanic origin were formerly employed; and in Denmark and Sweden fluoride of calcium, left as a waste product of the manufacture of soda from cryolite, is used with marked advantage.

For bottle-making the tank furnace with or without compartments as already described is much used; but pot furnaces also continue in use. The arrangements of a common bottle house are seen in fig. 19, which is a ground-plan indicating a bilateral arrangement of a double bottle-house, with the complete plan of a four-pot furnace and ash arches. The furnace is oblong, similar to the crown furnace, but arched over in a barrel shape. It is erected in the centre of the brick cone, above a cave, which admits the atmosphere to the grating. The working holes of this furnace, opposite each pot, for putting in the materials and taking out the liquid glass, are each about 1 foot in diameter. At each angle of the furnace there is also a hole about the same size communicating with the calcining arch, and admitting the flame from the main furnace, which reverberates on and calcines the materials in the arch. In the figure, 1 shows the main furnace; 2, 3, 4, 5, the ash arches for calcining the materials; 6, 7, 8, 9, 10, 11, annealing arches; 12, two-pot arches; 14, clay-house for picking, grinding, sifting, and afterwards working the clay into paste for the purpose of manufacturing pots; 15,

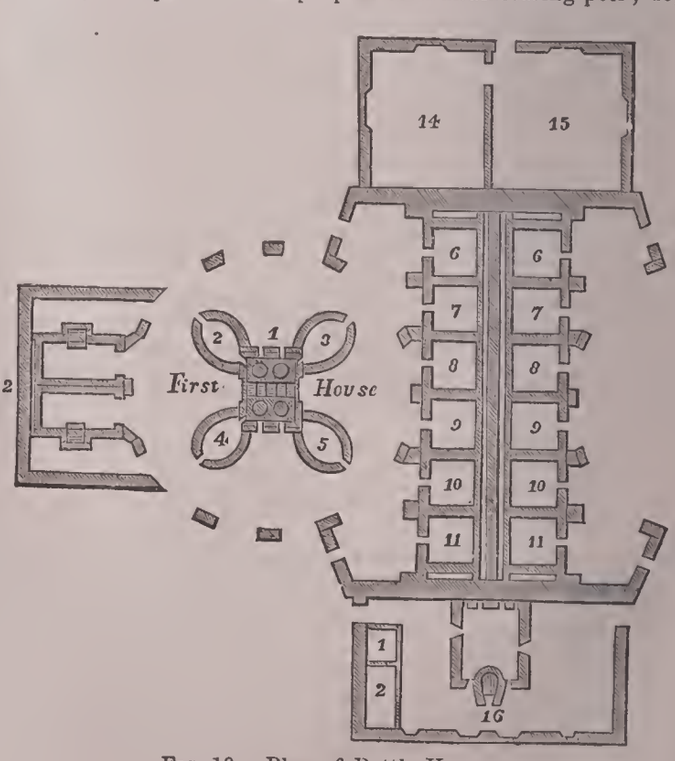

Fig. 19.—Plan of Bottle House.

mill house for grinding clay; 16, a building containing a calcar furnace for experiments, or for preparing the materials, when the ash arch attached to the main furnace is under repair, including 1, a sand crib, and 2, an ash crib for sifting and mixing the materials, sufficient for two houses.

*Fig. 1.* FLINT-GLASS MANUFACTORY

Drawn by W. Cooper, Edin.r *Fig. 2.* INTERIOR OF A CROWN-GLASS HOUSE. Engd by C. Adams

The following is an outline of the process of making a common bottle. After the metal has been skimmed, the person who begins the work is the gatherer, who, heating the pipe, gathers on it a small quantity of metal. After allowing this to cool a little, he again gathers such a quantity as he conceives to be sufficient to make a bottle. This is then handed to the blower, who, while blowing through the tube, rolls the metal upon a stone, at the same time forming the neck of the bottle. He then puts the metal into a brass or cast-iron mould of the shape of the bottle wanted, and, continuing to blow through the tube, brings it to the desired form. The patent mould now in use is made of brass, the inside finely polished, divided into two pieces, which the workman, by pressing a spring with his foot, opens and shuts at pleasure. The blower then hands it to the finisher, who touches the neck of the bottle with a small piece of iron dipped in water, which cuts it completely off from the pipe. He next attaches the punty, on which is a little metal gathered from the pot, to the bottom of the bottle, and thereby gives it the shape which it usually presents. This punty may be used for from 18 to 24 dozen of bottles. It is occasionally dipped into sand to prevent its adhering to the bottle. The finisher then warms the bottle at the furnace, and taking out a small quantity of metal on what is termed a ring iron, he turns it once round the mouth, forming the ring seen at the mouth of bottles. He then employs the shears to give shape to the neck. One of the blades of the shears has a piece of brass in the centre, tapered like a common cork, which forms the inside mouth; to the other blade is attached a piece of brass, used to form the ring. The bottle is then lifted by the neck on a fork by a boy, and carried to the annealing arch, where the bottles are placed in bins above one another. This arch is kept a little below melting heat, till the whole quantity, which amounts to 10 or 12 gross in each arch, is deposited, when the fire is allowed to die out.

Slag Glass.—Under a patent obtained by Mr. Bashley Britten, a manufacture of bottles has recently been established with every prospect of success, the leading peculiarity of the process being the use of blast-furnace slag, molten as it issues from the furnace, as a principal ingredient. The use of slag in bottle-making is by no means new, but the catching of the intensely hot liquid mass and its immediate use for glass-making had not before been attempted; and therein results the great saving in fuel and consequent economy of the manufacture. A company formed to work the process has erected glass-works in Northamptonshire in the immediate neighborhood of a set of blast furnaces, and these works are now in constant and successful operation. A regenerative gas furnace applied to a glass tank working on Dr. Siemens's continuous principle is used, and in it the ingredients of the glass are fed at one end of the tank, where they are fused and fined, and the fused "metal" flows through a bridge to the other end of the tank, whence it is worked out, blown into bottles, and annealed in the usual way. The tank is from time to time fed with fused slag taken as it flows from the blast furnaces, and with it is introduced the required proportion of the other ingredients. The slag furnishes more than half the total material of the glass, and, as it is already melted, its use effects a saving of about half the heat or fuel and also half of the time necessary for the production of the "metal." Thus the prime cost of the glass as it is worked out is considerably less than that of glass made in the ordinary way. The natural tint of the glass thus produced is greenish, but it can be colored to any required tint, and by careful fining and bleaching it can be produced almost as colorless as common window glass. The working qualities of the glass are excellent; it comes from the furnace in that beautifully plastic condition which renders it capable of being blown, cast, pressed, or otherwise moulded into any desired form, and the company expects to manufacture other articles besides bottles from a material so cheaply produced.

Optical Glass is of two principal kinds—flint and crown—the combination of these two, with their different refractive powers, being necessary to produce perfect achromatism in the lenses of telescopes. For astronomical telescopes, for microscopes, and for all delicate scientific instruments in which optical glass occupies a place, glass of the utmost purity, transparency, freedom from color, streaks, and striæ is of the highest importance; and to secure these qualities to the fullest extent much care, trouble, and expense are requisite. The first really successful maker of optical flint glass was M. Guinand of Solothurn in Switzerland who succeeded in making discs 9 inches in diameter free from striæ. Guinand died in 1823, and from his son, M. George Bontemps learned his secret, and at Choisy-le-Roi, near Paris, further improved the manufacture. In 1848 M. Bontemps was induced by Messrs. Chance of Birmingham to establish the art in their great works. In the hands of that eminent firm the preparation of optical glass has attained a perfection not approached by any other glass workers, and the *chef d'œuvre* of optical glass hitherto made consists of a pair of flint and crown glass discs, 29 inches in diameter, exhibited by Chance Brothers at Paris in 1855. Regarding these Sir David Brewster said, "I have entertained the hope that the English Government would purchase these discs and construct with them the grandest achromatic telescope that ever was contemplated by the most sanguine astronomer." They were, however, purchased by the French Government in 1867.

Optical flint glass contains more lead, and is consequently heavier and more refractive, than the quality used for common purposes. It is made in a furnace having a single covered pot, and Guinand's secret consisted in constantly stirring the mass while it is in a molten condition so as to keep the heavier lead silicate from falling to the bottom. For the very highest qualities of optical glass, the contents of the pot are most scrupulously cleared, and the stirring is continued after the heat is lowered till the contents are cooled down to little more than a red heat. The furnace is then closed and the metal is allowed to cool and anneal gradually in the pot within the furnace. When withdrawn the pot is broken, and the mass of glass is polished on two opposite sides so that any imperfections may be detected by examination. From the mass, cut horizontally, perfect discs of such size as can be formed are then obtained. Optical glass is also blown into thick cylinders, and cast in slabs from ¼ inch to 1 inch in thickness.

Chance Brothers make six kinds of optical glass, of which the average densities and refractive indices for the three hydrogen lines and for the sodium line are given in the following table:—

| | Density. | C. | D. | F. | G. |
|---|---|---|---|---|---|
| Hard crown | 2·485 | 1·5146 | 1·5172 | 1·5232 | 1·5280 |
| Soft crown | 2·55 | 1·5119 | 1·5146 | 1·5210 | 1·5263 |
| Light flint | 3·21 | 1·5700 | 1·5740 | 1·5839 | 1·5922 |
| Deuse flint | 3·66 | 1·6175 | 1·6224 | 1·6348 | 1·6453 |
| Extra dense flint | 3·85 | 1·6450 | 1·6504 | 1·6643 | 1·6716 |
| Double extra dense flint | 4·45 | 1·7036 | 1·7103 | 1·7273 | ... |

In 1830 Faraday proposed the use of a compound silicate and borate of lead glass, with a density of 5·44, for optical use; and Maez and Clemandot have successfully introduced a borosilicate of zinc. An optical glass of higher refractive and dispersive power than any previously known has been made by Lamy from a mixture of silica, red lead, and carbonate of thallium. The glass is perfectly homogeneous, but of a yellow tint—an evil, however, said to be avoidable by the use of the sulphate instead of the carbonate of thallium. The extraordinary refractivo power of the glass renders it peculiarly adapted for the fabrication of imitation precious stones.

Strass.—Remarkably faithful imitations of every kind of precious stone can be made from suitably prepared and, when necessary, colored glass. The transparent basis from which artificial precious stones is prepared is called *strass* or *paste*, a material which must of necessity be the purest, most transparent, and most highly refractive glass that can be prepared. These qualities are combined in the highest degree in a flint glass of unusual density from the very large percentage of lead it contains. Among various mixtures given by Donault-Wieland as suitable for strass the following is an example:—powdered quartz 300 parts, red lead 470, potash (purified by alcohol) 163, borax 22, and white arsenic 1 part by weight. Special precautions are adopted in the melting of the materials, and the finished colorless glass is used for imitating diamonds. When employed to imitate colored precious stones the strass is melted up with various metallic oxides, to which reference will be made under colored glass. Artificial precious stones are, of course, easily distinguished from real stones by their inferior hardness, and by chemical tests. They may also be generally detected by a comparatively soft warm sensation they communicate when applied to the tongue.

Glass Tubes, used for gauge glass for steam boilers and for many other purposes, are made by a very simple process; but as the manufacture is a separate department of industry it demands some notice. A gathering of glass is made on a blowpipe, which is marvered, and slightly blown, so as to form a thick-walled elongated globe. To the end of this globe opposite the blowing pipe a pontil-rod is attached by an assistant, and the two workmen move backwards the one from the other, drawing out the tube as they recede. One or two boys watch the process of elongation, and when the tube reaches the desired gauge they fan its surface so as to "set" the glass, and thus prevent further attenuation at that particular point. The relation of the mass of metal to the original cavity determines the comparative stoutness and bore or internal diameter of the tube, and it requires much dexterity to make a tube at once straight and of uniform gauge and diameter. In drawing out tubes of large gauge the operatives recede from each other at a slow rate; and in proportion as the size of tube decreases the rate of drawing out increases. In the Venetian factories, where small tubes for beads are made, the workmen move at a smart walking pace.

Massive Glass.—Under this term may be conveniently noticed the manufacture of various familiar solid glass objects which do not acquire their form either by blowing or pressing

in the ordinary sense. *Glass Rods* form the basis of many of these objects; and the formation of a plain rod of glass is accomplished by a manipulation in all respects similar to that described under the head of glass tubes, the only difference being that the rod is drawn from a solid instead of from a hollow or blown gathering as in the case with tube drawing. From solid rod glass, glass buttons of various forms are "pinched" by heating the rod till it softens, and immediately pinching it in heated moulds made and worked like ordinary pincers, but having moulds of suitable form in place of the gripping surface of the pincers. The small facets of glass lustres and girandoles and glass marbles, are made by an analogous process.

Spun Glass.—Certain qualities of glass in the plastic condition are capable of being drawn out to threads of great tenuity, which, while possessing much brilliancy and beauty of color, are perfectly flexible and elastic, and feel to the touch soft and smooth like fine wool. A good deal of attention has been given to glass spinning in Vienna and in the Bohemian glass-works, the thread produced being woven into many textiles for upholstery and wearing purposes. The material is specially useful in millinery ornaments owing to the fine colors in which it may be produced, and to the fact that it is unalterable in and unaffected by all kinds of weather.

A remarkable and novel application of glass was patented in 1878 by Mr. J. B. Hannay. It consists in making glass a cementing or binding substance in the manufacture of emery wheels, now so much used instead of files. For preparing the wheels any broken fragments of glass are utilized. These are reduced to powder, mixed with proportions of powdered flints and emery, and in the form of a cake introduced on a layer of paper into a furnace where the material is submitted to a heat sufficient to fuse it into a compact ringing mass. The resulting cake is of intense hardness and durability, and cuts through ordinary emery wheels with ease. As the glassy emery wheels can be made very much cheaper than those at present in use, there is little doubt that this material will come into extensive use, in the rapidly increasing applications of emery to grinding, smoothing, and cutting.

Colored Glass.—When to the ordinary materials in the melting pot small quantities of various metallic oxides and other mineral substances are added, colored but still transparent glass is produced. The colors yielded vary in intensity according to the proportion of oxides used; and the temperature at which the fusion is effected, the length of time the molten glass remains in the melting pot, not only modify, but actually change altogether, the resulting color. Indeed, it has been asserted by M. Bontemps that all the colors of the spectrum may be obtained by the use of one oxide alone, if employed in varying proportions and at different temperatures. The materials, temperatures, and other conditions employed by manufacturers for producing certain of their color effects in glass are kept as trade secrets; although, in a general way the substances which produce particular colors are perfectly well known. Blue is obtained by the use of cobalt,—the ordinary blue pigment smalt being a powdered cobalt glass. Yellow glass can be prepared from several sources: uranium yields a beautiful opalescent yellow; salts of silver are the source of fine shades of yellow; a different tone of the same color may also be obtained from oxide of antimony; and a dull yellow is produced from powdered charcoal. Green was at one time prepared chiefly by the use of cupric oxide and of ferrous oxide; now oxido of chromium—which produces a beautiful emerald green—is much employed, that substance being mixed with other oxides when modified colors are desired. For red glass, cuprous oxide is employed to produce an intense ruby tint; and the purple of Cassius—a compound of gold with tin oxide—yields magnificent shades of ruby, carmine, and pink, while oxide of iron also is the source of a brownish-red color. For the production of violet tints the black oxide of manganese is depended on, and a mixture of the oxides of manganese and cobalt is employed for black. The deep-black glass prepared at Venice for making glass beads contains a large percentage—about 11·40—of manganese. Avanturine, an imitation in glass of the mineral bearing that name, is a warm, brown, opaque glassy body, studded with innumerable minute spangles having a metallic lustre. It was originally made in the Venetian glass-houses, but can now be manufactured generally throughout the Continent. According to Von Pettenkofer, the metallic spangles consist of cuprous oxide, and one means of preparing the glass consists of melting equal parts of cuprous oxide and ferrous oxide with the glassy mass. The other opaque varieties of colored glass are obtained by using the various metallic oxides with the compounds that produce milky or white glass.

The uses of colored glass are various, the most obvious and usual being for ornamental windows, for signal lights, for imitation precious stones and ornamental table glass, etc. For the imitation of precious stones the strass already alluded to forms the basis, and both flint glass and Bohemian (potash) glass are much used for colored domestic glass. Window and signal colored glass are made both as rough plate and as sheet glass. In the case of plate glass the metal is, of course, uniformly colored throughout, but colored sheet glass may either be composed of "pot metal" or it may be "flashed colors." Pot metal consists of glass uniformly colored throughout; but in flashed colors the body o. the glass is transparent sheet metal covered on one surface only with colored glass. It is very simply made: the workman, taking up on the end of his blowing tube a gathering of clear metal from one pot, dips this into a pot of colored metal, thus gathering over the transparent mass a uniform stratum of colored glass. The whole is then blown in the ordinary manner, and according to the original relative proportions of clear and colored metal will be the thickness of each in the finished sheet. It is obvious that this process admits of many variations, such as gathering the colored metal first, or making alternate gatherings of colored and clear metal so as to have clear within colored, colored within clear, and so on.

Iridescent Glass.—Ancient glass, which has for ages been submitted to the slow disintegrating influence of the damp of the earth and other gently operating agencies, in many instances displays an iridescent play of colors of a most magnificent description. The iridescence thus shown, it has been long known, is due to a process of decomposition resulting in the formation of excessively thin scales of glass. Numerous attempts have been made to imitate by artificial means the gorgeous display of colors thus produced by the slowly acting influences of many centuries, and a certain amount of success has attended some of these efforts. The Venetian glass workers possess the means of giving the surface of their glass a kind of metallic iridescence; and in certain Hungarian glass houses iridescent glass has been made for at least about 20 years. But in 1873, at the Vienna Exhibition, iridescent glass formed a prominent feature, and since that time it has become very common. The iridescent glass now generally seen is a plain flint glass having a slightly metallic tinge and a play of colors like a soap bubble. It is probable that several methods of producing iridescence in glass are practised, as the nacreous lustre in different examples varies considerably. The subject was investigated by MM. Fremy and Clemandot; and under a patent obtained by the latter gentleman, one method, commonly practised, has been made public. It consists in submitting the object to be iridized to the influence of a weak acid solution—such as water with 15 per cent. of hydrochloric acid—under the combined influence of heat and pressure. The effect certainly falls immensely short of the iridescence of ancient glass, but the glass assumes permanently a pearly iridescence, and, though the effect is tiresome, the process will doubtless continue to occupy a place among the methods of ornamenting table glass, etc.

Opaque Glass.—Absence of transparency in glass may be due to any of three causes—(1) to the grinding, or roughening by other means, of the surface of ordinary clear glass; (2) to devitrification or crystallization of the substance; and (3) to the mechanical intermixture of an opaque substance in the glassy mass. Obscured glass was formerly principally prepared by a process of grinding the surface,—the means employed in the case of sheet and plate glass being simply the smoothing process, which forms an intermediate stage in the operation of polishing plate glass. Now the greater part of ordinary obscured glass is prepared by the agency of Tilghman's sand blast, an apparatus by which a fine stream of sand is blown with great violence against the glassy surface. The impinging grains of sand abrade the surface with extraordinary rapidity, and by protecting certain portions with suitable stencils, elaborate patterns in clear glass are produced in a very simple manner. Alabaster glass, so called on account of its resemblance to that substance, is an opaque variety of glass which has been long known and used. Its opacity is due to a process of devitrification it readily undergoes, favored by the excess of uncombined silica used in its preparation. The material is prepared from a combination such as 100 parts of sand, 40 of potash, 5 of borax, and 5 of talc (silicate of magnesia). Into the composition of this glass it will be observed no lime enters, although sometimes bone-earth is added to the materials. For enamel glass a mixture of varying proportions of lead and tin oxides is prepared by calcining the two metals together, and using the compound in the preparation of a mixture for fusing, of which the following is an example:—sand 100 parts, pure potash 80, and mixed oxides 200 parts. The proportion of tin varies within wide limits, and oxide of antimony may be substituted for the tin. Bone glass, milk glass, and opal glass, differing in degree of opacity, are made by adding to the materials of clear glass large proportions of bone-ash, or of oxide of tin, or both together, and with these substances white arsenic may also be combined. The following is an example of a batch for opal-flint glass:—sand 100 parts, bone-ash 30, potash 30, borax 5, and red lead 5 parts. Such a glass was formerly in extensive use for the opal shades of gas lights and moderator lamps, etc.; but the ruddy glow possessed by the rays passing through the imperfectly opaque glass was an objectionable feature in the resulting material. During recent years an opal or milk glass free from such a defect has been introduced, and it is now in

extensive use for globes. This preparation, which diffuses light from its surface in a clear pure white glow, owes its milky opacity to the use of cryolite—a mineral substance consisting of a double fluoride of aluminium and sodium ($Al_2F_6$,6NaF) obtained from Greenland. The cryolite glass was first brought prominently into public notice by the Hot-Cast Porcelain Company of Philadelphia, by whom it was made on a large scale, although the material had been in use in Bohemian and Silesian glass-works for some years previous to the commencement of the manufacture in America. For milk white glass the materials used are—sand 100 parts, cryolite 40, and zinc oxide 10 parts. The finished glass, which is remarkably strong, hard, and indifferent to acids contains about 15 per cent. of undecomposed cryolite, to which its opacity is due. The copious evolution of fumes of hydrofluoric acid during the melting, which continues even in the working, is the source of serious difficulty in the manufacture of cryolite glass.

Toughened or Hardened Glass.—In the year 1875 the announcement that a French gentleman, M. de la Bastie, had discovered a means of rendering glass practically unbreakable attracted a great amount of attention; and his statements were immediately made the subject of practical investigation throughout the glass-making community. All the experiments made in connection with M. de la Bastie's process tended to confirm his claim to have discovered a method of rendering glass capable of bearing a shock or strain variously estimated at from 30 to 100 times greater than the same material annealed in the common way. De la Bastie was led to undertake the prolonged series of experiments, which ultimately resulted in his discovery, by the consideration that the brittleness of glass arises from weak cohesion of its molecules; and his efforts were first directed to improving its molecular arrangement, by submitting glass, in a molten state, to forcible compression. This series of experiments led to no practical result; and the line of investigation he ultimately pursued, as well as the merits and defects of his process, are thus succinctly stated by Mr. H. J. Powell of Whitefriars Glass Works, with whom M. de la Bastie carried out his first practical experiments with hollow glass. Mr. Powell, writing in August, 1875, says of the process:—

"That it consists in plunging glass heated to the melting point into a bath containing an oleaginous mixture, at a high temperature, but considerably cooler than the glass itself; and that this, according to the specification of the patentee, is effected by re-heating already manufactured and annealed glass in a kiln, and passing it thence into the bath. After a rough trial of this process, which certainly answers well for flat or solid glass, we decided that it is defective, for hollow flint glass, as hollow vessels, left to themselves in a kiln, are almost certain to collapse on reaching the required heat. To avoid this difficulty, and knowing that a vessel in course of manufacture, however hot, is always under control whilst it remains on the workman's rod, we placed a bath as near the mouth of the working-pot as possible, and directed the workman, instead of sending the finished vessel to the annealing oven, to drop it into the bath. The vessel is caught in a wire net, and is ready for removal as soon as it has acquired the temperature of the bath. For all vessels made in one piece, *e. g.*, tumblers, finger basins, etc., this process answers well; and it is obvious that if it proves to be the best way of treating hollow flint glass, the use, for this description of glass, of the complicated machinery described in M. de la Bastie's specification will be done away with, and the glass will be tempered in the course of manufacture, instead of being re-heated and tempered after it has been already manufactured and annealed. We ascertained, with M. de la Bastie's aid, the right constituents and right temperature of a bath for flint glass; for although the conditions for sheet, plate, and flint glass are nearly the same, there is a difference, and it seems probable that every chemically different glass, and even every different thickness of glass, may require certain variations. In our experiments as to the hardness of the glass, we found that it could be marked, but not cut, with the diamond, and, although it could be smoothed and engraved in the ordinary way, that the disturbance caused by the wheel, when penetrating to any appreciable depth, tended to weaken, or even to cause the destruction of the entire mass. The value of the invention, as far as it concerns flint glass, is at present somewhat modified by difficulties in manipulation. 1. It seems to be impossible to heat a vessel made up of different pieces and of various thicknesses to an absolutely equal temperature throughout, so that the whole may be equally tempered. 2. It seems also impossible to displace the air from a narrow-mouthed vessel quick enough for the inside and outside to be tempered simultaneously. However, setting aside these difficulties, we come to a point which applies equally to all sorts of hardened glass. Hardened glass is not 'unbreakable;' it is only harder than ordinary glass, and though it undoubtedly stands rough usage better, it has the disadvantage of being utterly disintegrated as soon as it receives the slightest fracture, and up to the present, until broken, of being undistinguishable from ordinary glass. This glass is known as 'toughened' glass, and we have seen the terms 'malleable' and 'annealed' applied to it. Nothing can be more misleading than these unfortunate epithets. The glass is hard, and not tough or malleable, and is the very opposite to annealed glass. Annealed glass is that the molcules of which have been allowed to settle themselves; the molecules of hardened glass have been tortured into their position, and until the glass is broken are subject to an extreme tension. It is the sudden change of temperature that 'hardens;' glass heated up together with the oil may be annealed, but decidedly is not hardened. A piece of hardened glass is only a modified Rupert's drop, *i. e.*, it is case-hardened; the fracture of both is identical, both resist the diamond, and both can be annealed. Moreover, in the middle of imperfectly hardened glass a line is plainly visible, which seems to mark the extent of the case-hardening. This line resolves itself under the microscope into a mass of bubbles and striæ; it seems to be the nucleus of breakage, and consequently as soon as the cutting wheel approaches it, utter destruction ensues."

The great anticipations which at first were formed as to the extended use of hardened glass have not been realized. M. de la Bastie has improved several of his processes, but the demand for his productions, at no time great, is understood to decrease rather than to increase. For a short time the process was worked by both Messrs. Powell and Messrs. Pellatt in London, but both these eminent firms have given it entirely up. Sheet glass hardened by the process does not appear ever to have come generally into the market, the most serious obstacle to its introduction being the impossibility of cutting it with the diamond, after which the utter destruction resulting from fracture is a serious defect. For laboratory purposes—as flasks and beakers, etc.—it has been suggested that the glass has great advantages, but experiments have proved that its great resistance is not absolutely reliable, and that hardened vessels submitted to a high heat lose their distinguishing peculiarities and become as common glass. Thus a glass, partially filled with water and heated considerably above the boiling point at the parts uncovered with water, broke, the bottom of the glass showing the fracture peculiar to hardened glass, while the upper uncovered part was broken into large sharp-edged fragments like common glass. A modified process of hardening, patented by Herr F. Siemens, consists in pressing and suddenly cooling the glass in moulds specially constructed to conduct away the heat with the various degrees of rapidity found to produce the best results.

Statistics of the Glass Trade.—According to a factory report of 1871 there were in that year 240 glass-works in the United Kingdom, employing, in addition to steam-power, 21,434 operatives, of whom 2116 were females. Of these works 213 were in England, 19 in Scotland, and 8 in Ireland. Further, there were at the same date 37 glass-cutting factories, employing 500 people, principally situated in the county of Warwick. The quantities and value of glass manufactures exported were as under in the year 1878:—

| | | | |
|---|---|---|---|
| Plate glass | 1,156,435 | sq. ft. | £106,906 |
| Flint glass | 93,112 | cwts. | 239,966 |
| Common bottles | 575,160 | " | 308,481 |
| Other glass manufactures | 72,209 | " | 99,170 |
| | | | £754,523 |

In 1878 the imports of manufactured glass were thus given:—

| | | | |
|---|---|---|---|
| Window glass | 652,325 | cwts. | £452,202 |
| Flint glass | 143,665 | " | 489,518 |
| Plate glass | 91,198 | " | 233,602 |
| Glass manufactures | 335,751 | " | 879,733 |
| | 1,222,939 | | £2,055,055 |

The following table shows the comparative imports and exports of glass in the ten years ended 1877:—

| | Imports, Foreign. | Exports of British Glass. | |
|---|---|---|---|
| | | Plate Glass. | Other Kinds. |
| | Cwts. | Square Feet. | Cwts. |
| 1868 | 609,806 | 911,330 | 868,950 |
| 1869 | 601,070 | 1,076,130 | 933,475 |
| 1870 | 602,376 | 1,357,508 | 799,252 |
| 1871 | 629,472 | 1,643,575 | 847,988 |
| 1872 | 688,156 | 2,131,924 | 1,002,498 |
| 1873 | 807,410 | 2,183,106 | 1,148,640 |
| 1874 | 946,903 | 1,411,268 | 1,114,253 |
| 1875 | 933,677 | 1,609,180 | 880,933 |
| 1876 | 1,060,361 | 1,779,628 | 743,495 |
| 1877 | 1,140,694 | 1,157,063 | 792,424 |

In the *Bulletin de la Société d'Encouragement pour l'industrie nationale* for 1877 there is an elaborate statistical computation of the extent and value of the glass manufacture throughout the world, based chiefly on returns applicable to 1874. The writer, M. Henry de Fontaine, arrives at the conclusion that the annual production of glass has almost doubled in the past twenty years, and estimates the total yearly production throughout the world at a value of six hundred millions of francs.

*Bibliography.*—The literature of glass-making of English origin is scanty and imperfect. In France and Germany the subject has received much fuller attention. The following list embraces the principal works:—Antonio Neri, *Ars Vitraria, cum Merritti observationibus*, Amst., 1668 (Neri's work was translated into English by A. Merret in 1662, and the translation, *The Art of making Glass*, was privately reprinted by Sir T. Phillipps, Bart., in 1826); Johann Kunkel, *Vollstandige Glasmacher-Kunst*, Nuremberg, 1785; Apsley Pellatt, *Curiosities of Glass-making*, London, 1849; A. Sauzay, *Marvels of Glass-making* (from the French), London, 1869; G. Bontemps, *Guide du Verrier*, Paris, 1868; E. Peligot, *Le Verre, son histoire, sa fabrication*, Paris, 1878; W. Stein, *Die Glas-fabrikation* (in Bolley's *Technologie*, vol. iii.), Brunswick, 1862; H. E. Benrath,

*Die Glasfabrikation*, Brunswick, 1875; J. Falck and L. Lobmeyr, *Die Glasindustrie*, Vienna, 1875. (J. PA.)

## Glass Painting.

The manufacture of colored glass, which is the basis of the beautiful and interesting art of glass painting, originated at a period of remote antiquity, and the use of enamels, to vary or ornament its surface, was known to the ancient Egyptians; but the formation of windows of mosaics of colored glass upon which the shapes of figures and ornaments are painted with an enamel fixed by fire is mediæval, and emphatically a Christian art. In all probability it was suggested by the mosaic pictures with which churches were adorned from an early period for the instruction of the illiterate, as was shown by the inscription which they bore, "sanctæ plebi Dei." The step from mosaic pictures to glass mosaic windows was merely a question of time; it is not known when the step was taken, but colored windows existed in St. Sophia at Constantinople in the 6th century, whilst the basilicas of St. John Lateran and of St. Peter at Rome were adorned about the same time in the same manner. In the year 709 Wilfrid, bishop of York, invited workers in glass from France ("artifices lapidearum et vitrearum fenestrarum primus in Angliam ascivit"). The French claim the honor of having invented the process of painting upon the mosaic windows of colored glass, and of thus transforming them into works of art, and also of teaching this to the English, who in their turn instructed the Germans; but Muratori, in the second volume of his *Antichità Italiche* of the Middle Ages, printed a treatise on mosaic and painted glass written by an anonymous Italian in the 8th century, and probably not later than the 11th was written the interesting essay *Diversarum Artium Schedula Theophili Presbyteri et Monachi*, which details with minute accuracy the process of painted glass as it has been practised with some additions and modifications, throughout the best periods of the art; it may reasonably be assumed that Theophilus describes methods invented before his time. Probably the oldest specimen of glass painting now existing is a window of the 11th century in a church at Neuwiller, in Alsace, representing St. Timothy. The figure is rudely designed, but, with the rich border of ornament, shows that the executant knew his art, which in the following century is further illustrated by windows in St. Denis, near Paris, erected by the abbot Suger, which are still preserved. It was however in the 13th century, that great age of the revival of art, that glass painting attained its first great development, and notwithstanding the claims advanced by France, it is most probable that as all art radiated from Italy as a general centre of invention and progress, as well as of faith and dogma, so glass painting partook of the general impulse. It has indeed been asserted that glass manufactured in the north was superior to that produced in Italy, and this is admitted by Vasari, but an examination of old Italian windows throws doubt upon this statement, for the Italian glass will be found to be more even in texture, more diaphanous, and certainly not inferior in color, whilst the beautiful, pearly, white glass of the earliest date in Italy is superior to the pale green representing white in northern glass, and assorts much more harmoniously with the glowing colored glass with which it is associated. Considered as a branch of fine art, Italian painted glass occupied a very high position at all periods of its history, for the designs were frequently made by some of the most famous of that long roll of immortal artists who have had so few equals elsewhere. In Germany the family of Hirschvogel of Nuremberg and other eminent artists, including, it is popularly believed, Albert Dürer, and in France Jean Cousin, Bernard Palissy, Louis Fauconnier, and others, equalled the Italian glass-painters, whilst both German and French artists excelled them in technical processes.

The late Mr. Charles Winston, author of *An Inquiry into the difference of style observable in Ancient Glass Painting, especially in England*, with his usual accuracy and profound knowledge of his subject, thus classifies the consecutive styles:—the Early English, from the date of the earliest specimens extend to the year 1280; the Decorated, which prevailed from 1280 to 1380; the Perpendicular from 1380 to 1530; and the Cinquecento from 1500 to 1550. The styles successively prevalent in Italy, although they have an affinity with those following each other in northern countries, cannot be accurately designated by the titles selected in England, the last excepted. Like other branches of painting they are most readily divided and understood by centuries; as the 13th century, a style principally influenced by Giunta Pisano and Cimabue; the 14th century, in which the spirit of Giotto and Orcagna and their followers prevailed; the 15th century, the first period of which was transitional, and the second early revival, as illustrated by the designs for windows of Lorenzo Ghiberti, Donatello, Paolo Ucello, Pietro Perugino, Andrea della Robbia, and other great artists of the time. The last age, called by Mr. Winston the Cinquecento, lasted in Italy beyond the period assigned by him for its termination, and was characterized by florid magnificence of design and splendor of color, imitative of the pictorial art of that age, and the ornament resembled that prevalent amongst the ornamentists of the schools of Raphael and Michelangelo.

In this brief analysis of the history and practice of glass painting, the Italian examples of the art are selected for description as being less known than those existing in other parts of Europe, which have been minutely and ably illustrated. Besides being classified by centuries, Italian glass painting may be appropriately arranged under the following heads or schools:—the Pisan, Florentine, Sienese, Umbrian, Lucchese, Bolognese, Lombard, and Venetian; for notwithstanding the lamentable destruction of painted glass in Italy even now in progress, specimens by artists belonging to these schools still exist, and the names of a numerous array of glass-painters of these provinces are preserved. The best examples extant of this art in Italy of the first half of the 13th century are two couplets in the apse of the famous basilica of St. Francis at Assisi. In general arrangement and design they resemble windows of the same age in other parts of Europe classed by Mr. Winston under the general head of Early English, being divided into panels of varied and admirably designed geometrical forms surrounded by diapers and borders of rich fancy and glowing color, which, however, are rather more confused than similar details in contemporary glass elsewhere. The panels are filled with scripture subjects, and Italian skill and refinement are obvious in the design of the figures; this may be readily understood when it is considered that Italian artists of this time rendered the Greek art, universally followed, with more sentiment and power than any other people. The ornament shows the influence of Byzantine conventions, but the ornamentists imitated natural forms of foliage sooner than northern artists. A remarkable peculiarity of the early painted windows at Assisi, which are here taken as the best and almost the only specimens of 13th-century glass left in Italy, is that throughout the couplets the backgrounds in each light differ in color. The subjects for instance in the right light are on a blue ground, on the left on a red ground, in other examples the grounds are alternately blue and green. It might be supposed that all unity of effect must have been destroyed in this way; but such is the skill with which the general harmony of color is arranged, that the counterchanges are less objectionable than might appear possible. Early Italian glass painting, like that of other parts of Europe, is characterized by an obvious ignorance of perspective on the part of the designers, but there are manifest indications of attempts to represent retreating surfaces and lines; that these have not the effect intended was not due, as some suppose, to the maintenance of a principle appropriate to glass painting, but simply to a want of knowledge of perspective laws common to all, even the greatest artists of the time.

Besides executing panel windows with small figures, the artists of the 13th century painted figures of comparatively large proportions under canopies of simple and primitive forms. These figure windows were placed in positions at a distance from the eye, as above in the clerestory, or at the ends of aisles. At Assisi such figures are painted at the bases of some of the windows irrespective of the idea of distance, the upper portions being filled with panels and small figures. This irrational system gave way to the entire window being filled with large figures placed over each other within canopies or geometric borders, a method of design which survived in Italy to the close of the 15th century.

The colored windows of the upper and of the lower church are associated with mural paintings which cover every available space on the walls and vaults. It might be supposed that the refulgent painted glass would either obscure the frescoes or diminish their effect by contrast; but

in the first place the glass is not so thick as that of northern manufacture, nor is it made opaque by the effect of climate, whilst, as already noticed, the white glass is purer, and the brilliant sun of a southern climate illumines the frescoes sufficiently, notwithstanding the colored medium through which the rays are transmitted. Such is the case at Assisi; but at Florence the colored glass in the cathedral darkens the church too much, from causes which will be explained afterwards. The true method of combining colored glass in a building with the presence of pictures and sculpture in a less sunny climate will be illustrated in describing glass painting of the 16th century, the subject being important at the present time.

In the next great age of art, that which commences with the triumphs of the genius of Giotto, glass painting evidently shared in the general progress. No windows remain which are associated with his name as designer, but in Santa Croce at Florence, by the will of Count Alberto di Lapo, dated the 9th of July, 1348, money was provided for adorning the apse of the church with frescoes and painted windows to be completed in three years. The frescoes were painted by Angelo di Taddeo Gaddi, and it seems reasonable to suppose that he designed two of the three windows—that in the centre being of later date. The following extract from the archives of the cathedral of Florence shows that Angelo Gaddi designed for glass-painters: "A window in Santa Reparata"—the ancient name of the cathedral—"over the door towards the street of the Cassettai is commissioned of Antonio of Pisa, master glass-painter, and the design is by Angelo Gaddi." The windows illustrate the system of ranging single figures under canopies over each other. The coloring is harsh; there is too great a prevalence of dark green; and the general design of ornament is meagre and confused. This is increased by the capricious changes of the colors of the canopies, which are not white, these being rare in Italian glass painting. Thus in one of the windows the first two canopies are respectively red and green, which colors are counterchanged in those immediately over; the next two in ascent are green and yellow, the next pair brown and yellow, the fifth order shows both yellow. Thus that variety of color prevalent in the backgrounds of Italian 13th-century work is found in the canopies of windows of the next century, a custom limited to glass painting, and not found as a rule either in mural or other pictures. There are in Santa Croce several windows of the 14th century, but they are generally inferior to those of the same period extant in St. Francis of Assisi, where there are important examples of rare beauty of design and workmanship, more harmoniously colored than those at Florence, and suggesting that the Umbrian excels the Florentine school of glass painting.

Throughout the whole of the painted windows existing in Florence, of the fully developed style of the 14th century, and for a considerable portion of the 15th, the influence of the architectural design of Giotto and Orcagna is very perceptible. The graceful twisted shafts common to the works of both architects, the richly adorned niches and gablets, the dome-like covering of the famous baldacchino in the church of Or San Michele, the work of Orcagna, are features which are imitated in various ways by Italian glass-painters. The color is especially noteworthy; the canopy, somewhat squat in form, is adorned in every part with rich and diversified colors evidently imitative of the varied marbles and the infinity of marble inlay and mosaics, characteristic of so much of the mediæval architecture of Italy; whilst in northern countries the canopies in windows, with their beautiful details of form showing such rich fancy and such graceful lines, are chiefly white, not that they are altogether colorless, for it is of the perfection of mediæval architecture to associate color with form. That which in Italy was done by the help of rich stores of marbles of many hues, was effected in the north, where these were not available, by means of polychromatic painting, which was imitated in window design by the glass-painters. Thus the canopies in Italian windows differ as much from those prevalent at the same period in the rest of Europe as the campanile of Giotto differs from the spires raised by the genius of northern architecture.

In the history of painted glass in Italy during the 15th century, the windows of the cathedral of Florence, dating from 1390 to 1503, occupy an important position, not only by reason of their interest as connected with that celebrated church, but also because they were designed and executed by artists of the highest reputation. The cathedral was founded on the 8th of September, 1298, the architect being Arnolfo di Cambio di Colle di Valdelsa. In 1334 Maestro Giotto was architect, and commenced the famous belfry. In 1364 the church was vaulted over at its eastern end, and in 1420 Filippo Brunelleschi and Lorenzo Ghiberti, who built the clerestory of the nave with its round windows and Renaissance cornice, were appointed joint architects. Painted glass was introduced into the windows thirty-six years before the completion of the cupola, and thirty before that of the clerestory. These dates are an interesting testimony to the importance attached at the time to painted windows as portions of the design of so great a church. They were erected in the aisles, before the nave was finished, by Don Lionardo di Simone, monk of Vallombrosa, and Niccolo di Pietro della Magna, so early as 1390, and when the nave was roofed over by its architects, Fra Bernardino di Stefano executed the two first windows of the clerestory from designs by Lorenzo Ghiberti.[1] Ghiberti is also alleged to have designed many of the painted windows at the east end of the church; but those now existing, judging by the design and color, as well as by the technical execution, cannot be his, for they are manifestly of earlier date, whilst the authorship of some of them is recorded in the archives without reference to Ghiberti. One only, on the north side of the apse and in the lower row, suggests the design of this great artist, the suggestion being strengthened by the fact that the diapered ornament on the ruby dress of the figure is made by the wheel, which brings this window within the 15th century, whilst the diapers in the other figures of the same series are executed in an older style. It has been stated that Ghiberti advised the municipality of Florence to invite a celebrated glass-painter of Lübeck, Francesco di Domenico Lievi da Gambassi, by letters, the second being dated October 15, 1436, to settle in Florence with special privileges; he came, and it is assumed that he painted Ghiberti's designs for glass, but of this there seems to be no satisfactory evidence. We find that in 1434, before his arrival, Maestro Domenico di Pisa painted the east window of the drum, representing the coronation of the Virgin, which was designed by Donatello in competition with Ghiberti, and preferred. As it was on the 12th of January, 1434, that Brunelleschi completed the dome, evidently no time was lost in commencing the painted windows. Bernardo di Francesco del Boni is recorded in the archives as having executed in 1442 the following windows in the drum, called in Italian the tribune:—the Resurrection, designed by Paolo Uccello, and the Ascension and the Prayer in the Garden, by Lorenzo Ghiberti, although by this time Francesco di Lievi da Gambassi had been some time in Florence. Bernardo del Boni is also recorded to have painted the Annunciation designed by Uccello, removed some years ago, and the Ascension described as being either by Ghiberti or Uccello; the uncertainty is curious. In 1448 the same artist painted the Presentation in the Temple, which was designed by Ghiberti. What windows then did the artist from Lübeck really execute? Born an Italian, he was instructed from his youth in Germany, and it is reasonable to suppose that his style would be German. Now several of the upper windows of the transepts contain figures which have a decided affinity with German ideas, and it is not unreasonable to suppose that these were by the new

[1] This circumstance has led to the erroneous statement, repeated to the present time in every guide-book and by every writer on the cathedral, and to the still prevalent belief, that the three windows in the façade of the church were designed by Ghiberti, who has himself recorded:—"I designed for the front of Santa Maria del Fiore, for the central round window of the façade, the Assumption of our Lady, and I designed those on each side." The windows which Ghiberti really designed were the great circle of the façade, a noble work still in its place, and the two of the clerestory on each side of it, long since removed and lost. That they were painted by Fra Bernardino di Stefano in 1423 is thus shown in the archives of the cathedral—"Fra Bernardino di Stefano, of the order of the Preachers of Santa Maria Novella, is to execute two round windows in the nave of Sa Maria del Fiore, one to the right and the other to the left,—that to the right representing Joachim driven from the Temple, that to the left the Death of the Virgin Mary, and the designs are by Lorenzo di Bartoluccio (Ghiberti)." It is thus evident that the windows of the clerestory of the nave were to be painted with the life of the Virgin Mary, of which these two were the first and last of the series, whilst the Assumption of the Virgin appropriately occupied the centre. Those in the clerestory having disappeared, it has invariably been supposed that the two remaining at the ends of the aisles are those described by Ghiberti, although they differ in subject and entirely in style from his work. They are in fact thus mentioned in the archives:—"In 1414 Nicolo di Pietro della Magna painted the two windows on each side of the front of the cathedral," which record settles the question.

comer. He established furnaces by special permission, and it has therefore been hastily assumed that he manufactured colored glass; but these no doubt were to burn his painted glass. The letter inviting "Francescho Dominici Livi de Ghambasso comitatus Flor., magistro in omni et quocunque genere vitreorum de musayco et de quodam alio colore vitreorum," dated 15th October, 1436, was preceded by another written on the 26th August, 1434, which is thus recorded:—"Letter written to the master glass-painter Gambassi, then in Scotland, and who made works in glass of various kinds, and was held to be the best glass painter in the world." It is now vain to express the feeling with which Scotch people must regret the destruction of the works of this excellent artist in Holyrood Chapel; the blow then inflicted upon ecclesiastical art never has been remedied.

Many other glass-painters executed windows in the cathedral, the last of whom, Sandro di Giovanni Agolanti, in 1486 glazed the windows of the lantern, showing that it was finished, and in 1503 inserted glass "in an aperture for the astrologers to see the sun through." The windows of the cathedral of Florence are of rich deep colors, but unfortunately they are incrusted with dirt inside and outside. Many of them which have been broken have been wretchedly repaired, and the modern glass is toned with glazings of oil paint. They darken the church to such an extent that works of art within it are seen to disadvantage. Michelangelo's group of the Pieta is merely a dark mass, and it may be mentioned that his statue of Christ in Santa Maria sopra Minerva is similarly sacrificed to the painted glass lately introduced.

The history of glass painting is illustrated by windows in other churches in Florence; those in Santa Croce have been alluded to, with the exception of the magnificent circular window of the façade designed by Ghiberti. It is of special interest, as showing this great sculptor's ideas of color as well as of form. The subject is the Descent from the Cross, and the color strongly recalls the bright clear system of Fra Beato Angelico. In Santa Maria Novella there is another very fine circular window of the 14th century, the history of which seems to be forgotten; but in design it recalls the style of Andrea Orcagna, to whom also may be attributed the fragments of a window in the Strozzi chapel, which he partly painted in fresco, and for which he also provided the admirable altar-piece. In another Strozzi chapel in the same church, painted by Filippino Lippi in fresco, there is a very rich window which is obviously also of his design, but so completely has all critical knowledge of glass painting disappeared in Florence, that this and other noble works excite no attention and no remark, and are in danger either from removal or from the clumsiest renovation. The great window of the chancel, a large triplet, is so excellent that it places Sandro di Giovanni Agolanti in the foremost rank as a designer and glass-painter of the 15th century. He was born in 1446, and of his numerous works this superb triplet, which was erected in 1491–2, is the only example now remaining, whilst there are twenty-one records of his productions, evidently a small portion of them; the last describes him as decrepit in 1515, and mentions that Niccolo di Giovanni di Paolo, master glass-painter, took his place.

A window in St. Francis at Assisi by the Umbrian Angioletto da Gubbio, an artist of the early part of the 15th century, deserves special notice in connection with the admirable works of this great age of the art. It was erected about a century after the death of Cardinal Gentili (who built the chapel) by his heirs. The window is so full of light, so delicate in its arrangement of color, and so tenderly and skilfully painted, whilst the prevalent white ornament is so brilliant, that it is perhaps the most perfect type in existence of a painted window suitable for a building containing works of art, or where the climate is unfavorable and consequently the light imperfect. The close of the 15th century was in important respects the greatest epoch of painted glass in Italy: the general style of design of the great quattrocentista masters, their monumental and decorative methods of composition, simplicity of attitude and form, and rich unbroken color, were eminently adapted for reproduction in glass painting, whilst the prevalent style of ornament was singularly graceful and pleasing. The influence of the Italian style was felt in France, Germany, and the Low Countries, in which very noble works of glass painting rivalling the Italian were produced by eminent artists, examples of whose works may be seen at Bourges and Rouen, at Antwerp and Brussels, and in various cities in Germany, although, singularly enough, one of the finest typical examples of this great epoch of German glass painting exists at Assisi—the glazing panels of which the noble window has been composed being dispersed through two or three windows of the upper and lower church. The technical execution of the windows of this period in all these countries was superb, showing how thoroughly the artists were trained in every process of their art. In England the feeble Perpendicular style was contemporaneous, entirely devoid of good drawing, pallid in color, and weak in execution, a singular contrast in every respect to the state of the art on the Continent.

Amongst the most active and able glass-painters of the prolific 15th century in Italy the Gesuati monks, whose convent was close to Florence and was razed to the ground during the siege when Michelangelo aided in the defence of the city, were celebrated. They prepared colors for artists, supplying Michelangelo when he painted the Last Judgment, and they executed numerous windows of which there are records from 1467 to 1562. As glass-painters they painted the designs entrusted to them with forcible execution, but their drawing was less happy, and their ornamentation heavy. There are several windows by these Brethren in Florence: in Santo Spirito the great circle of the façade shows every indication of having been designed by Pietro Perugino; in San Salvatore, near San Miniato, the east window, evidently by a Gesuato, has very probably been designed by Andrea della Robbia. In another window in the same church a figure of St. John is a very fine specimen of their art. Several windows filled with small round panes of white glass, with richly colored borders and sacred monograms or heraldry in the centre, are especially noteworthy as admirable types for domestic architecture. There are also works of the same character as the above in the church of Santa Maria Maddalena dei Pazzi.

A glass-painter was now to make his appearance in Italy who was destined, although a foreigner, to eclipse in the opinion of the Italians all previous masters of the art; this was Fra Guglielmo di Marsillat, born in the diocese of Verdun in 1475. It is not known under whom he studied glass painting, but for protection from the consequences of some escapade he entered the Dominican order. Claude, an eminent French glass-painter, being summoned to Rome by Julius II. to decorate the Vatican with painted windows, induced Marsillat to accompany him. Of the numerous windows which they must have painted only two remain in the church of Santa Maria del Popolo, so complete has been the destruction of painted windows in the Eternal City. Marsillat executed a number of magnificent windows in his manner for the cathedral of Arezzo. The following is a form of contract made with him:—"The board of works of the cathedral have commissioned three windows of painted glass for the cathedral from Master William, son of Peter, Frenchman, that is, one window above the chapel of St. Francis, one window above the chapel of Matthew, one window above the chapel of St. Nicholas, for the price of fifteen livres the square braccio"—nearly 2 square feet,—"to be burnt in the fire and not painted in oil, and they are to be finished by the end of June, 1520." Marsillat, who painted well in oil and fresco, was the designer of his own windows. He was so impressed by the works of Michelangelo that he imitated his manner, and one of his windows at Arezzo, representing the Raising of Lazarus, is almost a transcript of the picture of the same subject designed by Michelangelo, and painted by Sebastian del Piombo, which is now in the National Gallery, London. The design of the Frenchman is rather more crowded, but is characterized by more life and action. He introduced into glass painting the magnificent architectural backgrounds, with figures on balconies and terraces, made familiar by the works of Paul Veronese; he drew the human figure admirably, and was very successful in the representation of motion, and his arrangement of color was perfect in harmony. It is not to be wondered at that his works produced so great an effect upon the minds of his contemporaries. They also show upon his part a consummate knowledge of technical conditions, and his windows are so perfectly executed that except where injured by violence or carelessness they are in admirable condition at the present time. Marsillat also executed some fine glass paintings at Cortona, which have been removed and are now in Florence.

Without entering upon the description of a considerable number of interesting works of glass painting in various parts of Italy, and of detailed notices of the artists, enough has been done to illustrate the history and progress of the art from the 13th century to nearly the first half of the 16th. Later much less colored glass came to be used, and a considerable change in taste took place in this art as in architecture; it is shadowed forth even as early as 1501 in the following record:—"Quod in dicto loco semper et pro omnia tempore in dicto loco et ecclesia sunt media die tenebre et ut vulgo dicitur buio et habeto colloquio cum consolibus Sancter Johannes de vietro faciat sumptibus opere unam finestram ex vitri cum ochi biacchi fregio d'allato et cum arme popoli." The desire for windows admitting more light led to the invention and adoption of a beautiful variety containing much white glass varied with yellow stain, and the introduction of a small quantity of colored glass. These windows were painted with graceful arabesques executed in enamels and burnt in, and they never have been surpassed at any time for excellence of drawing and skill of execution. Such are the windows in the Laurentian library at Florence, attributed to Giovanni da Udine, but erected after his death. Other examples might be referred to, and they are now of great value as showing the best description of ornamental window suitable for buildings of the developed Renaissance style, adorned with works of painting and sculpture. They have enough of color to harmonize them with painted decorations, and enough of white glass not to destroy the chiaroscuro of sculpture. It should be remembered that the 13th century produced beautiful windows possessing similar advantageous qualities suitable for mediæval buildings containing modern sculpture, such as the famous five sisters of York cathedral, or the white windows of the same period at Chartres.

The technical execution of the glass paintings still existing in Italy resembles that prevalent elsewhere, and the method of the old masters is clearly described by Theophilus. The glass used was either pot metal or coated; that is, the color either pervades the whole body of the metal or is applied as a film over white glass, invariably the case with ruby, which would seem black but for this contrivance. The artist employed to design a window prepared a full size working drawing, which, according to Theophilus, was executed on a whitewashed board in his time; but later these were made on paper, as is proved by the following contract from the archives of the cathedral of Florence (1437):—"To Lorenzo di Bartoluccio (Ghiberti), sculptor, seven florins, being the half of the price of his skill and labor for drawing four figures on paper of bombagia (coarse cotton) for a window to be executed by Bernardo di Francesco, glass-painter, at three livres per figure." Guided by the firmly marked outlines, the glazier cut his mosaic of glass of the requisite colors by the aid of a hot iron, the diamond not being used for this purpose till the 17th century. The pieces of glass were further reduced to the shapes and sizes needed by the aid of the grosing iron, still a familiar instrument; thus prepared they were ready for the painter, and at the present time are attached to a transparent easel formed of a large sheet of glass. Theophilus thus describes the enamel color prepared for painting with:—"Take copper beaten small, burn it in a little pipkin until it is entirely pulverized, then take pieces of green glass and sapphire" (a blue paste used in mosaic work), "and pound them separately between two porphyry stones; mix these ingredients together in the proportions of one-third powder, one-third green glass, and one-third sapphire. Grind them on the same stone with wine or urine, put them into an iron or leaden vessel, and paint the glass with the utmost care. For with the three colors" (that is, shades of one color), "if you are diligent in the work, you can make the lights and shadows of the draperies in the same manner as in colored painting. When you have laid on the first touches in the drapery with the aforesaid color, spread it in such a manner that the glass may be pure" (that is, untouched) "in that part which you are accustomed to make light in a picture, and let the touches be dark in one place and light in another" (that is, graduated), "and again yet lighter and distinguished with much care, that it may appear as if three shades of color had been applied. This order you should observe below the eyebrows, and round the eyes, and nostrils, and chin, round the naked feet and hands, and other portions of the naked body; and thus let the glass painting have the appearance of a painting composed of many colors." It must be obvious from this description of the most ancient method of glass painting, in important respects the same as that still followed, that the art is regulated by certain necessary conventions distinguishing it from painting upon opaque surfaces. The features and accessories are drawn with sharp black lines making them out clearly to be seen at a distance, and in a very different way from the representation of such details in a picture. The highest lights are the local color, that is, the pure color of the glass; the deepest shadows are solid black produced by laying on the enamel thickly; all this is precisely the reverse of the system pursued at the same early period in painting pictures in which the shadows were the local color and the lights white. As painting advanced it gradually approached more nearly to the scale of color of the glass-painter, the lights instead of being white were painted of appropriate shades of the local color, and the shadows were graduated into black in their deepest parts. It may have been that glass painting suggested this important change in ideas of color and chiaroscuro. The glass being painted as described must be burnt to fix the enamel thereon with its flux. The separate pieces with the painted side upwards are placed upon the shelves of a kiln or iron box, covered with whiting; the kiln is placed in a brick oven, and a fire kindled which surrounds it with flames. Much experience is needed to determine when the glass is sufficiently burnt to fix the enamel. When this has been done the fire is withdrawn, the oven is hermetically sealed, and the glass is left to cool gradually, so as to be annealed. From the appearance of many Italian windows as compared with those executed elsewhere, it is reasonable to infer that the Italians were less skilful than their northern contemporaries in firing their glass. The next process is to unite the numerous pieces of mosaic, thus painted and burnt, into panels of a given size, which is done by means of ribbons of lead grooved on both sides, the ribbons being soldered at all their angles, thus firmly tying the mosaic together. When the painted window is erected, the leads are seen internally in contrast with the transparent glass as intensely black lines, but externally, where they catch the light, as meandering lines of metal dividing the surface. Mistaken attempts have repeatedly been made to get rid of these lines, but they are constituent parts of the art, can only be got rid of by changing its true character, and are only disfiguring when injudiciously introduced, as for instance in some 14th-century glass in Santa Croce, in which the whites of the eyes are fixed with leads of the form of spectacles, so that all the saintly persons represented appear, ridiculously enough, to wear these aids to defective vision. The panels, which are technically called glazing panels, are inserted in their places in the windows by means of grooves prepared in the stone work, into which they are secured with cement and strengthened at intervals with cross-bars of iron called saddle bars, to which the glass is made fast by ties of copper wire. Thus fixed, experience has shown that painted windows if duly cared for will last for many centuries. Regarded in their connection with past history, no monuments of art surpass painted windows in interest; they are only equalled by the paintings still extant in the tombs of the Egyptians as illustrations of faith, history, and customs. It was almost the universal usage that persons of every rank and position, as well as corporate bodies and guilds, made offerings of painted windows to churches. Whilst they give the most vivid ideas of ancient taste and methods of decoration, the religious opinions of successive ages are interpreted by the manner in which sacred subjects are selected or represented; the actual state of art at different times, from its rudest forms to the most perfect, is admirably exemplified; and, as it was customary to introduce the donors in appropriate parts of their gifts, the prince or noble in knightly panoply, with his armorials, is seen kneeling, sometimes accompanied by his spouse. In like devout attitude the ecclesiastic appears in the robes and with the insignia of his office, or the wealthy merchant and his wife in appropriate costume. In other examples tradesmen, surrounded with the objects and materials of their commerce, sell to their customers articles of clothing or of food. Every occupation is illustrated in these ancient pictures in glass. How great then has been the loss to art and history caused by the reckless demolition of painted glass which has taken place in all parts of Europe, but especially in Italy, where the clergy have been the chief offenders! The Italians have not been impelled to this lamentable destruction of

these precious records and beautiful creations by any of the convictions, changes of faith, or fanaticism, fatal to so many works of art in other countries, but by unreasoning transformations of taste, by ignorance, or by the paltry desire of gain. In northern climates ancient glass is found to have been affected by the action of the weather, its outside surface is roughened and pierced to a small depth by little pits, or is so altered as to resemble sheets of zinc; it is also covered with dirt, especially internally, the enamel rougher than the surface of the glass favoring this incrustation. These injuries and accumulations veil the glass paintings, and produce a mysterious confusion of form and color, admired by many, who to obtain in modern work such effects of age, and to conceal the inharmonious crudity of color, soil it artificially with varnish, paint, or enamel applied externally, or with dirt applied of set purpose, showing thereby their ignorance of art and their bad taste, by having recourse to processes which are outside the domain of art, for perfect harmony of color and effect of chiaroscuro ought to be the results of the artist's cultivated knowledge and skill, and nothing should be done to hasten the obscuration of the windows or to anticipate the effects of time. Important improvements have been made in the art of glass-painting, as well as in the manufacture of glass, since Theophilus wrote his treatise, but some of these have not been favorable to the art; for instance, old glass is much quieter in color than modern, and as it was less diaphanous, and less smooth in texture, it was better adapted to the operations of the glass-painter. This being observed, eminent manufacturers of colored glass in England and on the Continent have prepared imitations of the soft, pleasing hues of old glass, and of its varied texture, with considerable success. The addition of an enamel brown from iron, and much warmer in tone than that made from copper, has been an important aid to glass painting, whilst about the middle of the 16th century numerous colored enamels were invented, which, however ingenious and beautiful, subsequently modified the art unfavorably. Vehicles composed of spirits of turpentine, fat turpentine, or gum senegal have advantageously replaced the primitive distempers already alluded to. An important addition was the discovery of the yellow stain, made from silver, the only purely transparent color applicable to the surface of glass. It has been described as the invention of the Beato Giacomo of Ulm, who practised glass painting at Bologna, and died in the odor of sanctity in 1491; but the yellow stain was characteristic of glass paintings for more than a century before his time. The introduction of the system of coating white with colored glass in the same way as it had been coated with ruby glass, and the invention in the 15th century of removing portions of the colored glass by abrasion, or with the wheel so as to lay the white bare in conformity with special designs, together with the practice of staining such white portions yellow, led to important modifications in the art. Embroideries on colored garments and other ornaments were thus easily represented, and the system is very useful in painting heraldry. Instead of the wheel fluoric acid is now chiefly used to remove the film of colored glass from its white backing. The leads with which the mosaic of glass is brought together in glazing panels have undergone various changes. Early leadwork is massive; but at the beginning of the 15th century it becomes lighter in appearance but without loss of strength, for although the grooves were made shallower, the lead was increased in thickness and was rounded on the outer surfaces. Alterations also were made in the method of fixing painted windows: the saddle bars, according to climate, were made more or less robust; and, instead of crossing the windows in straight horizontal lines, they were frequently bent to suit the design. Generally speaking, horizontal bars are not objectionable unless they cross faces, or hands, and feet,—an arrangement which ought carefully to be avoided. Mosaic windows should be made waterproof, and the saddle bar should be painted at intervals of time, as otherwise the rust injures the glass.

Enamelled glass, that is to say, white glass enamelled with colors, finally took the place of mosaic glass. In England in the last century glass-painters of merit who practised enamel painting have left considerable works, amongst whom Francis Eginton, Forrest, Henry Giles, Robert S. Godfrey, Jarves, and especially Jervais, who in 1717 executed from designs by Sir Joshua Reynolds the great east window of New College, Oxford. Whatever may be thought of their method, these glass-painters were meritorious artists. Reference has been made to some of the works of the admirable glass-painters of other countries besides Italy, but the object of the present paper has been to illustrate the history and practice of the art by Italian specimens hitherto little observed, and very inadequately and generally inaccurately described.

At the present time the art of glass painting is practised in different countries with very divergent views of its character and limits. Some think that the more nearly it can be assimilated to pictures in oil or fresco the better, whilst others maintain that all such resemblance is beyond its distinctive conditions as a branch of decorative art. It is a common but erroneous belief that the art of glass painting was lost, and that it has been revived in the present century. It survived in its latest form of the enamel method, classed by Mr. Winston as the intermediate style, which is still carried out with unsurpassed skill in Germany. Undoubtedly the mosaic system had disappeared, and it has been judiciously and ably restored wherever glass painting is now common, although with different modifications and ideas of its nature. In England glass-painters possessed of much technical skill and cultivated knowledge of old forms of the art, have produced meritorious works within the limits of almost servile imitation, insisted upon by prevalent but mistaken sentiment; and in too many instances this imitation has reduced the art to the state of mere trade, so that at no period of its history have worse specimens been executed, too often found in the windows of the grandest monuments of mediæval architecture, which ought to have been preserved from such profanation. Of the great value and interest of early painted windows, as well as of those of more matured art, every one who studies them with intelligence must be sensible; and this value and interest are increased by the fact that they illustrate, with perfect truth, the tastes and ideas, the faith and customs, of the periods during which they were created, but modern counterfeits do nothing of the kind, and can convey no such impressions to future times. It is only by the restoration of the old union which existed between the great artist and the glass-painter, dwelt upon in these columns, that the beautiful art of glass painting can be really restored, nor are we without a completely successful instance of the happy results of this union. A window in the parish church at Alnwick, designed by the late William Dyce, R. A., and painted on glass at Munich, is a magnificent specimen of the art, equal in design and execution to the works of its golden age.

In Germany the arts ornamental still flourish as branches of fine art. There, as generally throughout the Continent, the acquirement of a knowledge of ornament forms part of the curriculum of study of most artists; to the entire neglect of this in England, in academies of fine art, may be attributed the low estate into which these branches have fallen. The most eminent German artists of the present century have made designs for painted windows, which have been executed by highly-trained glass-painters, with that care which is so characteristic a national attribute. Such being the case, it remains a source of wonder that artists surrounded by precious remains of ancient genius remarkable for exquisite color should, notwithstanding, show so little ability as colorists. They assimilate the colored glasses of the best qualities, with every attention to the laws of harmony, but they do not bring them into union as the old masters did by forcible painting of the shadows and half tints. The shadows generally are too transparent, and the general effect is weak. The finest work of the Munich school of glass painting, and one of the best windows produced in the present century, is in the Parliament House, Edinburgh. It is richer in color than is usual; and, having been designed by the illustrious Wilhelm von Kaulbach, the general composition is of a noble character.

In France an imitative school, resembling that which has been dominant in England, has executed skilful mimicries of ancient glass painting, and has restored successfully ancient windows broken or otherwise injured in revolutionary times or by neglect. Glass-painters of this class may be found in France, who dispute the supremacy in bad art of their island rivals. In efforts to escape from this abject imitation, trained artists have produced original works of considerable power of form and color, but too many aim at a picturesque eccentricity, and an affected design, inconsistent with the grave beauty of the art; and Jean Cousin and other great masters of the grand period of French glass-painting have no successful followers, nor has any painted

window been produced in France in the present century which equals that by the Scottish artist, William Dyce, or that by the German, Von Kaulbach.

In Italy there are glass-painters whose merits as draughtsmen, designers, and executants place them in the first rank, but their windows are almost invariably laborious imitations of pictures in oil; they have undoubtedly lost the methods as well as the ideas and style of their great predecessors, whose windows they not unfrequently injure deplorably by their restorations. It is to be regretted that artists so admirably trained in many respects should so little comprehend the magnificent works of former times which would be their best models, and which they have skill enough to rival but for their vicious method of execution.

In Belgium the art is practised with considerable skill, and works of merit have been executed, but here, as elsewhere, the modern glass-painter is inferior to his predecessors, although he is surrounded by so many admirable specimens of ancient art.

The following works on glass painting may be advantageously studied:—Ferdinand de Lasteyrie, *Histoire de la peinture sur verre d'après ses monuments en France*, Paris, 2 vols. folio, 1852; Id., *Quelques mots sur la Theorie de la peinture sur verre*, Paris, 12mo, 1853; Id., *Notice sur les vitraux de l'abbaye de Rathausen, canton de Lucerne*, Paris, 1856; A. Lenoir, *Histoire de la peinture sur verre et description des vitraux anciennes et modernes*, etc., Paris, 1803; Id., *Notice historique sur l'ancienne peinture sur verre, sur les moyens pratiques dans cet art depuis l'époque de son invention jusqu'a nos jours, et par suite sur Jean Cousin, qui a excellé dans le même art*, Paris; E. H. Langlois, *Essai historique et descriptif sur la peinture sur verre ancienne et moderne*, Rouen, 1832; Pierre le Vieil, *L'art de la peinture sur verre et de la vitrerie*, Paris, 1774; *Glass: the manner howe to anneile or paint in glass: the true receptes of the cullors*, 1616; Gessert, *Rudimentary Treatise on Painting on Glass*, London, 1851; Mrs. Merrifield, *Ancient Practice of Painting in Oil, Miniature, Mosaic, and on Glass*, etc., London, 1849; Charles Winston, *An Inquiry into the difference of style observable in ancient Glass Painting, especially in England*, Oxford, 1847; Padre L. V. Marchese, *Memorie dei piu insigni Pittori, Scultori, e Architetti Domenicani*, Florence, 1846; G. Gaye, *Carteggio inedito d'artisti dei secoli* xiv., xv., xvi., 3 vols., Florence, 1839; Gaetano Milanesi, *Le Opere di Georgio Vasari con nuove annotazioni e commente*, Florence, 1879. (C. H. W.)

GLASSIUS, Solomon (1593–1656), theologian and Biblical critic, was born at Sondershausen, in the principality of Schwarzburg-Sondershausen, in 1593, received his school education at the gymnasium of Gotha, and in 1612 entered the university of Jena, where, with the exception of some months spent at Wittenberg in 1615, he passed the following nine years of his life. As a student of theology under John Gerhard he directed his attention especially to Hebrew and the cognate dialects; in 1619 he was made an "adjunctus" of the philosophical faculty, and some time afterwards he received an appointment to the chair of Oriental languages. From 1625 to 1638 he discharged the duties of superintendent in Sondershausen; but in the latter year, shortly after the death of Gerhard (1637), he was, in accordance with the last wish of that great man, appointed to succeed him in the chair of theology at Jena. He did not, however, continue long at that university; for in 1640, at the earnest invitation of Duke Ernest the Pious, he removed to Gotha, there to act as general superintendent in the execution of important reforms which had been initiated both in the ecclesiastical and in the educational establishments of the duchy. The delicate duties attached to this office he discharged with singular tact and energy; and when called upon to take part in what is known as the "syncretistic" controversy, by which Protestant Germany was so long vexed, he manifested a combination of firmness with liberality, of loyalty to the past with a just regard to the demands of the present and the future, which unhappily have only too seldom been equalled in theological disputes. His principal work, the well known *Philologia Sacra*, published originally in 1625, was and still is regarded as a work of great value in biblical hermeneutic; and it has an historical importance as marking the transition from the earlier views on questions of biblical criticism to those of the school of Spener. It was more than once reprinted during the author's lifetime, and appeared in a new and revised form, edited by Dathe and Bauer at Leipsic, towards the close of the century (1776–1797). Glassius succeeded Gerhard also in the editorship of the Weimar *Bibelwerk*, and he wrote the commentary on the poetical books of the Old Testament for that publication. A volume of his *Opuscula* was printed at Leyden in 1700. He died in 1656.

GLASTONBURY, a market town and municipal borough of England, is situated near the middle of Somersetshire, about 22 miles S. W. of Bath, on the great western road from London to Exeter. The spot occupied by the town is a sort of peninsula formed by the windings of the river Brue, which flows west through the valley between the Poldew and the Mendip Hills; and in earlier times it was to all intents an island, as the country round was an extensive marsh, broken, however, by the Tor of St. Michael to the N. E. of the town. Of the public buildings the most important, besides the ruins of the great abbey, are the church of St. John the Baptist, in the Perpendicular style, with a tower of fine proportions; the church of St. Benedict, dating from between 1493 and 1524; the hospital of St. John, founded in 1246; and the George Inn, erected about the time of Henry VII. or Henry VIII. There was formerly in the town a remarkable cross, which is figured in Warner's *Glastonbury;* but it fell into decay, and was replaced by the present insignificant monument in 1846. Though Glastonbury has a station on the Somerset and Dorset Railway, and communicates with the estuary of the Severn by means of a canal for vessels of 70 or 100 tons burden, it has comparatively little trade. The woollen manufacture was introduced by the duke of Somerset in the first half of the 16th century, as may be seen at length in Strype's *Life of Cranmer;* but neither that nor the manufacture of silk, which was also carried on to some extent during the 18th century, is now of any importance. There are tanneries, however, and tile-works. The population of the town in 1861 was 3496, and in 1901 it was 4,116.

The abbey of Glastonbury is without doubt one of the very earliest ecclesiastical foundations in England. In the words of Mr. Freeman ("King Ine," *Proc. of Somersetshire Arch. Soc.*, 1874), "it is on any showing a tie between the Briton and the Englishman, between the older Christianity of our island and the newer, the one church of the first rank which lived through the storm of English conquest, which passed into the hands of our victorious fathers as a trophy of victory undestroyed and unplundered." But unfortunately "everything relating to its early history is so enveloped in legend that one has to tread one's way with the greatest caution at every step." As Canon Stubbs remarks,[1] the extravagant claims of the monks in regard to the antiquity and celebrity of their church "doubtless provoked criticism, and criticism forced on them the need of a forged history to assert, and of forged monuments to support these pretensions. The fabrication of such evidence must have gone on at Glastonbury on a scale proportioned to the claims; and William of Malmesbury, it would almost seem, undertook to erect the story out of materials which he distrusted. This did not content his employers, and they interpolated his work to a degree which makes it impossible to rely with confidence on any part of it."

Though Glastonbury is not mentioned either by Bede or by the authors of the Saxon Chronicle as one of the early foundations, its existence (continues Prof. Stubbs) is proved by the incontrovertible authority of the letters of St. Boniface and the life of the same by S. Willibald. The name of Glastonbury, however, is of comparatively modern origin, being a corruption of the Saxon *Glæstingaburh* or town of the Glæstings. By the Britons the spot seems to have been called Ynys yr Avallon (Latinized as Avallonia), the Island of Apples, or Ynyswitrin, the Glassy Island; and it became the local habitation of various fragments of Celtic romance.

According to the legends which grew up under the care of the monks, the first church of Glastonbury was a little wattled building erected by Joseph of Arimathea as the leader of the twelve apostles sent over to Britain from Gaul by St. Philip. About a hundred years later, according to the same authorities, the two missionaries Phaganus and Deruvianus who came to king Lucius from Pope Eleutherius established a fraternity of anchorites on the spot, and after three hundred years more St. Patrick introduced amongst them a regular monastic life. About 546 David of Menevia is said to have built a new church near the old one, and in the 7th century the old one was encased with boards and covered with lead by the care of Paulinus of York. In the early part of the 8th century the great West Saxon king Ine (*cf.* charter in Kemble, *Codex diplomaticus ævi Saxonici*, vol. i. No. lxxi.) built and endowed a monastery at Glastonbury, which, in spite of the preceding establishments, may almost be considered as a new foundation. From the decadent state into which, like other monasteries, Glastonbury was brought by the Danish invasions, it was brilliantly recovered by the powerful hand of Dunstan, who had been educated within its walls and was appointed its abbot about 946. The church

[1] *Introduction to Memorials of St. Dunstan, Rolls Series*, 1874.

and other buildings of his erection remained till the installation, in 1082, of the first Norman abbot, who inaugurated the new epoch by commencing a new church. His successor Herlewin (1101–1120), however, dissatisfied with the meanness of the edifice, pulled it down to make way for a finer structure. Henry of Blois (1126–1172) added greatly to the extent of the monastery, building a bell tower, a chapter-house, a cloister, a dormitory, a refectory, a palace, a brew-house, etc. In 1184 (on 25th May) the whole of the buildings were laid in ruins by fire; but Henry II. of England, in whose hands the monastery then was, entrusted his chamberlain Rudolphus with the work of restoration, and caused it to be carried out with much magnificence. The great church of which the ruins still remain was then erected. In the end of the 12th century, and on into the following, Glastonbury was distracted by a strange dispute, caused by the attempt of Savaric the ambitious bishop of Bath to make himself master of the abbey. The conflict, carried on alternately by blows and bribes, was brought to a close by the decision of Innocent III., that the abbacy should be merged in the new see of Bath and Glastonbury, and that Savaric should have a fourth of the property. On Savaric's death his successor gave up the joint bishopric and allowed the monks to elect their own abbot. From this date to the Reformation the monastery continued to flourish, the chief events in its history being connected with the maintenance of its claims to the possession of the bodies or tombs of King Arthur and St. Dunstan. As early at least as the beginning of the 11th century the tradition that Arthur was buried at Glastonbury appears to have taken shape; and in the reign of Henry II., according to Giraldus Cambrensis and others, the abbot Henry de Blois, causing search to be made, discovered at the depth of 16 feet a massive oak trunk with an inscription "Hic jacet sepultus inclitus rex Arthurus in insula Avalonia." After the fire of 1184 the monks asserted that they were in possession of the remains of St. Dunstan, which had been abstracted from Canterbury after the Danish sack of 1011 and kept in concealment ever since. The Canterbury monks naturally denied the assertion, and the contest continued for centuries. In 1508 Warham and Goldston having examined the Canterbury shrine reported that it contained all the principal bones of the saint, but the abbot of Glastonbury in reply as stoutly maintained that this was impossible. The day of such disputes was, however, drawing to a close. On 1539 the last and 60th abbot of Glastonbury, Robert Whyting, was, in the words of a contemporary letter (MS. Cotton, Cleop. E., iv. fol. 996), "arraigned, and next day put to execution for robbing of Glastonbury church." His body was quartered, and his head fixed on the abbey gate. A darker passage does not occur in the annals of our English Reformation than this murder of an able and high-spirited man, whose worst offence was that he defended as best he could from the hand of the spoiler the property of his charge.[1]

The ruins of the abbey are now comparatively few, and as the work of destruction has in many places descended to the very foundations it is impossible to make out the details of the plan. Of the vast range of buildings for the accommodation of the monks almost nothing remains except the abbot's kitchen, noteworthy for its octagonal interior, the porter's lodge, and the abbey barn. Considerable portions are still standing of the so-called chapel of St. Joseph at the west end, which Mr. Willis has identified with the lady chapel, occupying the site of the old wicker church. This chapel, which is the finest part of the ruins, is transition work of the 12th century. It measures about 66 feet from east to west and about 36 from north to south. Below the chapel is a crypt which Professor Willis shows to be a construction of the 15th century inserted in a building which had no previous crypt. Between the chapel and the great church is an Early English building which appears to have served as a Galilee porch. The great church itself was a cruciform structure with a choir, a nave, and transepts, and a tower surmounting the centre of intersection. From east to west the length was 410 feet, and the breadth of the nave was about 80 feet. The nave had ten severies, and the choir six. Of the nave three bays of the south side are still standing, and the windows have pointed arches externally and semi-circular arches internally. Two of the tower piers and a part of one arch give some indication of the grandeur of the building. The old clock, presented to the abbey by Adam de Godbury (1322–1335), and noteworthy as the first recorded example of a clock striking the hours automatically with a count-wheel, is still preserved, although not in its entirety, in the cathedral at Wells.

The Glastonbury thorn, planted, according to the legend, by Joseph of Arimathea, has been the object of considerable comment. According to Loudon (*Arboretum et Fruticetum*) it was probably *Cratægus præcox*, and he reports that he received from Glastonbury, in December, 1833, a thorn branch in full blossom, having also on it ripe fruit. The actual thorn visited by the pilgrims was destroyed about the Reformation time, but specimens of the same variety are still extant in various parts of the country.

[1] A curious relic of Abbot Whyting, his watch, was purchased in 1837 at the sale of T. Bowen's effects, and presented by C. K. Tynte to the duke of Sussex.

GLATZ (Slav. *Kladsko*), a fortified town of Prussian Silesia, chief town of a countship in the government district of Breslau, is situated 50 miles S. S. W. of the town of that name. It stands in a narrow valley on the left bank of the Neisse, not far from the Austrian frontier. It is strongly walled, and is further defended by an old castle built on a high hill on one side of the town, and by a regular modern fortress erected on a hill on the opposite side. Before the town on both banks of the river there is also a strongly fortified camp, by which its bombardment from the neighboring heights may be hindered, and which affords accommodation for as many as 10,000 men. The town is the seat of a circle court and of an agricultural union, and possesses one Lutheran and three Catholic churches, one of which is very old and contains several monuments of Silesian dukes. Among the other buildings the principal are the nunnery, the royal Catholic gymnasium, the asylum for destitute children, and the military hospital. The industries include the manufacture of spirits, linen, damask, broadcloth, hosiery, beads, and leather. Glatz existed as early as the 11th century. In the Thirty Years' War it was several times besieged and taken. It surrendered to Frederick the Great in 1742, was retaken by the Austrians in 1760, and was restored to Prussia at the peace of 1763. The population in 1905, 16,052.

GLAUBER, Johann Rudolph (1603–1668), alchemist and medicinal chemist, was born at Carlstadt in 1603, and died at Amsterdam in 1668. There is no authentic record of details concerning his life; his name has been somewhat marred by tradition, but it is not unreasonable to suppose that this originated with persons who did not heed the warning given by the chemist himself, in one of his more important memoirs, "let no one rashly judge of this work, until he be thoroughly informed concerning the same." Commencing his career as a chemist at the time he did, it was not unnatural that he imbibed the notion, prevalent among his contemporaries, of the existence of "alkahest," a liquid which was to be universal in its uses as a solvent and a medicine, and of the "philosopher's stone." But whatever the motive which induced him to toil in his laboratory, it is certain that he, by ascertaining the preparation of many valuable medicines, contributed largely to pharmacy. He undoubtedly was the first, in 1648, to procure hydrochloric acid by the action of oil of vitriol on common salt, and also in all probability to obtain nitric acid by means of oil of vitriol and nitre. Sodium sulphate, discovered by him, and commonly therefore termed Glauber's salt (see below), he obtained by the action of oil of vitriol on salt.

His treatises, about thirty in number, were published at Frankfort in 2 vols. 4to, in 1658–1659; at Amsterdam, in 1661, in 7 vols. 8vo; and at London, translated into English by Parke, in 1689, 1 vol. folio.

GLAUBER'S SALT, the popular term for neutral sulphate of sodium ($Na_2SO_4$), discovered by the chemist whose name it bears, and formerly known as "sal mirabile Glauberi." It occurs in nature in combination with calcium sulphate as the mineral glauberite, and uncombined in right rhombic prisms, as thenardite, being found in this form in Bolivia and Peru, and near Madrid; or in monoclinic prisms, with ten molecules of water as glauberite or ordinary Glauber's salt, in Austria, Hungry, Italy, and in great quantity as a deposit from the hot springs of Carlsbad. It

is also a constituent of sea-water, and the chief active principle of medicinal waters, and occurs in minute traces in the blood. It has a bitter but not acrid taste. It is somewhat anomalous in its solubility, the maximum occurring at about 34° C. According to Löwel, it exists in aqueous solution at temperatures as high as 34° C. as a decahydrate, but above that temperature as an anhydride, the solubility of the former increasing, and of the latter decreasing, with a rise of temperature (see CHEMISTRY, vol. v. p. 438). Under ordinary circumstances it crystallizes from solution in large colorless prisms; these, when exposed to the air or heated, effloresce, giving a white powder, which melts at a strong red heat, and on cooling forms a transparent mass. The salt has also been the subject of some interesting experiments made by Guthrie, who at −7° C. procured it in combination with 166 molecules of water. From his investigation of this and other substances, he concluded that the solution of a solid body consists in the formation of a liquid hydrate which ultimately diffuses into the rest of the solvent. In the manufacture of sodium carbonate from salt and sulphuric acid, this sulphate is prepared in large quantities. In medicine it is employed as a purgative.

GLAUCHAU, one of the most important manufacturing towns of Saxony, circle of Zwickau, is situated on the right bank of the Mulde, 7 miles north of Zwickau and 17 west of Chemnitz. It is the seat of a royal administrative commission, of a district court, and of the ecclesiastical and secular courts of the countship of Schönburg. Its principal manufactures are woollen and half-woollen goods, in regard to which it occupies the first position in Germany. Besides 3000 hand-looms and 1000 power-looms in the town, the trade gives employment to many others in the neighboring districts. There are also dyeworks, printworks, and manufactories of paper, linen, thread, and machinery. Glauchau possesses a real school, an elementary school, a weaving school of the higher grade, an orphanage, and an infirmary. Some portions of the extensive old castle date from the 12th century, and the Gottesacker church contains interesting antiquarian relics. Glauchau was founded by a colony of Sorbs and Wends, and belonged to the lords of Schönburg as early as the 12th century. The mineralogist Agricola was born at Glauchau in 1494. While the population in 1834 was only 6292, it was 14,357 in 1858, and 24,596 in 1905.

GLAUCUS (Γλαῦκος, *i. e.* γλαυκός, "silvery" or "sheeny"), in Greek mythology, the name of several figures, the most important of which are the four described below:—

(1.) GLAUCUS, surnamed Pontius (ὁ πόντιος, equivalent to ὁ θαλάσσιος), according to the common legend had originally been an expert fisherman and diver at Anthedon (Bœotia), but having eaten of the magical herb sown by Cronos, had leapt into the sea, where ultimately he was changed into a god, and endowed with the gift of unerring prophecy. A principal seat of his cultus was Anthedon, where the inhabitants claimed to be descended from him; but he was also worshipped extensively, not only on the coasts of Greece, but also on those of Sicily and Spain, it being customary for fishermen and sailors at certain seasons to watch during the night for the moment when he should come on his periodical rounds accompanied by his train, in order that they might consult him as an oracle. He is generally represented as endowed with most of the attributes of Nereus, but occasionally he is identified with Melicertes. He is sometimes said to have instructed Apollo in prophecy. In art he is depicted as a vigorous old man with long hair and beard, his body terminating in a scaly tail. The *Argonautica* represent Glaucus as having been builder and steersman of the "Argo," as having alone remained unhurt in the fight of Jason with the Tyrrhenians, and as having afterwards become a sea-god, in which capacity he was able in various ways to assist the expedition. A poetical account of his metamorphosis is given by Ovid (*Met.*, xiii. 906), and his story has been also treated by Pindar and by Æschylus, the latter of whom is known to have made Glaucus Pontius the subject of one of his satyr-dramas (see Pausanias, ix. 22, 6; and compare Hermann, *De Æschyli Glaucis*). Allusions to the loves of Glaucus with Ariadne, Scylla, the Nereids, and Melicertes are frequently to be met with in ancient literature; and a considerable quantity of folklore concerning him will be found in the scholiast on Plato's *Republic*, p. 536, and also in Athenæus, *Deipnosoph.* vii. 47, 48. See also Gädechen's monograph (*Glaukos der Meergott*, 1860).

(2.) GLAUCUS, usually surnamed Potnieus (ὁ ποτνιεύς), from Potniæ near Thebes, a deity worshipped chiefly in Corinth, is to be carefully distinguished from Glaucus Pontius. He was the son of Sisyphus by Merope, and the father of Bellerophon. According to the legend he was destroyed by his own mares,—the most common form of the story being that he was torn to pieces by them. Accounts differ as to the place of his violent death, and also as to the immediate occasion of it. Sometimes it is represented as having happened at Iolcus, at the funeral games of Pelias, but usually the scene is laid at Potniæ. He is most frequently represented as having offended Aphrodite by having kept his mares from breeding; but other versions of the myth are that he had fed them on human flesh to make them more spirited, or that they had been suffered to drink at a sacred well at Bœotia, or that they had eaten the herb hippomanes. On the isthmus of Corinth, and also at Olympia and Nemea, he was worshipped as ταράξιππος; and he was the subject of a lost tragedy of Æschylus. His affinities with Poseidon Hippius are obvious; and it may be taken for granted that the frantic horses of Glaucus Potnieus represent the stormy waves of the sea, just as Glaucus Pontius is himself a personification of the ocean in its friendlier and calmer moods.

(3.) GLAUCUS, the son of Minos by Pasiphae, when a child, playing at ball or pursuing a mouse, fell into a honey pot and was smothered. His father, after a vain search for him, consulted the oracle, and was referred for an answer to the person who should suggest the aptest comparison for one of the cows of Minos which had the power of assuming three different colors. Polyidus (Πολύϊδος) of Argos, who had likened it to a mulberry (or bramble), which changes from white to red and then to black, soon afterwards discovered the child. Minos then desired him to restore young Glaucus to life; and on his failure in this, he was sentenced to be entombed alive along with the corpse. Having in the sepulchre killed a serpent by which he had been attacked, he saw its companion revivify it by laying upon it a few leaves of a certain herb. The same herb he successfully applied to Glaucus. This curious myth is now very generally admitted to be of a solar character; but interpreters are far from unanimous as to the significance of the various details. The story, which is related by Apollodorus (iii. 3, 1), and also by Ælian, was a favorite subject with poets and artists. Æschylus, Sophocles, and Euripides are each of them said to have treated it dramatically; and, according to Lucian, it was often represented in mimic dances (Lucian, *De Saltatione*, 49; Welcker, *Die Griech. Tragoedie*). In some of its features at least the mythus is found to be very widely diffused. See Cox, *Aryan Mythology*, i. 161; Baring-Gould, *Myths of the Middle Ages*, ii. 145.

(4.) GLAUCUS, son of Hippolochus, and grandson of Bellerophon, mythical progenitor of the kings of Ionia, was a Lycian prince who, along with his brother Sarpedon, assisted Priam in the Trojan war. The incident between Glaucus and Diomede, as related in the *Iliad*, is well known. He was afterwards slain by Ajax; but his body was carried back to Lycia, as that of his brother had been. It seems probable that these two sons of the Lycian land—the land of light—who leave it in youth, but are carried thither again (by Hypnos and Thanatos) when their course is done, originally were meant to represent respectively the creeping light of the early dawn (Sarpedon) and the brightness of the open day (Glaukos).

GLEBE, in ecclesiastical law, is the land devoted to the maintenance of the incumbent of a church. Burn (*Ecclesiastical Law*, *s. v.* "Glebe Lands") says:—"Every church of common right is entitled to house and glebe, and the assigning of them at the first was of such absolute necessity that without them no church could be regularly consecrated. The house and glebe are both comprehended under the word *manse*, of which the rule of the canon law is, *sancitum est ut unicuique ecclesiæ unus mansus integer absque allo servitio tribuatur.*" In the technical language of English law the fee-simple of the glebe is said to be in *abeyance*, that is, it exists "only in the remembrance, expectation, and intendment of the law." But the freehold is in the parson, although at common law he could alienate the same only with proper consent,—that is, in his case, with the consent of the bishop. The disabling statutes of Elizabeth (1 Eliz. c. 19, and 13 Eliz. c. 10) made void all alienations by ecclesiastical persons, except leases for the term of twenty-one

years or three lives. As to exchange of glebe lands see 5 and 6 Vict. c. 54, and 17 and 18 Vict. c. 84. In Scotch ecclesiastical law, the manse now signifies the minister's dwelling-house, the glebe being the land to which he is entitled in addition to his stipend. All parish ministers appear to be entitled to a glebe, except the ministers in royal burghs proper, who cannot claim a glebe unless there be a landowner's district annexed; and even in that case, when there are two ministers, it is only the first who has a claim. See Bell's *Dictionary and Digest*.

GLEE is a musical term for a part song of a particular kind. The word, as well as the thing, is essentially confined to England. The technical meaning has been explained in different ways; but there is little doubt of its derivation from the Anglo-Saxon "gleov, gleo," *gaudium delectamentum*, and hence *ludus musicus*. Glee-man, Anglo-Saxon, "gleoman," is translated simply as "musicus" or "cantor," to which the less distinguished titles of "mimus, jocista, scurra," are frequently added in old dictionaries. The accomplishments and social position of the gleeman seem to have been as varied as those of the Provençal "joglar." To return to the word "glee," there are early examples of its being used as synonymous with harmony or concerted music. The former explanation, for instance, is given in the *Promptorium Parvulorum*, a work of the 15th century. Glee in its present meaning signifies, broadly speaking, a piece of concerted vocal music, generally unaccompanied, and for male voices, though exceptions are found to the last two restrictions. The number of voices ought not to be less than three. As regards musical form, the glee is little distinguished from the catch,—the two terms being often used indiscriminately for the same song; but there is a distinct difference between it and the madrigal—one of the earliest forms of concerted music known in England. While the madrigal does not show a distinction of contrasted movements, this feature is absolutely necessary in the glee. In the madrigal the movement of the voices is strictly contrapuntal, while the more modern form allows of freer treatment and more compact harmonies. Differences of tonality are fully explained by the development of the art, for while the madrigal reached its acme in Queen Elizabeth's time, the glee proper was little known before the Commonwealth; and its most famous representatives belong to the last century and the first quarter of the present. Among the numerous collections of the innumerable pieces of this kind, only one of the earliest and most famous may be mentioned, *Catch that Catch can, a Choice Collection of Catches, Rounds, and Canons, for three and four voices*, published by John Hilton in 1652. The name "glee," however, appears for the first time in John Playford's *Musical Companion*, published twenty-one years afterwards, and reprinted again and again, with additions by later composers—Henry Purcell, William Croft, and John Blow among the number. The father of the glee in its modern form is Dr. Arne, born in 1710. Among more recent English musicians famous for their glees, catches, and part-songs, the following may be mentioned:—Attwood, Boyce, Bishop, Crotch, Callcott, Shield, Stevens, Horsley, Webb, and Knyvett. The convivial character of the glee led, in the last century, to the formation of various societies, which offered prizes and medals for the best compositions of the kind, and assembled for social and artistic purposes. The most famous amongst these—The Glee Club—was founded in 1783, and at first used to meet at the house of Mr. R. Smith, in St. Paul's Churchyard. This club was dissolved in 1857. A similar society—The Catch Club—was formed in 1761, and is still in existence. A short historic survey of the subject is contained in Mr. W. A. Barrett's *The English Glee and Madrigal Writers*.

GLEIG, George (1753–1839), bishop of Brechin, Scotland, was the son of a farmer, and was born at Boghall, Kincardineshire, May 12, 1753. He received his early education at the school of Arbuthnott, and at the age of thirteen entered King's College, Aberdeen, where he especially distinguished himself in mathematics and the moral and physical sciences. In his twenty-first year he took orders in the Scottish Episcopal Church, and was ordained to the pastoral charge of a congregation at Pittenweem, Fife, whence he removed in 1790 to Stirling. His pastoral duties allowing him considerable leisure for literary pursuits, he became a frequent contributor to the *Monthly Review*, the *Gentleman's Magazine*, the *Anti-Jacobin Review*, and the *British Critic*. He also wrote several articles for the third edition of the *Encyclopædia Britannica*, and on the death of the editor, Colin Macfarquhar, in 1793, was engaged to edit the remaining volumes. One of his principal contributions to this work was the article Metaphysics. He was twice chosen bishop of Dunkeld, but the opposition of the primus rendered the election on both occasions ineffectual. In 1808 he was consecrated assistant and successor to the bishop of Brechin, in 1810 was preferred to the sole charge, and in 1816 was elected primus of the Episcopal Church of Scotland, in which capacity he greatly aided in the introduction of many useful reforms, in fostering a more catholic and tolerant spirit, and in cementing a firm alliance with the sister church of England. He died at Stirling in February, 1839.[1]

Besides various sermons, Gleig was the author of *Directions for the Study of Theology*, 1827; an edition of *Stackhouse's History of the Bible*, 1817; and a life of Robertson the historian, prefixed to an edition of his works. See *Life of Bishop Gleig* by the Rev. W. Walker, 1879.

GLEIM, Johann Wilhelm Ludwig (1719–1803), a minor German poet, was born April 2, 1719, near Halberstadt, and died there February 18, 1803, after having occupied, during half a century, the situation of secretary to the chapter of Halberstadt. "Father Gleim" was the title accorded to him throughout all literary Germany on account of his kind-hearted though inconsiderate and undiscriminating patronage alike of the poets and poetasters of the period. He wrote a large number of feeble imitations of Anacreon, Horace, and the minnesingers, a dull didactic poem entitled *Halladat oder das rothe Buch* (Halberstadt, 1774, 4th ed. 1812), and collections of fables and romances (*Fabeln*, Berlin, 1756–57; *Romanzen*, Berlin and Leipsic, 1756; *Lieder, Fabeln, und Romanzen*, Berlin, 1758). Of higher merit are his *Preussische Kriegslieder eines Grenadiers* (Berlin, 1758). These, which were inspired by the campaigns of Frederick II., are often distinguished by genuine feeling and vigorous force of expression. They are also noteworthy as being the first of that long series of noble political songs in which later German literature is so rich. With this exception, Gleim's writings are for the most part tamely commonplace in thought and expression. His very best odes have only a certain feeble prettiness to recommend them. A few, as *Das Hüttchin* and *An Leukon*, have still some popularity, and appear in most collections of German poetry.

See Gleim's *Sämmtliche Werke* (7 vols., Halberstadt, 1811–1813), and Körte's *Gleim's Leben aus seinen Briefen und Schriften* (Halberstadt, 1811).

GLEIWITZ, a town in the Prussian province of Silesia, chief town of the circle of Tost-Gleiwitz, government district of Oppeln, is situated on the Klodnitz, and on the railway between Oppeln and Cracow, 40 miles S. E. of the former town. It is the seat of a royal mining board, a provincial court of justice, and a tax office. It possesses one Protestant and two Catholic churches, a synagogue, a gymnasium, a school of industry, two female schools of a higher grade, a convent, a hospital, an infirmary, two orphanages, and a barracks. Gleiwitz is the centre of the iron industry of Upper Silesia. Besides the royal foundry, with which are connected machine manufactories and boiler works, there are other two foundries, meal mills, and manufactories of wire, gas-pipes, cement, and paper. The population in 1905 was 61,326.

GLENDOWER, or Glyndwr, Owen, the last native who assumed the title of Prince of Wales, and the leader of the only formidable attempt made by the Welsh to regain their freedom, after they had been subjugated by Edward I., was born most probably at Glyndwrdy in Montgomeryshire, whence his name, about the year 1354. He was the son of Gruffydd Vychan, sprung from the lords of Bromfield, and through his mother he claimed descent from a daughter of Llywelyn, the last crowned prince of Wales. He was entered a member of one of the inns of court, and brought up to the profession of the law, but he does not seem to have practised. In 1385, in the great dispute between the Grosvenors and the Scropes as to their right to bear a certain coat of arms, he was a witness for Grosvenor—one of the witnesses for Scrope being the poet Chaucer. He found his way to court, where he became a favorite with King Richard, and was made an esquire of his body. When Richard went to Ireland Owen accompanied him, as he did also on his return to Wales. He was present when Richard placed himself in the hands of the treacherous Northumber-

[1] [His son, George Robert (1796–1888), a soldier until 1815, an Oxford graduate (1820), wrote a *History of India*, and many military and other biographies. He was for forty years chaplain of Chelsea Hospital.—Am. Ed.]

land, and at Flint, where his deposition was decided upon. Owen thereupon retired into private life. He had the misfortune to have for a neighbor Reginald de Grey, earl of Ruthin; and between him and De Grey a feud existed, occasioned by a dispute about a piece of waste land. In the time of Richard, Owen was successful in a lawsuit; but no sooner was the king deposed than De Grey took forcible possession of the land. Owen in vain appealed to parliament, although the bishop of St. Asaph entreated them to grant his request, and warned them that if they did not, Wales would rise in rebellion; and a little later Henry IV., on the ground that Owen, as a crown tenant, had neglected to join an expedition to Scotland (while the fact was that the summons, which had been entrusted to De Grey to give to Owen, was not delivered until it was too late), declared a forfeiture of his land held of the crown, and granted some of it to De Grey. With armed retainers De Grey took possession; but Owen mustered his followers, and after regaining his own, devastated the lands of De Grey. Henry took De Grey's part, and Owen set both at defiance. On the 20th September, 1400, Owen struck the first blow for the freedom of his country at Ruthin, where a fair was being held. The town was burnt down. During that and the following year Owen steadily added to his strength, and the king, although he thrice invaded Wales at the head of a large army, failed to get at the enemy, who retired to the mountain fastnesses. This, and the stormy weather which the English seem to have invariably experienced, so awed them that they thought the Welsh chieftain was allied with the powers of darkness. Harsh laws were enacted against the Welsh, who thereby were only the more goaded to rebellion. The lord-marchers sided with the king, and Sir Edward Mortimer, uncle of the earl of March, gave Owen battle at Bryngias in Radnorshire, on June 22, 1402. 1100 Herefordshire men were left dead on the field, and Mortimer himself was made prisoner. It was at this battle that the Welsh women were guilty, as Shakespeare says, of inhuman conduct to the dead. This so alarmed the king that he invaded Wales in the autumn with three armies, but nothing came of it. At a parliament held at Machynlleth, at the close of this year (1402), Owen was formally proclaimed Prince of Wales. About this time it was that the first steps were taken which secured the league between Owen, Mortimer, and Percy. Early in 1403 Prince Henry —Falstaff's Hal—was appointed lieutenant of the king in Wales. He led an army into North Wales and destroyed Owen's residences, "and laid waste a fine and populous country." The next great event was the battle of Shrewsbury, at which Percy was defeated. Glendower has been accused of having neglected aid to his ally at this battle, but letters recently discovered exonerate him from blame in this respect, as he was elsewhere at the time. Meanwhile Owen was committing terrible ravages in the districts under the sway of the marchers, or where Norman castles overawed the natives; and in 1404 he sent ambassadors—his chancellor Griffith Young, and his brother-in-law John Hanmer—to Charles of France, who entered into treaty to aid Owen. In pursuance of this treaty, a large force, under the command of Hugueville, landed at Milford Haven at the end of July, 1405. But meanwhile Owen had sustained two crushing defeats from the army under Prince Henry, the first at Grosmont in Monmouthshire on the 11th March, and the second at Mynyddpwllmelin in Brecknockshire four days later. Still he was able to muster a force to join the French contingent, and with them he pushed on to the neighborhood of Worcester, where the king met them but did not fight, and the French returned home. Owen's power appears to have suffered irrevocably at the defeats of the spring. For years afterwards he carried on a desultory warfare, but defections from his ranks so weakened his power that he was no longer the dangerous enemy he had been. But he never submitted. In July, 1415—fifteen years after the first outbreak—the king, now Henry V., authorizes Sir Gilbert Talbot to treat with Owen, and to offer him and his followers free pardon, "in case they should desire it." A similar offer was made in February, 1416. His death is believed to have taken place at the house of one of his daughters in Monmouthshire, but there is no certainty as to either the date or the place of his death.

GLEYRE, Marc Charles Gabriel (1806–1874), a celebrated French painter, was of Swiss origin, having been born at Chevilly, in the canton of Vaud, May 2, 1806. His father died, and then his mother, while he was yet a boy of some eight or nine years of age; and he was brought up by an uncle at Lyons, who sent him to the industrial school of that city. Going up to Paris a lad of seventeen or nineteen, he spent four years in close artistic study—in Hersent's studio, in Sujsse's academy, in the galleries of the Louvre. To this period of laborious application succeeded four years of meditative inactivity in Italy, where he became acquainted with Horace Vernet and Léopold Robert; and six years more were consumed in adventurous wanderings in Greece, Egypt, Nubia, and Syria. At Cairo he was attacked with ophthalmia, and in the Lebanon he was struck down by fever; and he returned to Lyons in shattered health. On his recovery he proceeded to Paris, and, fixing his modest studio in the Rue de Université, began carefully to work out the conceptions which had been slowly shaping themselves in his mind. Mention is made of two decorative panels—Diana leaving the Bath, and a Young Nubian—as almost the first fruits of his genius; but these did not attract public attention till long after, and the painting by which he practically opened his artistic career was the Apocalyptic Vision of St. John, sent to the Salon of 1840. This was followed in 1843 by Evening, which at the time received a medal of the second class, and afterwards became widely popular under the title of the Lost Illusions. It represents a poet seated on the bank of a river, with drooping head and wearied frame, letting his lyre slip from a careless hand, and gazing sadly at a bright company of maidens whose song is slowing dying from his ear as their boat is borne slowly from his sight. In spite of the success which attended these first ventures, Gleyre retired from public competition, and spent the rest of his life in quiet devotion to his own artistic ideals, neither seeking the easy applause of the crowd, nor turning his art into a means of aggrandizement and wealth. After 1845, when he exhibited the Separation of the Apostles, he contributed nothing to the Salon except the Dance of the Bacchantes in 1849. And yet he labored steadily and was abundantly productive. He had an "infinite capacity of taking pains," and when asked by what method he attained to such marvellous perfection of workmanship, he would reply, "En y pensant toujours." A long series of years often intervened between the first conception of a piece and its embodiment, and years not unfrequently between the first and the final stage of the embodiment itself. A landscape was apparently finished; even his fellow artists would consider it done; Gleyre alone was conscious that he had not "found his sky." Happily for French art this high-toned laboriousness became influential on a large number of Gleyre's younger contemporaries; for when Delaroche gave up his studio of instruction he recommended his pupils to apply to Gleyre, who at once agreed to give them lessons twice a week, and characteristically refused to take any fee or reward. By instinct and principle he was a confirmed celibate: "Fortune, talent, health—he had everything; but he was married," was his lamentation over a friend. Though he lived in almost complete retirement from public life, he took a keen interest in politics, and was a voracious reader of political journals. For a time, indeed, under Louis Philippe, his studio had been the rendezvous of a sort of liberal club. To the last—amid all the disasters that befell his country—he was hopeful of the future, "la raison finira bien par avoir raison." It was while on a visit to the Retrospective Exhibition, opened on behalf of the exiles from Alsace and Lorraine, that he suddenly dropped down and expired May 5, 1874. He left unfinished the Earthly Paradise, a noble picture, which Taine has described as "a dream of innocence, of happiness, and of beauty—Adam and Eve standing in the sublime and joyous landscape of a paradise enclosed in mountains"—a worthy counterpart to the Evening. Among the other productions of his genius are the Deluge, which represents two angels speeding above the desolate earth, from which the destroying waters have just begun to retire, leaving visible behind them the ruin they have wrought; the Battle of the Lemanus, a piece of elaborate design, crowded but not cumbered with figures, and giving fine expression to the movements of the various bands of combatants and fugitives; the Prodigal Son, in which the artist has ventured to add to the parable the new element of mother's love, greeting the repentant youth with a welcome that shows that the mother's heart thinks less of the repentance than of the return; Ruth and Boaz; Ulysses and Nausicaa; Hercules at the feet of Omphale; the Young Athenian, or, as it is popularly called, Sappho·

Minerva and the Nymphs; Venus πάνδημος; Daphnis and Chloe; and Love and the Parcæ. Nor must it be omitted that he left a considerable number of drawings and water-colors, and that we are indebted to him for a number of portraits, among which is the sad face of Heine, engraved in the *Revue des Deux Mondes* for April, 1852. In Clément's catalogue of his works there are 683 entries, including sketches and studies. Gleyre is in great favor in Switzerland; and a special exhibition of his works was held at Lausanne in the Arland Museum, August and September, 1874.

See Fritz Berthoud in *Bibliothèque Universelle de Genève*, 1874; Albert de Montet, *Dict. Biographique des Genevois et des Vaudois*, 1877; and *Vie de Charles Gleyre*, 1877, written by his friend Charles Clément, and illustrated by 30 plates from his works.

GLINKA, Fedor Nikolaevich, (1788–1849), a Russian poet and author, was born at Smolensk in 1788, and was specially educated for the army. In 1803 he obtained a commission as an officer, and two years later took part in the Austrian campaign. His tastes for literary pursuits, however, soon induced him to leave the service, whereupon he withdrew to his estates in the government of Smolensk, and subsequently devoted most of his time to study or travelling about Russia. Upon the invasion of the French in 1812, he re-entered the Russian army, and remained in active service until the end of the campaign in 1814. Upon the elevation of Count Milarodovich to the military governorship of St. Petersburg, Glinka was appointed colonel under his command. On account of his suspected revolutionary tendencies he was, in 1826, banished to Petrozavodsk, but he nevertheless retained his honorary post of president of the Society of the Friends of Russian Literature, and was after a time allowed to return to St. Petersburg. Soon afterwards he retired completely from public life, and died on his estates in 1849.

Glinka's martial songs have special reference to the Russian military campaigns of his time. He is known also as the author of the descriptive poem *Kareliya*, etc. (*Carelia, or the Captivity of Martha Joanovna*), 1830, and of a metrical paraphrase of the book of Job. His fame as a military author is chiefly due to his *Pisma Russkago Ofitsera* (*Letters of a Russian Officer*), 8 vols., 1815–16.

GLINKA, Michael Ivanovich (1804–1857), a celebrated Russian composer, was born at Novospassky, a village in the Smolensk government, in 1804, and not, as stated generally in the dictionaries, in 1803. His early life he spent at home, but at the age of thirteen we find him at the Blagorodrey Pension, St. Petersburg, where he studied music under Carl Maier and John Field, the celebrated Irish composer and pianist, settled in Russia. We are told that in his seventeenth year he had already begun to compose romances and other minor vocal pieces; but of these nothing now is known. His thorough musical training did not begin till the year 1830, when he went abroad and stayed for three years in Italy, to study the works of old and modern Italian masters. His thorough knowledge of the requirements of the voice may be connected with this course of study. His training as a composer was finished under Dehn, the celebrated contrapuntist, with whom Glinka stayed for several months at Berlin. In 1833 he returned to Russia, and devoted himself to operatic composition. On November 27, 1836, took place the first representation of his *Life for the Czar*. This was the turning point in Glinka's life—for the work was not only a great success, but in a manner became the origin and basis of a Russian school of national music. Subject and music combined to bring about this issue. The story is taken from the invasion of Russia by the Poles early in the 17th century, and the hero is a peasant who sacrifices his life for the czar. Glinka has wedded this patriotic theme to inspiring and in some places admirable music. His melodies, moreover, show distinct affinity to the popular songs of the Russians, and for that reason the term "national" may be justly applied to them. His appointment as imperial chapel-master and conductor of the opera of St. Petersburg was the just reward of his dramatic successes. His second opera, *Russlan and Lyudmila*, founded on Poushkin's poem, did not appear till 1842; but in the meantime he wrote an overture and four entr'actes to Kukolnik's drama *Prince Kholmsky*. In 1844 he went abroad for a second time, and lived chiefly in Paris and Spain. On his return to St. Petersburg he wrote and arranged several pieces for the orchestra, amongst which the so-called *Kamarinskaya* has achieved popularity beyond the limits of Russia. He also composed numerous songs and romances. In 1857 he went abroad for the third time, and died suddenly at Berlin, on February 14th of that year.

GLINKA, Sergy Nikolaevich (1774–1847), Russian author, the elder brother of Fedor N. Glinka (noticed above), was born at Smolensk in 1774. In 1796 he entered the Russian army, but after three years' service retired with the rank of major. He afterwards employed himself in the education of youth and in literary pursuits, first in the Ukraine, and subsequently at Moscow, where he died in 1847. His poems are spirited and patriotic; he wrote also several dramatic pieces, and translated Young's *Night Thoughts*.

Among his numerous prose works the most important from an historical point of view are—*Russkoe Chtenie* (*Russian Reading: Historical Memorials of Russia in the 18th and 19th Centuries*), 2 vols., 1845; *Istoriya Rossii*, etc. (*History of Russia for the use of Youth*), 10 vols., 1817–19 (2d ed. 1822; 3d ed. 1824); *Istoriya Armyan*, etc. (*History of the Migration of the Armenians of Azerbijan from Turkey to Russia*), 1831; and his contributions to the *Russky Vyestnik* (*Russian Messenger*), a monthly periodical, edited by him from 1808 to 1820.

GLOBE. With the exception of illuminated portolani, the most interesting monuments of geography are globes. Celestial globes are much more ancient than terrestrial ones. The earliest of these with which we are acquainted is one made of copper engraved in the Arab-Cufic character of the 11th century. It is preserved in the Bibliothèque Nationale de Paris, Sect. Géog., No. 396 (see fig 1). In Italy the

Fig. 1.—Globe in Bibliothèque Nationale, Paris.

emperor Frederick II. (1197–1250) possessed a celestial globe of gold, probably also of Arab manufacture, on which the stars were indicated by pearls; from the scanty information that has come down to us respecting it we should imagine that it partook somewhat of the nature of an armillary sphere, as representations of the planets were to be seen in the interior of it. To these succeed a series of globes ranging from the 15th to the 17th century.

One might suppose that many specimens of these globes would exist in public libraries, but diligent research has shown that the majority of those not made of metal are more perishable than maps, and much more so than books. The earliest terrestrial globe of any importance known to

geographers is the well-known one of Martin Behaim, of Nuremberg, bearing the date of 1492. It is about 21 inches in diameter, and is made of pasteboard covered with parchment, on which are designed historical pictures with their legends written in Old German in various colors. The first meridian passes through Madeira, and the only other lines on it are those of the equator, the two tropics, and the polar circles. It has also a meridian of iron and an horizon of brass, but these were not added until 1500, which date they bear. As a monument of geography it is of the highest importance, being the only original document that has come down to us in this form embodying the geographical views of its author with those of his gifted contemporaries, Toscanelli, Columbus, etc. This globe represents with some slight modifications most of the disproportions of the Ptolemaic geography, into which is incorporated information evidently derived from the travels of Marco Polo and Sir J. Maundeville. It was executed by Behaim, assisted by Holtzchuer, while on a visit to his native city (1491–3), after a sojourn of five years at the Azores. It is still preserved in the house of his ancestors at Nuremberg. An exact and authenticated facsimile of it, mounted on a stand, is preserved in the Bib. Nat. de Paris, Section Géographique, No. 393.[1]

The Laon globe of 1493, in the possession of M. Leonce Leroux, of the Administration Centrale de la Marine à Paris, is made of red copper engraved, about the size of a 36-pounder cannon ball, and pierced by a socket which at a former period held an axis. It has all the appearance of having formed part of the apparatus of an astronomical clock. On the globe are engraved many circles. The first meridian, as in the globe of Behaim, passes through Madeira. In the northern hemisphere meridian lines are drawn at every 15th degree; these meridians are again crossed by certain parallels of latitude corresponding somewhat to the seven climates usually found on maps of the period. Neither meridians nor parallels are to be traced on the southern hemisphere. Although this globe bears a legend upon it dated 1493, it is evident that the general geographical information recorded upon it is earlier than that on Behaim's globe by five or six years. In all probability it was that current in Lisbon between the voyage of Diego Cam to the Zaire or Congo river, 1484–5, and that of Bartholomeu Diaz to the Cape of Good Hope in 1487. The author is unknown. A heart-shaped projection of this globe was published in the *Bulletin de la Soc. de Géog. de Paris*, 4me. série, tom. 20te, 1860.

In all probability the earliest post-Columbian globe extant is the one now preserved in the Lenox Library, New York. It was found in Paris some twenty-five years ago by Mr. Richard M. Hunt, who, upon learning its value, presented it to the Lenox Library,[2] of which he is the archi-

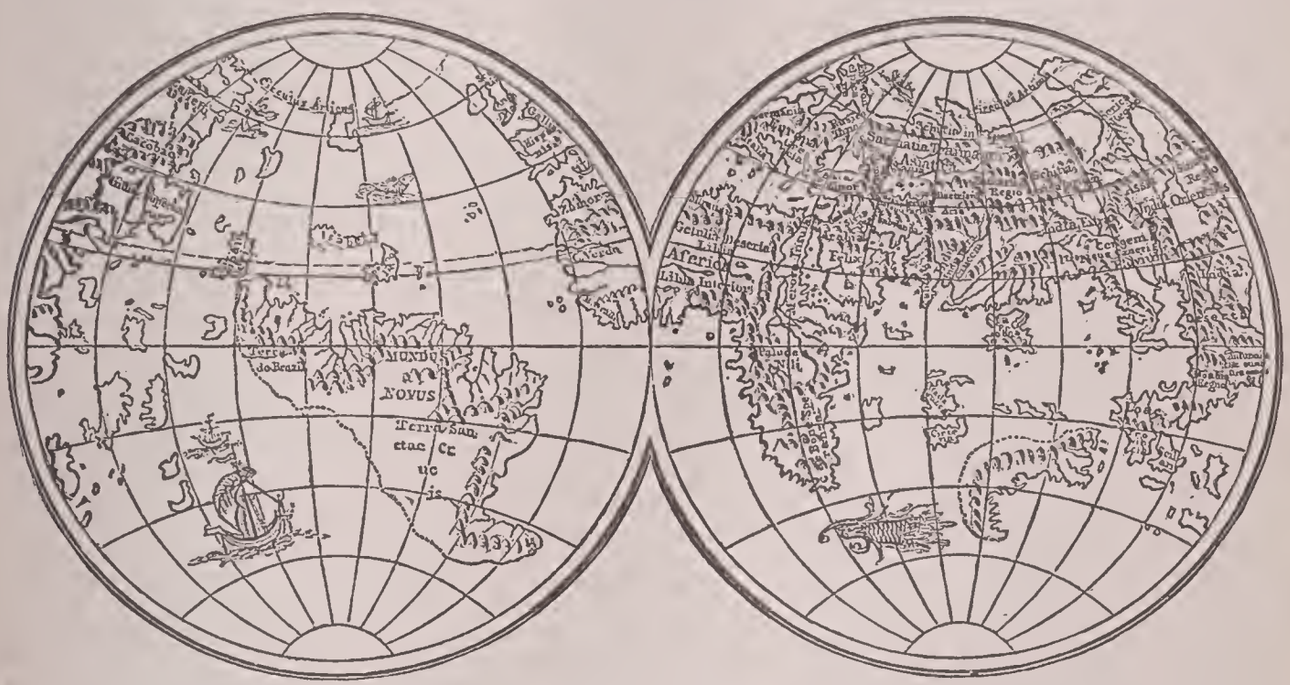

Fig. 2.—Lenox Globe.

tect. This globe is of copper, about 4½ inches in diameter, and engraved. It is pierced for an axis, and probably, like the Laon sphere, formed the principal feature of an astronomical clock or armillary sphere. The date assigned to the Lenox globe by Mr. Henry Stevens, who first recognized its importance, and had an accurately drawn projection made of it in the Coast Survey Bureau at Washington in 1869, is about 1506–7. A comparison of that projection, now published in reduced facsimile for the first time (see fig. 2), with several contemporary maps and globes, serves to show the accuracy of the date assigned to it, as also to suggest its French origin. The author is unknown.

The next globe that demands attention is the famous one made at Bamberg in 1520 by Johann Schöner, at the cost and charges of his friend Johann Sayler. It was afterwards taken to Nuremberg by Schöner, where it is still preserved in the town library. The importance attached to this globe is that hitherto it has always been regarded as the first of its kind to portray the discoveries in the New World, in combination with the notions that had previously prevailed of the space intervening between Europe and Africa on one side, and the eastern ends of Asia on the other. Schöner in this globe breaks up America into as many islands as possible. Thus North America is shown as one large island. He also represents South America as a large island, to which he applies several names, among which we observe, for the first time on a globe, the name "America." North America was not comprised under the name until a later date. Schöner's globe indicates two great series of North American discoveries, of which one, commencing with the Cabots in 1497, extended by degrees to Canada and Nova Scotia while the other, commencing with Columbus in 1492, advanced from the Bahamas slowly northwards to Virginia and New England. Between these two points there remained a region more or less known which on this globe is indicated by open water. In depicting the east coast of Asia and the many islands there, including Japan and Java-major, the author follows the globe of Behaim. By some it has been regarded as a new edition of Behaim. There are in Germany several globes which depict the world nearly in the same manner as Schöner's. One, preserved in the city of Frankfort, bearing the same date (1520), is about 10½ inches in diameter, and has been reproduced by M. Jomard in his *Monuments de la Géographie*, pl. 15 and 16. There is also another in the library of the grand-duke of Weimar. As all these globes give to North and South America the configuration they have in Schöner, Humboldt was of opinion that "they all are, with respect to America, copies of an older chart "hidden perhaps in the archives of Italy or Spain."

There is at Nancy a terrestrial globe which is also a geographical curiosity. It is of chased silver gilt, about 6

[1] For other reproductions of it see J. C. Doppelmayr, *Historische Nachricht von den Nürnbergischen Mathematicis und Künstlern*, Nuremberg, 1730; Dr. F. W. Ghillany, *Geschichte des Seefahrers Ritter Martin Behaim*, Nuremberg, 1853; and Jomard, *Monuments de la Géographie*, Paris, 1854

[2] [Founded by James Lenox (1800–80), a wealthy New York gatherer of rarities in literature and art, as a receptacle for his collection.—Am. Ed.]

inches in diameter; the land portions are represented in fine gilding, the water by azure blue enamel. One of the hemispheres opens outwards horizontally, the interior being also gilt. It formerly served the purpose of a pyx on the altar of the church of Notre-Dame-de-Sion, to which church it was offered by Charles IV., duke of Lorraine, on his return in 1663. It is now preserved in the town library. It has all the appearance of having been made at a period immediately following the execution of the curious heart-shaped map by Oronce Finé of 1531, found in the Paris edition of Grynæns, 1532. In this map and the globe at Nancy we find the New World still regarded as an extension of eastern Asia or the Indies, the geography of Marco Polo being apparently mixed up with that of Cortez in Mexico. A stereographic projection of this globe was published in *Mem. de la Soc. Roy. de Nancy*, vol. viii., 1836.

There is another globe somewhat larger than the preceding, made of copper engraved, known as the De Bure globe. It has no date, but its geographical features in the main bear a close resemblance to the globe at Nancy. It is supposed to be of Spanish origin. It is preserved in the Bib. Nat. de Paris. Section Géographique, No. 427.

In the same section, No. 394, is preserved the Ecuy globe, made of brass. The word "Rhotomagi" (Rouen) is appended to the title, whence it seems to be of French origin. We have on this globe the first indications of a separation between East Asia and North America. The date appears to be about 1540.

In 1541 the illustrious Gerard Mercator constructed and published at Louvain a terrestrial globe, and in 1551 a companion celestial globe.[1] These are without doubt the most important monuments of the kind of the 16th century. They were to be found in nearly all the universities and libraries of Europe, in the private libraries of the rich, and the class-room of the teacher of navigation. We also know from Blundeville's *Exercises* that up to the date of 1592 they were in common use in England. Six pairs at least of these globes were sold for Mercator by Camerarius of Nuremberg; others we know were sold at the book-fairs of Frankfort-on-the-Main; and Mercator himself presented one pair to the university of Louvain, of which he was a student and a master of arts. Yet only two sets of the original globes are known now to exist in Europe—one in the royal library at Brussels, discovered in 1868, the other in the imperial court library at Vienna, discovered in 1875. These globes are about 2 feet high, and when first mounted on stands with all their accessories of meridians, horizons, etc., must have presented a noble appearance. They are only known to us by facsimiles of gores reproduced from the originals in their natural size, published at Brussels in 1875, with an introduction to their history by Dr. J. Van Raemdonck. A comparison of the terrestrial globe with all those that preceded it shows it to be a monument at once of learning and of science, worthy of the greatest scientific geographer of his age.[2] The authors used by Mercator in his configurations of the continents of the Old World were chiefly Ptolemy and Marco Polo. For representing the New World he evidently acquainted himself with the narratives of all the most recent voyages, maps, and charts that were to be had in his time. These were used with the greatest possible skill and discrimination; and in consequence we have the best delineation of the world on a globe that it was possible to produce at the period. In Mercator's time the imperfect knowledge of pilots in general, and the defects of their charts in plano, made terrestrial globes much more useful to navigators than we can well realize to-day. Convinced of their importance Mercator neglected nothing in order to adapt them to the use of seamen; he therefore added to his globes the rhumbs hitherto found only on plain charts. He added yet another improvement, delineating about thirty leading stars of the principal constellations according to their magnitudes and their positions in the heavens. These important improvements appear to be quite peculiar to the globes of Mercator.

An examination of the celestial globe of 1551 also reveals many improvements introduced by Mercator in his delineation of the heavens. Without counting a great number of stars as yet unresolved into symbolical groups, Mercator gives us 934 fixed stars, distributed in 51 constellations. Two of the latter are entirely new, and are not met with on later celestial globes. These are Antinous, formed of six stars on the equator below the Eagle, and Cincinnus, or the Lock of Hair, formed of one star and two nebulæ in the north hemisphere, under the tail of the Great Bear.[3]

*The Globe of Euphrosynus Ulpius of 1542.*—This globe, apparently made in Rome, is now preserved in the museum of the New York Hist. Soc. It is 15½ inches in diameter, made of copper, and is divided into two hemispheres on the line of the equator, and fastened together with iron pins. The normal position of the globe in its stand being vertical, the north pole with its hour-circle is surmounted by an iron cross. It is encompassed by a horizon, upon which are engraved the signs of the zodiac. The height of the whole apparatus, with its stand of oak, is 3 feet 8 inches. It was executed by Euphrosynus Ulpius, a name unknown to geographers, and is dedicated to Cardinal Marcellus Cervinus, D.D., who thirteen years later, was elevated to the Roman see, under the title of Marcellus II., and survived his election only twenty-two days. The first meridian line passes through the Canaries; the remaining ones are repeated at intervals of 30 degrees. Great prominence is given to the line of demarcation between Spain and Portugal in the New World, laid down by Pope Alexander VI. The geographical features peculiar to this globe are two, evidently copied from the Verrazano map of 1529,—the legend found upon it recording the voyage made by Verrazano on behalf of Francis I. in 1524, and the rude line drawn south-east from about 57° to 36° N. lat. The latter, common to both map and globe, gave rise to the curious conception of the "Mare Verrazano," the origin of which has exercised the minds of geographers from Hakluyt down to our day.[4]

In the South Kensington Museum is a celestial globe 7½ inches in diameter, made of gilt metal (it is supposed for Rudolph II.), by G. Roll and J. Reinhold at Augsburg, dated 1584.

*Mollineux Globes of 1592.*—The true successor of Mercator in the art of globe-making was neither J. F. Van Langren, Jodocus Hondius, nor W. J. Blaeu, as has been supposed, but an Englishman named Emerie Mollineux, the friend of Hakluyt, and of John Davis of Arctic fame. The earliest notice we have of the terrestrial globe made by him is the prospective one of its intended publication, to be found at the end of the preface to the 1st edition of Hakluyt's *Voyages* of 1589. The "comming out of the very large and most exact terrestriall globe" of Mollineux there referred to, with its companion celestial one, was accomplished in 1592. At the same time appeared a manual in English for their use, by Thomas Hood of Trinity College, Cambridge; and in 1594 appeared another manual, written expressly for them in Latin by Robert Hues, entitled *Tractatus de Globis et eorum usu.* Two years afterwards this latter was translated by J. Hondius, and published in Amsterdam, giving rise to the notion, apparently still prevalent in Holland, that Hues wrote this book expressly for Hondius,—a bibliographical blunder involving injustice to the memory of Mollineux. The only examples of these once famous globes known to exist are now preserved in the library of the Middle Temple, London. They are both 2 feet in diameter, mounted on stands, with the usual accessories of horizon, meridian, etc. The celestial globe still bears the date of 1592, but the terrestrial appears to have received additions, and the date has been altered by the pen to 1603. The best description of these two globes is a contemporary one to be found in Blundeville's *Exercises*, London, 1594, which enables us to realize the difference between these globes and Mercator's:—

"The mappe which covereth Mr. Molineux his terrestriall globe differeth greatly from Mercator his terrestriall globe, by reason that there are found out divers new places, as well towards the North Pole as in the East and West Indies, which were unknowne to Mercator. They differ also greatly in names, longitudes, latitudes, and distances of such places set down not only in Mercator's globe but also in divers maps more lately made. As touching the map of the stars which covereth the celestiall globe of Mr. Molineux, I do not find it greatly to

[1] At a later period Mercator also made for Charles V. a pair of globes, the terrestrial one of wood, the celestial one of glass; these were destroyed in the subsequent troubles in the Low Countries.

[2] According to Dr. F. Wieser, a third example of it is preserved at Weimar.

[3] A pair of Mercator's globes reproduced in facsimile, natural size, were conspicuous features in the Belgian section of the exhibition connected with the geographical congress held in Paris in 1875.

[4] The history of this curious geographical puzzle will shortly be dealt with by Mr. Henry Stevens, to whom we are indebted for much information respecting this globe. A projection of a portion of it is to be seen in the *Mag. of American History*, vol. iii. p. 17, Jan., 1879.

differ from that of Mercator, saving that Mr. Molineux hath added to his celestiall globe certain southern imagos, as the Crosso, etc. In the great terrestriall globe the voyago, as well of Sir F. Drake as of Mr. Th. Candish, is set down and shewed by help of two lines, the one red, and the other blew, whereof the red line doth show what course Sir Francis observed in all his voyage, as well outward as homeward; and the blew line showeth in liko manner the voyago of Master Candish, and in that globe is also set down how farre Sir Martin Furbisher discovered towards the north parts. Nothing is set down in this globe but only tho outermost end of his voyage, named Forbisher's Straights, having in N. lat. about 63 degrees." [1]

From a later inscription on the terrestrial globe we learn that it was still further repaired in 1818 by Messrs. J. & W. Newton, globe makers, of Chancery Lane. These globes are of special interest as the first of the kind made in England and by an Englishman.

In the same year J. Van Langren, and Jodocus Hondius five years later (1597), put upon record their intention of bringing out pairs of globes; but no globes of their manufacture are known to exist of a date anterior to the 17th century. To Mollineux succeeds William Jansson Blaeu (1571–1638), a celebrated mathematician, map-drawer, and publisher of Amsterdam, who secured a considerable reputation by publishing terrestrial and celestial globes, which excelled in beauty and accuracy everything that had preceded them. He was succeeded by his son John, editor of the well-known *Atlas Major* in 11 vols. folio. The elder Blaeu constructed globes in three sizes, the largest measuring 27 inches, the next about 14½ inches, the smallest about 7½ inches in diameter. The bodies of the globes were usually made of wood, covered with plastic composition upon which the maps were pasted in gores, thus admitting of corrections being made from time to time. In consequence of this no examples of his globes are known to exist without additions of the 17th century. Mr. P. J. K. Baudet, who wrote the *Life and Works of W. J. Blaeu*, Utrecht, 1871, notwithstanding his utmost exertions, could find in Holland only two pairs, one in the astronomical observatory at Leyden, the other in the physical museum at Amsterdam, the latter being of the smallest size. Another pair, however, of the smallest size, dated 1603, are in the possession of Mr. Henry Stevens; and a pair of the medium size, belonging to Mr. Fred. Müller of Amsterdam, were exhibited at the geographical congress held in Paris in 1875. Of the last pair, the celestial globe bears the date of 1603. The terrestrial globe, though still bearing the date of the first edition of 1599, has received corrections of a much later date, embodying the geographical results of the first Dutch expedition to the East Indies under Houtman in 1598, and those of Oliver Van Noort in the same year, and of Le Maire in 1616. From a report presented to the French minister of public instruction by M. E. Cortambert in 1855, we learn that a pair of fine globes by Blaeu is preserved in the Bibliothèque de Bourges. Two pairs of the 27-inch globes of Blaeu's heirs have recently been found, the first in the library of Trinity House, Tower Hill, the second in the British Museum, of date about 1645. In their main features the globes of Blaeu coincide more or less with several well-known maps published at this period, and with others to be found in the atlases of Mercator and Hondius.

The only remaining globes of the 16th century known to us are two pairs by A. F. Van Langren; the first, preserved in the Bib. Nat. de Paris, Sect. Géog., No. 405; the second in the Bibliothèque de Grenoble, found by M. E. Cortambert in 1855. In the latter library is also to be seen a curious terrestrial globe in MS., made by some monks of the Grande Chartreuse; it is undated, but is supposed to be of the 17th century.

It remains to notice briefly the few globes of a later period that are remarkable either for their historical interest, peculiar form, or great size. In the Academy of Sciences at St. Petersburg there are or were four that call for notice. The first is a terrestrial one, 3 feet in diameter, made at Pleskow by a deacon named Karpow Maximow. It is supposed to have been the first made in Russia. This is accompanied by a planetary 2½ feet in diameter, presented to Peter the Great by the company of English merchants established in Russia. Here is also preserved a large terrestrial globe of copper, made in 1664 by the heirs of W. J. Blaeu; it is 7 feet in diameter, and was brought from Moscow about 1747. In the same academy is preserved the famous Gottorp globe; it is a hollow sphere 11 feet in diameter, containing a table and seats for twelve persons. It was made by A. Bush in 1654, under the direction of Olearius, from designs found among the papers of Tycho Brahe, and was not finished until 1664. The outside represents the terrestrial globe, the interior showing the heavens; the stars are distinguished according to their respective magnitudes by gilt nails of various sizes. It was presented to Peter the Great by Frederick IV. of Denmark in 1713. The Czar was so pleased with his acquisition that he had it transported by water to Revel, and thence on rollers and sledges to his new capital. Being partly burnt in 1747, it was repaired again 1751, and adjusted to the horizon of St. Petersburg, the meridian and horizon being made by an English mechanic named Scott.

The two largest complete globes existing are those preserved in the "Salle des Globes" in the Bibliothèque Nationale of Paris. They are each 12 feet in diameter, and were made under the direction of the famous Italian geographer Coronelli in 1683, by order of Cardinal d'Estrées, the Spanish ambassador, and presented by him to Louis XIV. They are made of wood, very solid, and are covered with cloth or canvas on which the configurations have been drawn by an able artist, particularly those on the celestial globe. The meridians and horizons are of bronze, the latter are sustained by eight columns of the same material, and the former by two bronze feet highly ornamented. Between the brackets that form the feet of the meridians is placed, under each globe, a compass in marble and bronze; the ascent to these is by five steps which encircle each globe. On the celestial globe painted blue are marked all the fixed stars, and their constellations with the paths of the comets, also the places of all the planets at the moment of the birth of Louis XIV. This last event is alluded to also in a hyperbolical inscription to be seen on a copper plate to be found on it. The geography of the terrestrial globe is based upon that of Sanson; the sea being painted in deep blue, and the land portions being white, the inscriptions upon it are very legible. There is also to be seen on it a bust of the king placed above a dedication somewhat like that on the celestial globe. Although these globes are without any great scientific value, they serve to indicate the astronomical and geographical knowledge prevalent in France at the end of the 17th century. A good illustration of these globes, accompanied by a detailed account of their history, by M. C. Letort of the Bibliothèque Nationale, will be found in *La Nature*, No. 116, August 21, 1875. In the Bib. Mazarine is preserved a terrestrial globe 8 feet in diameter, known as the Louis XVI. globe. It is made of copper engraved, the names of places being inlaid with black, and is mounted on a temporary wooden structure, the beautiful accessories of bronze cast for it never having been finished or utilized; they are, however, to be seen in another part of the library. We learn from a MS. description of this globe, also preserved here, that it was made for Louis XVI., himself no mean geographer, by the direction of Vergennes in 1784. The geography of it is based upon that of D'Anville, corrected by Robert de Vaugondy and Le Clerc; it also indicates the net results of all the voyages round the world made up to this period.

About 1764 Dr. Roger Long of Cambridge, professor of astronomy and master of Pembroke, erected in an outbuilding of his hall a sphere 18 feet in diameter. The concave interior was lined with tin, upon which was depicted all the stars and constellations visible in England on the horizon of Cambridge. The lower part of the sphere was cut off at the diameter of 13 feet, and the truncated meridians were screwed down on to a circle which ran on rollers of lignum vitæ, the whole being movable by simple machinery provided for the purpose. It was capable of holding thirty persons, and had an entrance by six steps placed over the South Pole. In the centre was placed a planetarium. Although it is said funds were left for its preservation, it appears to have fallen into neglect and decay.

To these succeed in order of size the globes known as "Georamas." One exhibited in Paris in 1844 was 30 feet in diameter; another by Delanhard erected in 1823 was 40 feet in diameter; of the last the proprietor published a description. Then follows Wyld's well known "great globe."

[1] This last remark does not appear to be quite accurate, as John Davis says:—"How far I proceeded doth appear upon the globe made by Master Emery Mullineux" (*Hydrographical Description*, London, 1595).

erected in Leicester Square, London, 60 feet in diameter. The largest appears to have been the one erected by Colonel Langlois, in Paris, in 1825, on the Champs Élysées. This was 120 feet in diameter. As has been truly said, these structures served more to satisfy curiosity than to impart scientific instruction. (C. H. C.)

*Manufacture.*—The manufacture of artificial globes has changed but little in character during the last hundred years. Such improvements as have been introduced have reference either to the quality of the maps or to the mode of mounting the globes. The number of sizes manufactured has also been increased. The diameter has always been used to indicate the size of the globes, and those now produced by the various makers vary from 1 to 36 inches.

The process of manufacture differs little if at all in the sizes of globes ranging between 3 and 25 inches. Thus supposing, for example, a 12-inch globe (the ordinary school globe) is required to be made, a spherical mould measuring some quarter of an inch less in diameter is prepared on which to form hemispherical caps that are to constitute a hollow foundation for the globe. This mould, made preferably hollow for lightness, and having a central axle terminating in poles, is well greased on the surface to enable it to resist damp. To form the caps, strips of white paper, damped in water, are first applied to the mould to form a coating thereon. Upon this coating is applied brown paper saturated with paste, and alternate layers of white and brown paper are added, until the required thickness of paper, say $\frac{1}{16}$th of an inch, is obtained. The change of color is adopted simply as a guide to the workman, that he may know when he has completed a coating of paper. The mould thus covered is put aside to dry, and after two or three days the paper covering is severed into two hemispherical caps, which are then drawn off from the mould.

A wooden axle furnished with poles (which will eventually form the north and south poles of the globe) is provided, of such a length as will enable the caps, when fitted over the poles, to meet at their severed edges. By means of glue these edges are joined up, and the caps are firmly attached to the ends of the axle. Thus a hollow sphere of rude outline is formed, measuring somewhat less than 12 inches in diameter. The next operation is to bring this sphere to the required diameter for the globe, and to make it perfectly true. For this purpose the ball is coated with a plastic composition of whiting, boiled oil, and glue, and passed under the action of a steel semicircle fitted with bearings for receiving the poles of the ball, and retaining the same in place while the ball is being slowly rotated. By applying to the ball repeated coatings of this composition, and removing all superfluities by means of the gauging edge of this steel semicircle, a smooth spherical surface is eventually obtained. When the ball is finished and hard, it is tested in loose bearings to see whether it will remain quiescent in all positions. If it shows a tendency to run round, the ball is balanced by the introduction of a counterweight at the highest part of its periphery. When the ball is balanced, and the hole made good by which the counterweight was introduced, the surface is polished, after which it is ready to receive the map. For 12-inch globes the maps of the earth and of the heavens are engraved on steel or copper plates in 12 gores, measuring each 30 degrees in width, and extending from pole to pole, or more usually to the 70th degree of latitude, the remaining portion of the maps being made up by north and south pole plates. This arrangement is somewhat modified for larger globes. Thus, for globes above 15 inches in diameter, the gores are divided in the line of the equator, and they are also divided longitudinally for say one-fourth of their length at the 15th degree, in order to facilitate the laying down of the maps evenly upon the spherical surface. Preparatory to covering the sphere with the map, it is marked with lines corresponding to the equator, parallels of latitude, and lines of longitude on the map, such lines serving as a guide for the workman. The gores of the map having been carefully cut out, they are damped and laid down in proper order in a pile upon a pasting board. The workman then covers his polished ball, for the length and breadth of a gore, with paste, or, more properly, a preparation of starch, and having coated with starch the uppermost gore of the pile, he with an ivory knife lifts that gore, and lays it upon the pasted portion of the ball, fitting it to the lines marked thereon, and smoothing down creases, at the same time taking care that the latitude and longitude lines of the gore correspond exactly with the lines on the ball. Having laid down this gore in place, he next applies a second gore in like manner, taking care that the two gores shall join each other, and not expose any portion of the underlying surface. In this way the workman proceeds until all the gores are in place, and he finishes the pasting of the ball by applying the pole papers which fit respectively on to the opposite ends of the gores. The map has next to be sized, preparatory to its being colored, in order to form a resist to the varnish which is subsequently to be applied to the globe. The map is tinted and outlined with water colors, and a coat of varnish is then applied. When this is dry the globe is ready for mounting; after which the varnishing operation is completed by the application in a heated room of several coats of spirit varnish following quickly the one on the other. Some skill is requisite in laying on the varnish, so as to obtain a surface as clear and smooth as glass. This result is unfortunately evanescent, as the best varnish is liable to discolor and to crack, and thereby obscure to some extent the legibility of the underlying map. After varnishing the globe will be fit to handle in from four to six days. For the purpose of mounting the globe a flat ring, termed the brazen meridian, is provided, and bearings are formed thereon to receive the poles of the globe. This ring is divided on its face into 360 degrees, the numbering of these degrees being from 0 (which corresponds with the equator) to 90 at the poles on one half of the ring, and on the other half the numbering starts from the poles at 0, running up to 90, which corresponds with the equator. Fitted to the poles, and capable of turning thereon, are hour circles, which underlie the brazen meridian, and are divided and numbered to correspond with the 24 hours of the day and night. The frame for the reception of the globe and ring is formed with a wooden horizon, which constitutes an imaginary line dividing the globe into two equal parts, the portion above the horizon being the visible half, and that below the horizon the invisible half of the sphere. This horizon is covered, like the globe, with papers which are varnished to protect them from injury. The horizon papers near their inner edge are divided into 360 degrees, by which are reckoned the azimuth and the amplitude; they also indicate the points of the compass in the space called the circle of the winds. The horizon of the frame is notched to receive the brass meridian, which rests in a step-bearing fitted to the central pillar or block of the frame, and is held therein by a screw stop, which, entering an annular groove in the back of the meridian, leaves the ring free to turn round in the frame, for the purpose of rectifying the globe, or bringing its axis to any desired angle with the horizon. The fitting of the globe is completed by the quadrant of altitude, consisting of a thin flexible slip of brass, jointed to a clamping nut, which is intended to embrace the brass meridian, and may be adjusted thereon by a tightening screw. This flexible strip or blade is divided off into 90 degrees, corresponding to those on the equator, and is intended to measure distances between any two places upon the curved surface of the earth, or the altitude of the sun, a star, or any planetary body in the heavens, and for this purpose its graduations are numbered from 0 to 90. A useful appendage to the globe frame is a mariner's compass, which facilitates the adjustment of the globes to their true polar position.

The value of a globe, whether terrestrial or celestial, depends mainly on the quality of the map with which it is covered. Before the present century, English globes were not only poor specimens of the engraver's art, but they showed little attention to accuracy of detail. Now, however, they rank in quality with, if they do not surpass, the best foreign maps, notwithstanding that little encouragement is given to their manufacture. Specimens of globe plates published at the latter end of the 17th century in Italy are yet to be seen, which are a marvel of the cosmographer's art. Under the patronage of the Venetian republic, V. Coronelli, cosmographer to the republic, published a terrestrial and celestial globe of the unprecedented size of 4 feet in diameter, which embodied the utmost scientific knowledge of the time, and in the constellations of the celestial globe showed the finest quality of line engraving at its best period. The composition of these figures served as a basis for the remodelling of the constellations on English globes some 40 years since, at which time the drawing of the figures was not merely barbarous, but absurd. Whether these fine globes were ever manufactured it is now difficult to ascertain, but none are known to exist except a celestial globe produced by the late Mr. William Newton, to whom the globe manufacture is indebted for such improvements as have been introduced during the present century, and another which is preserved in the Bibliothèque Nationale of Paris, bearing the name of Denvez as the maker.

An amusing illustration of the difficulties which attend the delineator of globe plates is to be found in the preface of a book published in 1686, for its author, Mr. J. Moxon, entitled *A Tutor to Astronomy and Geography*. Moxon appears to have been a globe-maker, and in expatiating on the improvements to be found in his new terrestrial globe, he says:—"California is found to be an island, though formerly supposed to be part of the main continent, whose north-west shore was imagined to thrust itself forth close to the coasts of Cathaio, and so make the supposed straits of Anian." On his globe, therefore, the peninsula was converted into an island. Precisely the same difficulties are now experienced by globe-makers; and those who have watched, for example, the varied forms which the lakes in Central Africa have taken during the last 25 years will understand at what risk the globe-maker corrects his costly plates, to bring them up to the current geographical knowledge.

The inconvenience attendant on the transport of large globes

manufactured as above explained, not to speak of their excessive cost, led to the introduction of flexible or compressible globes, both on the Continent and in the United States. It does not appear that they have been extensively manufactured, for at the best they were but toys, but they certainly displayed great ingenuity in their construction. A French manufacturer used a spherical bladder as a base for his globe, affixing to it rigid poles, and covering it with a map printed on soft white leather, which map was applied in the same way as the maps on the ordinary globe. By inflating the bladder through a mouth-piece which was fitted with a stop-cock and constituted also one of the poles, the spherical form of the globe was obtained; and by discharging the air, the globe could be compressed into a small space. A frame composed of detached pieces was also provided for this globe, to permit of its being used for working problems thereon. When not required for use, the globe and its fittings could be packed into a very small compass. The best globes of this class were to be seen in the American department of the 1851 Exhibition. These measured 24 inches in diameter, and were manufactured by the late Mr. Goodyear,[1] of india-rubber fame; but they never obtained a market in England, and were evidently intended for reference globes only.

Some 50 years ago, the late Mr. William Newton designed a pocket globe of some merit. It was mounted in a spherical case, which, opening at a centre line, disclosed the globe mounted in a brass ring, and within a fixed horizon. Upon this globe, measuring 3 inches in diameter, numerous problems could be worked with tolerable accuracy. His last and best improvement was what he termed the "Newtonian Globe." It was designed chiefly for common schools, and was set upon an iron pillar, which avoided the cost of a wooden frame. The principal object, however, of the author was to convey to children, in the most simple manner, an elementary acquaintance with the construction and movements of the heavenly bodies. The author's design may be thus briefly explained. The Newtonian globes are hung in stationary rings or meridians, and are capable of turning upon their axes or poles for the purpose of showing the real diurnal motion of the earth and the apparent diurnal motion of the heavens, according to the Newtonian system or real structure of the universe. In place of a wooden horizon, a sliding annular plate is substituted. On the terrestrial globe this plate acts as a terminator to indicate the line of demarcation between day and night. The globe is so mounted upon its pedestal that the axis always lies in its true inclined position, and points to the north polar star in the heavens. A small brass ball representing the sun is made to slide upon the meridian, and it is carried by an arched arm, which connects it with the annular terminator. This ball is adjustable to correspond to the declination or perpendicular position of the sun north or south of the equator, according as the sun's declination varies from day to day throughout the year; and the terminator follows the motions of the sun. Upon the celestial globe a similar sliding annular plate marks the visible horizon of any place on the earth's surface, and shows what part of the heavens would be there seen at a given time; it also assists in illustrating the rising and setting of the sun and moon at different seasons and periods of the year, and the apparent diurnal rotation of the planets and fixed stars. These globes have been well appreciated in the north of Europe, but as they are not in conformity with English school books, they have had little success in the United Kingdom. (A. V. N.)

GLOBE-FISH or Sea-Hedgehog. By these names some sea-fishes are known, which have the remarkable faculty of inflating their stomachs with air. They belong to the genera *Diodon* and *Tetrodon*. Their jaws resemble the sharp beak of a parrot, the bones and teeth being coalesced into one mass with a sharp edge. In the Diodonts there is no mesial division of the jaws, whilst in the Tetrodonts such a division exists, so that they appear to have two teeth above and two below. By means of these jaws they are able to break off branches of corals, and to masticate other hard substances on which they feed. Usually they are of a short,

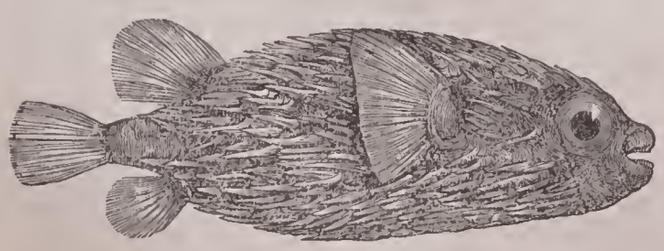

Fig. 1.—*Diodon maculatus.*

thick, cylindrical shape, with powerful fins (fig. 1). Their body is covered with thick skin, without scales, but provided with variously formed spines, the size and extent of which vary in the different species. When they inflate their capacious stomachs with air, they assume a globular form, and the spines protrude, forming a more or less formidable defensive armor (fig. 2). A fish thus blown out turns over

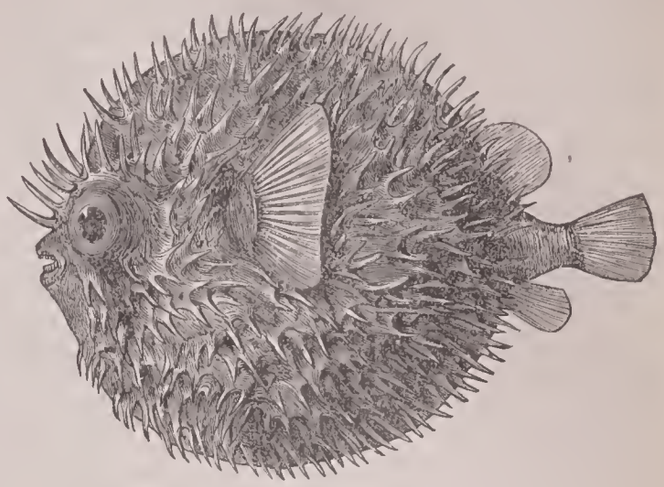

Fig. 2.—*Diodon maculatus* (inflated).

and floats belly upwards, driving before the wind and waves. Many of these fishes are highly poisonous when eaten, and fatal accidents have occurred from this cause. It appears that they acquire poisonous qualities from their food, which frequently consists of decomposing or poisonous animal matter, such as would impart, and often does impart, similar deleterious qualities to other fish. They are most numerous between the tropics and in the seas contiguous to them, but a few species live in large rivers, as, for instance, the *Tetrodon fahaka*, a fish well known to all travellers on the Nile. Nearly 100 different species are known.

GLOBIGERINA. See Foraminifera.

GLOGAU (sometimes called Gross or Great Glogau, to distinguish it from Klein or Little Glogau, in the government of Oppeln) is a fortified town of Prussia at the head of a circle in the Lower Silesian government of Liegnitz, situated partly on an island and partly on the left bank of the Oder, about 80 miles S. E. of Frankfort. Among its more important buildings are the cathedral, in the Gothic style, and a castle in the Renaissance style, now used as a courthouse; and it also possesses a new town-house, a synagogue, a poorhouse, an orphanage, a military hospital, two gymnasia, and several libraries. Situated as it is on a navigable river and at a junction of two or three railway lines, Glogau carries on an extensive trade, which is fostered by a variety of local industries, dealing with tobacco, beer, oil, sugar, vinegar, bone-meal, earthenware, etc. One of its publishing firms—that of Flemming & Company—has attained a wide reputation for maps. In 1871 the population of Glogau, inclusive of the garrison, amounted to 18,266,—of whom 6039 were Roman Catholics, and 947 Jews; and in 1905 it was stated at 23,457.

In the beginning of the 11th century Glogau, even then a populous and fortified town, was able to withstand a regular siege by the emperor Henry V.; but in 1157 the duke of Silesia, finding he could not hold out against Frederick Barbarossa, set the place on fire. In 1252 the town, which had been raised from its ashes by Henry the Bearded, became the capital of a principality of Glogau, which continued till 1506, when town and district were united to the Bohemian crown. In the course of the Thirty Years' War Glogau suffered greatly. The inhabitants, who had become Protestants soon after the Reformation, were dragooned into conformity by Wallenstein's soldiery; and the Jesuits received permission to build themselves a church and a college. Captured by the Protestant allies in 1632, and recovered by the Imperialists in 1633, the town was again captured by the Swedish general Torstenson in 1642, and continued in Protestant hands till the peace of Westphalia in 1648. In 1741 the Prussians took the place by storm, and during the Seven Years' War it formed an important centre of operations for the Prussian forces. After the battle of Jena it fell into the hands of the French; and they have reason to be proud of the gallant defence made by Laplane, who held out against the Russian and Prussian besiegers, after the battle of Katzbach (August 26, 1813), till the 17th of the following April

GLOSS, GLOSSOGRAPHER, GLOSSARY, GLOSSATOR. The Greek word γλῶσσα, meaning originally a

[1] [Charles Goodyear (1800-60), of Connecticut, invented the art of vulcanizing rubber, was denied French and English patents, and died poor.—Am. Ed.]

tongue, hence a language or dialect, gradually came to denote especially any obsolete, foreign, provincial, technical, or otherwise peculiar word or use of a word (see Arist. *Rhet.* iii. 3, 2); and the making of collections and explanations of such *γλῶσσαι* was at a comparatively early date a well-recognized form of literary activity. Even in the 5th century, among the many writings of Democritus of Abdera was included a treatise entitled Περὶ Ὁμήρου ἢ ὀρθοεπείης καὶ γλωσσέων. It was not, however, until the Alexandrian period that the *γλωσσογράφοι* became very numerous. Of many of these it is probable that even the names have perished; but in the writings of Athenæus alone (*c.* 250 A. D.) allusions are to be found to no fewer than thirty-five. Among the earliest may be mentioned Philetas of Cos (d. *c.* 290 B. C.), the elegiac poet, to whom Aristarchus dedicated the treatise πρὸς Φιλητᾶν; he was the compiler of a lexicographical work, arranged probably according to subjects, and entitled Ἄτακτα or Γλῶσσαι (sometimes ἀτακτοι γλῶσσαι). Next came his disciple Zenodotus of Ephesus (*c.* 280 B. C.), one of the earliest of the Homeric critics and the compiler of Γλῶσσαι Ὁμηρικαί; Zenodotus in turn was succeeded by his greater pupil Aristophanes of Byzantium (*c.* 200 B. C.), whose great compilation περὶ λέξεων (still partially preserved in that of Pollux), is known to have included Ἀττικαὶ λέξεις Λακωνικαὶ γλῶσσαι, and the like. From the school of Aristophanes issued more than one glossographer of name—Diodorus, Artemidorus (γλῶσσαι, and a collection of λέξεις ὀψαρτυτικαί), Nicander of Colophon (γλῶσσαι, of which some twenty-six fragments still survive), and Aristarchus, the famous critic, whose numerous labors included an arrangement of the Homeric vocabulary (λέξεις) in the order of the books. Contemporary with the last named was Crates of Mallos, who, besides making some new contributions to Greek lexicography and dialectology, was the first to create at Rome a taste for similar investigations in connection with the Latin idioms. From his school proceeded Zenodotus of Mallos, the compiler of Ἐθνικαὶ λέξεις or γλῶσσαι, a work said to have been designed chiefly to support the views of the school of Pergamus as to the allegorical interpretation of Homer.[1] Of later date were Didymus (Chalkenteros, *c.* 50 B. C.), who made collections of λέξεις τραγωδουμέναι κωμικαί, etc.; Apollonius Sophista (*c.* 20 B. C.), whose Homeric *Lexicon* has come down to modern times; and Neoptolemus, known distinctively as ὁ γλωσσογράφος. Coming down to the beginning of the first century of the Christian era we find Apion, a grammarian and rhetorician at Rome during the reigns of Tiberius and Claudius, following up the labors of Aristarchus and other predecessors with γλῶσσαι Ὁμηρικαί, and a treatise περὶ τῆς Ῥωμαϊκῆς διαλέκτου; Heliodorus or Herodorus was another almost contemporary glossographer; Erotian also, during the reign of Nero, prepared a special glossary for the writings of Hippocrates, still preserved. To this period also Pamphilus, the author of the λειμών from which Diogenian and Julius Vestinus afterwards drew so largely, most probably belonged. In the following century one of the most prominent workers in this department of literature was Ælius Herodianus, whose treatise περὶ μονήρους λέξεως has been edited in modern times, and whose ἐπιμερισμοί we still possess in an abridgment; other names are those of Pollux, of Diogenian (λέξις παντοδαπή), of Julius Vestinus (ἐπιτομὴ τῶν Παμφίλου γλωσσῶν), and especially that of Phrynichus, who flourished towards the close of the 2d century. His *Eclogæ nominum et verborum Atticorum* has frequently been edited. To the 4th century belongs Ammonius of Alexandria (*c.* 389), who wrote περὶ ὁμοίων καὶ διαφόρων λέξεων, a dictionary of words used in senses different from those in which they had been employed by older and approved writers. Of somewhat later date is the well-known Hesychius, whose often-edited Λεξικόν rightly superseded all previous works of the kind; Cyril, the celebrated patriarch of Alexandria, also contributed somewhat to the advancement of glossography by his συναγωγὴ τῶν πρὸς διάφορον σημασίαν διαφόρως τονουμένων λέξεων; the names of Orus and Orion, of Philoxenus, and of the two Philemons also belong to this period. The works of Photius, Suidas, and Zonaras, as also the *Etymologicum Magnum*, to which might be added the *Lexica Sangermansia* and the *Lexica Segueriana*, have already been referred to (Dictionary, vol. vii. p. 158). In Latin lexicology the most prominent name is that of Festus, whose only extant work, however, is but an epitome of the treatise of Verrius Flaccus *De Verborum Significatu*. This last-named author had himself been preceded by Varro (*De Lingua Latina*) who in turn makes allusion to several before him, "qui glossas scripserunt." The introduction of grammatical and linguistic studies into Rome is usually attributed to Crates of Mallos (*c.* 267 B. C.) mentioned above.

To a special category of technical glossaries belongs a large and important class of works relating to the law-compilations of Justinian. Although the emperor forbade, under severe penalties, all commentaries (ὑπομνήματα) on his legislation (*Const. Deo Auctore*, sec. 12; *Const. Tanta*, sec. 21), yet indices (Ἰνδικες) and references (παράτιτλα), as well as translations (ἑρμηνείαι κατὰ πόδα) and paraphrases (ἑρμηνείαι εἰς πλάτος), were expressly permitted, and lavishly produced. Among the numerous compilers of alphabetically arranged λέξεις Ῥωμαϊκαί or Λατεινικαί, and γλῶσσαι νομικαί (Glossæ nomicæ), Cyril and Philoxenus are particularly noted; but the authors of παραγραφαί, or σημειώσεις, whether ἔξωθεν or ἔσωθεν κειμεναι, are too numerous to mention. A collection of these παραγραφαί τῶν παλαιῶν, combined with νέαι παραγραφαί on the revised code called τὰ βασιλικά, was made about the middle of the 12th century by a disciple of Michael Hagiotheodorita. This work is known as the *Glossa Ordinaria τῶν βασιλικῶν*.[2]

In Italy also, during the period of the Byzantine ascendency, various glossæ (glosæ) and scholia on the Justinian code were produced;[3] particularly the Turin gloss (reprinted by Savigny), to which, apart from later additions, a date prior to 1000 is usually assigned. After the total extinction of the Byzantine authority in the West the study of law became one of the free arts, and numerous schools for its cultivation were instituted. Among the earliest of these was that of Bologna, where Pepo (1075) and Irnerius (1100–1118) began to give their expositions. They had a numerous following, who, besides delivering exegetical lectures ("ordinariæ" on the *Digest* and *Code*, "extraordinariæ" on the rest of the *Corpus Juris Civilis*), also wrote Glossæ, first interlinear, afterwards marginal.[4] The series of these glossators was closed by Accursius (see Accorso) with the compilation known as the *Glossa ordinaria* or *magistralis*, the authority of which soon became very great, so that ultimately it came to be a recognized maxim, "Quod non agnoscit glossa, non agnoscit curia."[5] For some account of the glossators on the canon law, see vol. v. p. 19 (Canon Law).

*Bible Glosses.*—With the decay of learning and originality during the dark ages grew the necessity for making and the custom of transcribing on manuscript copies of the Vulgate various notes, explanatory or otherwise, of the text. Ultimately collections of these glosses or sets of glosses came to be made. They are distinguished as either marginal or interlinear. The most famous collection of *Glossæ marginales* was that made by Walafridus Strabus in the 9th century; it consists of notes grammatical, historical, and theological, culled from the writings of Augustine, Ambrose, Jerome, Gregory, Isidore, Bede, Alcuin, and Hrabanus Maurus, with additions by himself. The interlinear glosses (which as a rule were not so full as the marginal) were sometimes theological but more generally purely philological. A somewhat important collection of interlineal glosses belonging to the former class was made by Anselm of Laon (*c.* 1100). The philological glosses have considerable value to the linguistic student, especially those which originated in Germany during the Carolingian period. The MS. vocabularies in the libraries of St. Gall, Munich, Vienna, etc., have been frequently examined of late years with results which have been fully indicated by Raumer in his treatise on the influence of Christianity upon Old High German (*Einwirkung des Christenthums auf die althochdeutsche Sprache*).[6] Some interlinear vernacular translations of por-

[1] See Matthæi, *Glossaria Græca*, Moscow, 1774–5.

[2] See Labbé, *Veteres glossæ verborum juris quæ passim in Basilicis reperiuntur* (1606); Otto, *Thesaurus juris Romani*, vol. iii. (1697); Stephens, *Thesaurus linguæ Græcæ*, vol. viii. (1825).

[3] See Biener, *Geschichte der Novellen*, p. 229 *sqq.*

[4] Irnerius himself is with some probability believed to have been the author of the Brachylogus (*q. v.*).

[5] Thus Villani (*De origine civitatis Florentinæ*) says of the Glossæ that "tantæ auctoritatis gratiæque fuere, ut consensu omnium publice approbarentur et spretis abolitisque penitus aliis solæ juxtus textus legum oppositæ sunt et ubique terrarum sine controversia pro legibus observantur, ita ut propemodum nefas sit, non secus quam textui, Glossis Accursii contraire, sicut antiqua fama referente comperi." For similar testimonies see Bayle's *Dictionnaire s. v.* "Accursius," and Rudorff, *Röm. Rechtsgeschichte*, i. p. 338 (1857).

[6] Considerable interest of a similar kind attaches to the so-called *Glossæ malbergicæ* upon the Latin text of the Salic law. It was at one time held that in these glosses we have some relics of the ancient

tions of the Bible into the Anglo-Saxon, of the 9th and following centuries, have also been recently reprinted (see ENGLISH BIBLE).

GLOSSOP, a municipal borough of Derbyshire, is situated on the extreme northern border of the county, 14 miles E. S. E. of Manchester. It is the chief seat of the cotton manufacture in Derbyshire, and it has also woollen and paper mills, dye and print works, and bleaching greens. The town has for several years been rapidly increasing in size, and now consists of three main divisions, viz., the Old Town (or Glossop proper), Howard Town (or Glossop Dale), and Mill Town. The principal buildings are the town hall and market-house, the temperance hall, the grammar school, and the mechanics' institution. In the immediate neighborhood is Glossop Hall, the seat of Baron Howard, lord of the manor, a picturesque old building with extensive terraced gardens. On a hill near the town is Milandra Castle, the site of a Roman station.

Glossop was granted by Henry I. to William Peverel, on the attainder of whose son it reverted to the crown. In 1157 it was gifted by Henry II. to the abbey of Basingwerk. Henry VIII. bestowed it on the earl of Shrewsbury, and it now belongs to the Howards. It was made a municipal borough in 1866. The population in 1901 was 21,526.

Plate VII.

GLOUCESTER, a county in the west midland district of England, bounded on the N. by Worcester and Warwick, on the S. by Somerset, on the E. by Oxford and Wilts, and on the W. by Hereford and Monmouth. The river Wye forms the western boundary line, the Stratford Avon part of the northern, the Bristol Avon the south-western, and the Thames for some miles the south-eastern. The shape of the county is irregularly elliptical, its greatest length in direct line from Bristol to Clifford Chambers (N. E.) being 54 miles, its greatest width from Down Ampney to Preston, near Ledbury, at right angles, 33 miles. The area, according to the tithe surveys—deducting 3000 acres of detached land incorporated by an Act of 1844 with the counties of Worcester, Warwick, and Wilts, by which they were surrounded, and 17,688 acres of water—amounts to 805,102 acres, mostly cultivable. The county contains 29 hundreds, among which are grouped 351 parishes, 227 tithings, liberties, and hamlets; and the parishes are arranged in 17 poor law unions for the relief of the poor, and 21 petty sessional divisions for the administration of justice and sanitary purposes. Electorally Gloucestershire is divided into the two divisions of East and West Gloucestershire, each returning two members. The latter comprises Dean Forest to the Severn bank (the "Eye between Severn and Wye" of the local proverb), and the country S. of the former river to S. E. and N. E. of Dursley, the chief polling place of the division. East Gloucestershire, comprehending the rest of the county, has its chief polling places at Gloucester and Cheltenham, and besides these boroughs, the former of which returns two members and the latter one, has within its limits the boroughs of Stroud with two members, and Tewkesbury and Cirencester with one each. West Gloucestershire, sharing with North Somerset the city of Bristol, sends two more members to parliament, so that the total representation of the county is 13 members. Gloucestershire contains 28 market-towns and 2 cities.

The population of the county in 1851 was 458,805 (218,187 males and 240,618 females); in 1861 it was 485,770 (229,009 males and 256,761 females); and in 1871 it had increased to 534,320 (251,943 males and 282,377 females). Since the first census in 1801 the population has increased by 283,917 persons, or 113 per cent. Pop. 1901, 634,666.

The population of the principal towns at the census of 1901 was as follows:

| | | | |
|---|---|---|---|
| Bristol city | 328,945 | Tetbury | 5,300 |
| Cheltenham | 49,493 | Newent | 5,200 |
| Gloucester | 47,943 | Dursley | 5,172 |
| Stroud | 9,188 | Wotton-under-edge | 3,700 |
| Cirencester | 7,536 | Nownham | 1,800 |
| Tewkesbury | 5,419 | | |

The county has three natural divisions, the hill, the vale, and the forest, parallel to each other north and south. (1.) The hill country, which, except the high ground of the Forest of Dean, consists wholly of the Cotteswolds, a range extending from Broadway near Chipping-Campden on the north to Bath on the south, and from Birdlip hills on the west to Burford on the east, and traversing the eastern side of the county at an average elevation of 700 feet, though in parts, as at Cleeve Hill near Prestbury, it is 1134 feet above the level of the sea. It covers nearly 300,000 acres of undulating table-land, locally subdivided into the Southwolds betwixt Bath and Badminton, the Stroudwater hills betwixt Tetbury and Woodchester, and the Cotteswolds proper, or the rest of the hill country northward. (2.) The Vale, or that level tract extending from the base of the Cotteswolds to the east bank of the Severn, the upper or northern part of which expanse is known as the vale of Gloucester, and embraces Gloucester, Cheltenham, Tewkesbury, and some 50,000 acres; whilst the lower is the vale of Berkeley, a tract of similar area reaching from Aust Cliff on the Severn opposite the mouth of the Wye to Robin's Wood hill, two miles south-east of Gloucester. The vale of Gloucester is a continuation of the vale of Evesham. (3.) The Forest division is the peninsula lying between the Wye and the Severn, in modern times limited to the Forest of Dean, but anciently occupying all Gloucestershire west of Severn, and covering some 43,000 acres. The area of the present forest is 23,015 acres, 11,000 of which are enclosed. Its length from north to south is 20 miles, its breadth (east to west) 10 miles.

*Geology.*—Though the igneous rocks are little developed, the great variety of sedimentary deposits makes Gloucestershire a rich field for the geologist. At Damory, Charfield, and Woodford is a patch of greenstone, the cause of the upheaval of the Upper Silurian basin of Tortworth, in which are the oldest stratified rocks of the county. Of these the Upper Llandovery is the dominant stratum, exposed near Damory mill, Micklewood chase, and Purton passage, wrapping round the base of May and Huntley hills, and re-appearing in the vale of Woolhope. The Wenlock limestone is exposed at Falfield mill and Whitfield, and quarried for burning at May hill. The Lower Ludlow shales or mudstones are seen at Berkeley and Purton, where the upper part is probably Aymestry limestone. The series of sandy shales and sandstones which, as Downton sandstones and Ledbury shales, form a transition to the Old Red Sandstone, are quarried at Dymock. The "Old Red" itself occurs at Berkeley, Tortworth Green, Thornbury, and several places in the Bristol coal-field, in anticlinal folds forming hills. It forms also the great basin extending from Ross to Monmouth and from Dymock to Mitcheldean, Abenhall, Blakeney, etc., within which is the Carboniferous basin of the Forest. It is cut through by the Wye from Monmouth to Woolaston. This formation is over 8000 feet thick in the Forest of Dean. The Bristol and Forest Carboniferous basins lie within the synclinal folds of the Old Red Sandstone; and though the seams of coal have not yet been correlated, they must have been once continuous, as further appears from the existence of an intermediate basin, recently pierced, under the Severn. The lower limestone shales are 500 feet thick in the Bristol area, and only 165 in the Forest, richly fossiliferous, and famous for their bone bed. The great marine series known as the Mountain Limestone, forming the walls of the grand gorges of the Wye and Avon, are over 2000 feet thick in the latter district, only 480 in the former, where it yields the brown hematite so largely worked for iron even from Roman times It is much used too for lime and road metal. Above this comes the Millstone Grit, well seen at Brandon hill, where it is 1000 feet in thickness, though but 455 in the forest. On this rest the Coal-measures, consisting in the Bristol field of two great series, the lower 2000 feet thick with 36 seams, the upper 3000 feet with 22 seams, 9 of which reach 2 feet in thickness. These two series are divided by over 1700 feet of hard sandstone (Pennant Grit), containing only 5 coal-seams. In the Forest coal-field the whole series is not 3000 feet thick, with but 15 seams. At Durdham Down a Dolomitic conglomerate, of the age known as Keuper or Upper Trias, rests unconformably on the edges of the Palæozoic rocks, and is evidently a shore deposit, yielding dinosaurian remains. Above the Keuper clays come the Penarth beds, of which classical sections occur at Westbury, Aust, etc. The series consists of grey marls, black paper shales containing much pyrites and a celebrated bone bed, the Cotham landscape marble, and the white Lias limestone, yielding *Ostrea Liassica* and *Cardium Rhæticum*. The district of Over Severn is mainly of Keuper marls. The whole Vale of Gloucester is occupied by the next formation the Lias, a warm sea deposit of clays and clayey limestones

Celtic tongue; but their truly Germanic character was afterwards conclusively established by Jacob Grimm.

characterized by ammonites, belemnites, and gigantic saurians. At its base is the insect limestone bed. The pastures producing Gloucester cheese are on the clays of the Lower Lias. The more calcareous Middle Lias or marlstone forms hillocks flanking the Oolite escarpment of the Coteswolds, as at Wotton-under-Edge, and Churchdown. The Coteswolds consist of the great limestone series of the Lower Oolite. At the base is a transition series of sands, 30 to 40 feet thick, well developed at Nailsworth and Frocester. Leckhampton hill is a typical section of the Lower Oolite, where the sands are capped by 40 feet of a remarkable pea grit. Above this are 147 feet of freestone, 7 feet of oolite marl, 34 feet of upper freestone, and 38 feet of ragstone. The Painswick stone belongs to lower freestone. Resting on the Inferior Oolite, and dipping with it to S. E., is the "fuller's earth," a rubbly limestone about 100 feet thick, throwing out many of the springs which form the head waters of the Thames. Next comes the Great or Bath Oolite, at the base of which are the Stonesfield "slate" beds, quarried for roofing, paling, etc., at Sevenhampton and elsewhere. From the Great Oolite Minchinhampton stone is obtained, and at its top is about 40 feet of flaggy Oolite with bands of clay known as the Forest Marble. Ripple marks are abundant on the flags; in fact all the Oolites seem to have been near shore or in shallow water, much of the limestone being merely comminuted coral. The highest bed of the Lower Oolite is the Cornbrash, about 40 feet of rubble, productive in corn, forming a narrow belt from Siddington to Fairford. Near the latter town and Lechlade is a small tract of blue Oxford Clay of the Middle Oolite. The county has no higher Secondary or Tertiary rocks; but the Quaternary series is represented by much northern drift gravel in the Vale and Over Severn, by accumulations of Oolitic detritus, including post-Glacial extinct mammalian remains on the flanks of the Coteswolds, and by submerged forests extending from Sharpness to Gloucester.[1]

*Agriculture.*—In the soil of the hill country is so much lime that a liberal supply of manure is required. This is provided by folding sheep, and by paring and burning the turf and strewing the ashes on the surface. Good crops of barley and oats are thus obtained, and even of wheat, if the soil is mixed with clay. But the poorest land of the hill country affords excellent pasturage for sheep, the staple commodity of the district; and the sainfoin, which grows wild, yields abundantly under cultivation. The Coteswolds have been famous for the breed of sheep named from them since the early part of the 15th century,—a breed hardy and prolific, with lambs that quickly put on fleece, and become attempered to the bracing cold of the hills, where vegetation is a month later than in the vale. Improved of late years by judicious crossing with the Leicester sheep, the modern Coteswold has attained high perfection of weight, shape, fleece, and quality. The ewes are good mothers; the wool produce, of which the staple is long and mellow to the hand though rather coarse in quality, is an important item, averaging from 7 to 8 lb a head in a Coteswold flock. An impulse has been given to Coteswold farming since the chartering in 1845 of the Royal Agricultural College at Cirencester, to instruct young men in farming and the kindred sciences. The pupils engage in the cultivation of a farm of 700 acres attached to the college, a Gothic structure near Cirencester, which has hitherto accommodated on an average 100 inmates. Yet, despite the march of improvement, the aspect of the district is somewhat barren, owing to the absence of trees and hedgerows in the so-called "stone wall" country, and to the size of the farms, sometimes exceeding 1000 acres. Cattle are kept for home needs and to improve the soil. Oats and barley are the chief grain crops. In the Vale the deep rich black and red loamy soil is well adapted for cattle, and a moist mild climate favors the growth of grasses and root crops. A great proportion of the Vale is in permanent pasture, and its farmers look largely to hay as the winter food of their stock. The cattle, save on the frontier of Herefordshire, are mostly shorthorns, of which many are fed for distant markets, many reared and kept for dairy purposes. The rich grazing tract of the Vale of Berkeley is said to produce annually 1200 tons of the famous double Gloucester cheeses, and the Vale in general has long been celebrated for its cheese and butter. The Vale of Gloucester is the chief corn district. Its aspect is generally pastoral, characterized by grass-lands hemmed in with hedgerows and hedgerow timber, and dotted with apples, pears, and orchard fruit as if to compensate for the comparative barrenness of the Coteswolds. The Vale, from its position and climate, is subject to violent storms of wind and rain.

*Statistics of Agriculture for Gloucestershire as returned on 4th of June, 1878.*

| | | |
|---|---|---|
| Total area | 804,977 | acres. |
| Total acreage under crops, bare fallow, and grass | 648,795 | " |
| Corn crops (nearly one-half wheat and one-fourth barley) | 172,515 | " |
| Green crops (about two-thirds turnips and swedes) | 62,679 | " |
| Grasses under rotation | 94,279 | " |
| Permanent pasturage | 307,026 | " |
| Bare and fallow | 12,263 | " |
| Flax and hops | 33 | " |

*Live Stock.*

| | |
|---|---|
| Horses | 25,725 |
| Cattle | 107,236 |
| Sheep | 416,853 |
| Pigs | 69,331 |

According to the Owners and Heritages Return 1872–73, the county was divided among 37,705 proprietors, holding land whose acreage was 733,640, and whose gross estimated rental was £2,556,543. The estimated extent of commons and waste lands was 7429 acres. Of the owners 76 per cent. possessed less than one acre, and the average value all over was £3 8s. 11¾d. There were 10 proprietors who possessed upwards of 5000 acres, viz.—Lord Fitzhardinge, 18,264; Duke of Beaufort, 16,610, Lord Sherborne, 15,773, Earl Bathurst, 9967, Crown Property, 9575, R. S. Holford (Weston Birt), 9332; Thomas W. C. Master (Cirencester), 7226; Earl Eldon (Encomb), 6664; Lord Sudeley (Winchcomb), 6620, Earl Ducie, 5193.

*Forest District.*—The surface of this district is agreeably undulating to the height of from 120 to 1000 feet, and its sandy peat soil renders it most suitable for the growth of timber, which is the cause of its having been a royal forest from time immemorial. John Evelyn records that the commanders of the Armada had orders not to leave in it a tree standing. In the reign of Charles I. the Forest contained 105,537 trees, and, straitened for money, he granted it to Sir John Wyntour for £10,000, and a fee farm rent of £2000. The grant was cancelled by Cromwell; but at the Restoration only 30,000 were left, and Wyntour, having got another grant, destroyed all but 200 trees fit for navy timber. In 1680 an Act was passed to enclose 11,000 acres and plant with oak and beech for supply of the dockyards; and the present forest, though not containing very many gigantic oaks, has six "walks" covered with timber in various stages of growth. The two finest oaks of the Forest are a headless giant 45 feet in girth just outside the village of Newland, to the left of the road from Coleford to Monmouth, and "Jack of the Yat," with 19 feet of girth, on the right of the roadside from Coleford to Mitcheldean.[2]

*Botany.*—The flora of the county, representing that of the two main hydrographical areas of the kingdom and of various geological formations, is extremely rich. Its distinct forms of phanerogams number more than half the British flora. But there is little bog land in the county, and no true sea coast. Hence certain gaps in the list of indigenous plants. There are only some 25 species of ferns; but the rare flowers mentioned below are worthy of note as indigenous.[3] The quantity of mistletoe on the numerous apple trees in the cider orchards of the Vale is another

[1] *Authorities.*—*Geology of East Somerset and Gloucester Coal-fields*, H. B. Woodward, F.G.S.; *Memoirs of Geol. Survey*, London, 1876; "Geology of Country round Cheltenham," E. Hull, A.B., F.G.S., in *Memoirs of Geol. Survey*, 1857; "Geology of Part of Wilts and Gloucester," *ib.*, 1852; *The Coteswold Hills*, John Lycett, London, 1857; papers by Mr. Lycett in *Quart. Journ. of Geol. Soc.*, vol. iv., and by Dr. Wright in vols. xii. and xvi.

[2] The Forest is locally governed by two crown-appointed deputy gavellers to superintend the woods and mines, and four verderers elected by the freeholders, whose office, since the extermination of the deer in 1850, is almost purely honorary. From time immemorial all persons born in the hundred of St. Briavel's, who have worked a year and a day in a coal mine, become "free miners," and may work coal in any part of the Forest not previously occupied. At the present time the Forest laws are administered at the Speech-House by the queen's officers and the free miners.

[3] *Anemone Pulsatilla; Arabis stricta; Thlaspi perfoliatum; Hutchinsia petræa; Polygala oxyptera* and *calcarea; Cerastium pumilum; Lotus angustissimus; Pyrus pinnatifida; Epilobium lanceolatum; Sedum rupestre; Trinia vulgaris; Limnanthemum nymphæoides; Veronica hybrida; Orobanche Hederæ; Cynoglossum montanum; Utricularia neglecta; Daphne Mezereum; Buxus sempervirens; Cephalanthera rubra; Galanthus nivalis.*

botanical feature of the county, a parasite occurring on other trees also, notably on the Badham Court oak, Sedbury Park, Chepstow, and on the Frampton-on-Severn oak. The elm, used at Bristol for shipbuilding, the willow, and the maple form the chief hedge timber of the Vale, while in the Forest some fine hollies, 6 feet round, are found amongst the oaks. The Spanish chestnut at Tortworth, Piff's elm, Boddington, near Cheltenham, and the Lassington oak are the most notable trees of the county. Mustard was once much cultivated in the Vale, "few houses being without a cannon ball and bowl in which the seeds were bruised" (see Rudge's *General Views of Agriculture of Gloucester*, London, 1807).[1]

*Communication and Trade.*—Gloucestershire is, in virtue of its two city ports, Bristol and Gloucester, a maritime county. The approach to the first is by the Somerset Avon, to the second by the Severn, or, more strictly, by the Gloucester and Berkeley canal, for which, owing to the dangerous navigation of the Severn, an Act was obtained in 1793, though the works were not completed and opened for traffic till 1827. They consisted of a small tidal basin and lock at Sharpness Point, on the Severn, near Berkeley, connecting the estuary of the river by a ship canal 16 miles long with the city of Gloucester, where there was a suitable discharging dock, and where the canal was again connected with the river Severn by a lock. The gradual extension of the trade necessitated a corresponding extension of the works, and in 1869 a new and enlarged entrance, half a mile further down the river, was projected, with suitable discharging and repairing docks, which last form one large sheet of water on the same level as the old canal connecting them also with Gloucester. These were completed and opened in 1874. Through the river Severn from Gloucester to Worcester and Stourport the port is brought into direct communication with the great system of internal canals throughout the kingdom, and both at Sharpness docks and Gloucester is in direct communication with the Midland and Great Western railway systems. The following are the trade statistics of the year ending September 25, 1878:

| | Tons. | Tons. |
|---|---|---|
| Foreign imports | 428,532 | |
| Coasting | 105,224 | 533,756 |
| Foreign exports | 51,047 | |
| Coasting | 112,176 | 163,223 |
| Total traffic | | 696,979 |

Of the foreign imports 253,643 tons, amounting to about 1,200,000 quarters, were grain and seed. The port is well situated for a corn port, its corn warehouses at Sharpness accommodating 100,000 quarters, and those of Gloucester about 130,000 quarters. The new works at Sharpness will accommodate vessels up to 2500 tons burden.

The Severn Bridge railway—5 miles in length—commences at Lydney by a junction with the Great Western Railway and the Severn and Wye railway, crosses the Severn at Purton Passage, and terminates at the Berkeley new docks by a junction with the Midland, thus forming a long-needed connection between the two sides of the river, and shortening the distances from South Wales to London by 14 miles, and from South Wales to Bristol by 20. Its great local importance consists in providing a communication from South Wales and Dean Forest and their coal-fields to the Berkeley new docks and the south of England, as is evidenced by the various competing schemes introduced in the same session of 1872 for bridges having the same object. The great iron bridge itself consists of girders constructed on a modification of the bow-string principle, and rests on piers composed of east iron cylinders sunk down in the rock and filled with concrete. Commencing with the Lydney shore, the spans are as follows:—one of 134 feet, two of 327, five of 171 feet, thirteen of 134, and one of 196 feet (inclusive of swing bridge over canal), making in all 22. The width of the river is 1186 yards, and the total length of the bridge, including the masonry viaduct and swing span, 1387 yards. While the main object of this stupendous undertaking is the transit of coal, arrangements are also contemplated for passenger traffic across the river.

Another canal, once of great importance to the commerce of Gloucestershire, is the Thames and Severn Canal, connecting the navigation of these two great rivers, the first of which rises at the back of Leckhampton Hill, at Seven Springs. The Thames and Severn canal begins at Lechlade on the former river, and joining the Stroudwater canal, which crosses the Gloucester and Berkeley, enters the Severn at Framilode. But this canal, though of considerable engineering skill, is now but little used, the Great Western railway having almost entirely superseded it; and it is the same with another canal running from the Severn at Gloucester to Newent and Ledbury.

*Manufactures.*—Gloucestershire is also an important manufacturing county. In the time of Edward III. the manufacture of woollen cloth was introduced into its hill country by the Flemings, attracted probably by the facilities offered for felting by the numerous streams of water flowing from the Cotteswolds. The manufacture gradually increased in spite of vexatious legislation, enacted with the view of encouraging native industry, but really tending to hamper the trade. Cirencester is mentioned as its seat in Henry IV.'s reign, and Stroud in 1553. The raw material for the manufacture was long obtained from the produce of English flocks, but afterwards a better description of wool was imported from Spain, and towards the close of the last century a still finer quality was got from Germany. The main supply is now obtained from the British colonies in the southern hemisphere. The description of cloth for which Gloucestershire and the west of England have been and still are most famous is broad-cloth, dressed with teazles to produce a short close nap on the face, and made of all shades of color, but chiefly black, blue, and scarlet. The most prosperous time of the Gloucestershire woollen trade was from 1800 to 1820, during which period the water-power of the various streams was keenly utilized, and a very large proportion of the population was engaged early and late on the several processes, either in their cottages or at the mills. The commercial crisis of 1825 very seriously crippled the trade; and though it afterwards recovered, it is probable that fewer persons have since been employed in it. The further introduction of machinery, enabling manufacturers to dispense with much manual labor, the passing of the factory laws, and the increased facilities of obtaining education, have greatly improved the social habits of the manufacturing population.

*History.*—Gloucestershire has not been unnoted in the annals of England. At Gloucester Henry III. was crowned; at Berkeley Castle Edward II. was murdered; the Wars of the Roses were ended at the battle of Tewkesbury, where in May, 1471, Queen Margaret and Prince Edward were taken prisoners; the repulse which Charles I. sustained at Gloucester, when the earl of Essex compelled him to raise the siege, was the climax of his fortunes. The county is strewn with relics of antiquity. Four Roman roads intersect it; Roman pavements and vestiges are found at Cirencester, Gloucester, Woodchester, and Lydney, and camps—British, Saxon, Danish, and Roman—in numerous places, with many interesting relics of the Middle Ages. Among these are the restored castle of Sudeley, near Winchcombe, a manor house before the Conquest, a baronial castle in the days of Stephen, and the home in succession of the Botelers, Seymours, Queen Katherine Parr, and the Chandos family; Thornbury Castle, an interesting ruin instead of a castellated palace, as it would have been had not its pretensions provoked the jealousy of Wolsey against its builder, Edward Stafford, duke of Buckingham, who was beheaded in 1521; St. Briavel's Castle, to the south of the Forest of Dean, an ancient seat of the Norman kings, if not the Saxon, which became the residence of the chief officer of the Forest, and retains in its ruined state a decorated chimney shaft surmounted by a horn, the warder's badge. Berkeley Castle, built prior to Henry II., is an almost unique specimen of a feudal residence in the actual occupation of a descendant of its founder, Baron Fitzharding. Edward II. was murdered in a detached upper chamber of the square tower. The chief mansions of the county are Badminton House (Duke of Beaufort); Oakley Park, Stroud (Earl Bathurst); Tortworth Park, with a chestnut measuring 52 feet, a boundary tree in King Stephen's reign (Earl Ducie); Sherborne Park, Northleach (Lord Sherborne); Clearwell Court, Coleford (Earl of Dunraven) Highnam Court (T. Gambier Parry); Sudeley Castle (J. Coucher Dent); Southam House, the oldest residential house in the county, built in the time of Henry VII., a timber and stone mansion of two stories (Earl of Ellenborough); and Prinknash Park, a 15th century residence of the abbots of Gloucester (B. St. John Ackers). Besides these there are various other seats of somewhat lesser size. Among the eminent persons born in the county are the chronicler Robert of Gloucester, Sebastian Cabot, William Cartwright the poet, Thomas Chatterton, Robert Southey, the Rev. John Eagles, and George Whitfield.

*Education.*—According to the parliamentary returns of public elementary schools for the year ending 31st August, 1875, there were in Gloucestershire 408 day schools, 34 of which were also used as night schools. Of these schools 314 were in connection with the Church of England, or the National Society or parochial; 15 were board schools, 9 Roman Catholic, 36 British and Foreign, and 13 Wesleyan Methodist Conference schools.

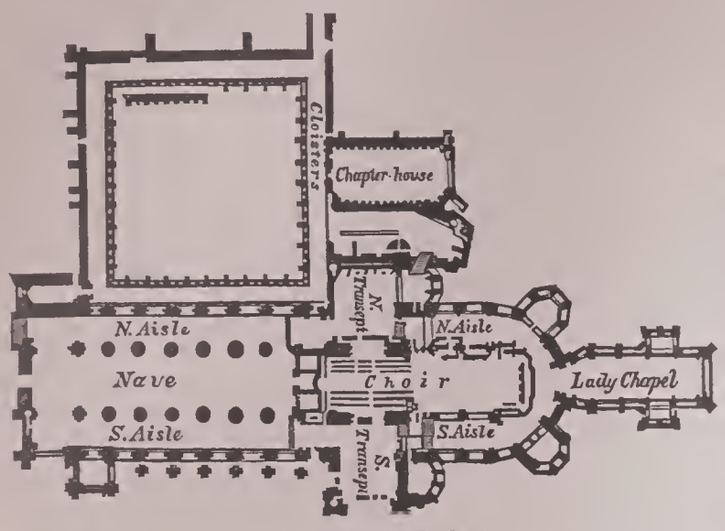
rives its name from the British Caer-Gloui, near which at Kingsholm the Romans formed their camp of Glevum, vestiges of which remain in four principal streets running N., S., E., and W., and crossing at the centre, as well as in Roman pavements, altars, coins, and pottery. A Roman station under Aulus Plautius, it became a city of Mercia, b name Gleauanceastre, under the Saxons, and is named



Gloucester Cathedral.

by Bede as one of the noblest cities in the land. A monastery was founded here in 679, in which in 1022 Bishop Wulstan of Worcester established the Benedictine rule. In the 8th century the city was repeatedly ravaged and burnt by the Danish invaders, and endured ruinous conflicts up to the time of the settlement between Canute and Edmund Ironside. The abbey throve from the time of Canute, the foundations of the present church having been laid by Abbot Serlo (1072–1104), and Walter Frocester, its historian, becoming its first mitred abbot in 1381. Edward the Confessor often resided at Gloucester, and it was a favor-

ite resort of the Norman kings, of whom Henry I. met with his death from a surfeit of lampreys, for which he acquired a taste there. Henry II. held a great council there and Henry III. was crowned in the abbey, and "loved Gloucester better than London." The "statutes of Gloucester" were passed in parliaments held there in succeeding reigns; but the tide of royal favor experienced an ebb when Charles I. subjected the city garrisoned by the Parliamentarians, to a critical siege, which was eventually raised in September, 1643, by the earl of Essex. Until 1541 the whole of Gloucestershire lay in Worcester diocese, but in that year it was constituted the see of Gloucester, with the abbey church for its cathedral, and John Wakeman, last abbot of Tewkesbury, for its first bishop. The cathedral may be succinctly described as "a Norman carcase," altered by additions in every style of Gothic architecture. It is 420 feet long, and 144 broad, with a beautiful central tower rising to the height of 225 feet, and topped by four graceful pinnacles. The nave is massive Norman with Early English roof; the cryp also, under the choir, aisles, and chapels, is Norman, as is also the chapter house. The south porch is Perpendicular, with fan-tracery roof, as also is the north transept, the south being transitional Decorated. The choir has Perpendicular tracery, and an apsidal chapel on each side, and the triforium carried under the east window in a curve, so as to form a whispering gallery, is very noteworthy. Between the apsidal chapels is a cross lady-chapel, and north of the nave are the cloisters with very early example of fan-tracery, the carols or stalls for the monks' study and writing lying to the south. The beautful tower is 15th century work. For several years an extensive process of restoration has been in progress. The finest monument is the canopied shrine of Edward II., who was brought hither from Berkeley. By the visits of pilgrims to this the building and sanctuary were enriched. At the step of the altar, too, is a monument in colored bog oak of Robert Curthose, a great benefactor to the cathedral, the eldest son of the Conqueror, who was interred there; and those of Bishop Warburton and Dr. Edward Jenner are also worthy of special mention. One of the oldest houses in the city is the "New Inn in the Northgate Street," a strong and massive timbered house with external galleries and court yards, built in 1450 for the pilgrims to Edward II.'s shrine, by Abbot Sebroke, a traditional subterranean passage leading thence to the cathedral. The timber is principally chestnut.

Gloucester is situated on a gentle eminence overlooking the Severn, and sheltered by the Coteswolds on the east, while the Malverns rise prominently to the west. The Tolsey or Guildhall stands at the cross, the point of intersection of the four principal streets, in each of which are various quaintly gabled and timbered houses, helping to preserve the ancient aspect of the city. The most modern quarter of it is in the region of the spa, to the south, where a chalybeate spring was discovered in 1814. The principal public buildings are the shire hall, the town hall or Tolsey (occupying the site of the ancient Roman capitol), the county jail and penitientiary, the East-gate market, the corn market, the infirmary, the lunatic asylum, and the hospital erected in 1861 in place of the four old almshouses. There are 14 churches and several dissenting chapels, and it may have been the olden proverb, "as sure as God's in Gloucester," which provoked Oliver Cromwell to declare that the city had "more churches than godliness." Of the churches four are of special interest: St. Mary de Lode, which is very old, and contains a monument of Bishop Hooper; St. Mary de Crypt, a cruciform structure of the 12th century, with a beautiful and lofty tower; the church of St. Michael, said to have been connected with the ancient abbey of St. Peter, and from whose tower the curfew bell is still rung every evening; and St. Nicholas church, originally of Norman erection, and possessing a tower and other portions of later date. A new episcopal palace was erected in 1862. There are three endowed schools: the College school, founded by Henry VIII., as part of the cathedral establishment; the Crypt school, founded by Dame Joan Cooke in the same reign; and Sir Thomas Rich's Blue Coat Hospital for 30 boys (1666). The first Sunday school was held in Gloucester, being originated by Robert Raikes. Gloucester has returned two members to parliament since the 23d year of Edward I. The city was chartered by Richard III., and is now governed by a mayor

six aldermen, and eighteen burgesses. Its ancient industries were iron-founding, cloth-making pin-making, and bell-founding, but the last two have been for some time discontinued. It now possesses iron and brass foundries, marble and slate works, chemical works, soap works, rope works, flour mills, manufactories of engines, machines, and agricultural instruments, and boat and ship-building yards. In 1877 the number of British ships that entered the port was 3762, with a tonnage of 272,391, and of foreign ships 549, with a tonnage of 167,200; the number of British ships that cleared was 3992, with a tonnage of 278,773, and of foreign ships 488, with a tonnage of 144,581. The principal imports are timber, corn, wine, and spirits, and the principal exports iron, coals, malt, salt, bricks, and pottery. The town is celebrated for its Severn salmon and lampreys. Near the canals and docks are the remains (a gateway and some walls) of Llanthony Priory, a cell of the mother abbey in the vale of Ewyas, Monmouthshire, which in the reign of Edward IV. had become the secondary establishment. The famous bore of the Severn attains its great height just below Gloucester. The area of the municipal borough is 415 acres, and of the parliamentary borough 1606 acres. The population of the municipal and parliamentary borough in 1861 was 16,512; that of the municipal borough in 1871 was 18,330, and of the parliamentary borough (extended since 1861) 31,804.

See *Handbook to the Cathedrals of England, Western Division*, 1864; *General Architectural Description of the Cathedral Church at Gloucester, with Plans and Sketches*, by Frederick S. Waller, F.R.I.B.A., 1856. (J. DA.)

GLOUCESTER, a city and port of entry of Essex county, Massachusetts, United States, is beautifully situated near the southern extremity of the peninsula of Cape Ann, 30 miles N. N. E. of Boston by rail. It includes six villages—Gloucester village, East Gloucester, West Gloucester, Annisquam, Bay View, and Lanesville. The harbor, opening out into Massachusetts bay, is one of the best on the coast, and is defended by a fort. The prosperity of Gloucester depends mainly on its cod and mackerel fisheries, which employ nearly 400 vessels, with upwards of 3500 men, and have an annual value of about 4,000,000 dollars. For the year ending June 30, 1878, the total value of imports was 81,450 dollars, of domestic exports 36,172 dollars, and of foreign exports 384 dollars. Steamers ply daily between the city and Boston. There are a number of manufactories connected chiefly with the fisheries, and in the neighborhood there are extensive granite quarries. Gloucester possesses a fine city hall, a high school, seven grammar schools, and a free library. On account of its attractive situation, and the fine scenery of the neighborhood, it is a favorite summer residence. About two miles from it is Norman's Woe, the scene of the wreck of the "Hesperus," celebrated in Longfellow's poem.

Gloucester received its name from the fact that many of its early settlers came from the county of Gloucester in England. It was occupied as a fishing station in 1624, was incorporated as a town in 1642, and was made a city in 1874. It was attacked by the English in 1775 and in 1814, in both cases unsuccessfully. The population in 1800 was 5313; in 1850, 7786; in 1860, 10,904; and in 1870, 15,389, of whom 4007 were foreigners, and in 1901, 26,121.

GLOUCESTER, ROBERT OF. See ROBERT OF GLOUCESTER.

GLOVE (Saxon *glof*), a covering for the hand, with a separate sheath for each finger. Among our ancestors, to throw down the glove or gauntlet was equivalent to a challenge to single combat, and the person thus defied signified his acceptance of the challenge by taking up the glove, and casting down his own,—which ceremony was regarded as a mutual compact to meet at the time and place specified. This custom, according to Favyn (*Théâtre d'Honneur et de Chevalerie*), was derived from the Oriental mode of contracting sales of land and the like by giving the purchaser a glove, by way of delivery or investiture; and to this effect he quotes Ruth iv. 7, and Psa. cviii. 9, passages where the word commonly translated "shoe" is by some rendered "glove." Du Cange quotes from a charter of the 13th century an instance of re-investiture or restitution symbolized by the person depositing his glove on the earth. The use of gloves is of high antiquity. There is reason to believe the ancient Persians wore them, since it is mentioned in the *Cyropædia* of Xenophon that on one occasion Cyrus went without his gloves; and we know that some kind of protecting coverings for the hands were used by the Greeks and Romans in certain kinds of manual labor, although their precise form is unknown.

The word *gantus*, used for a glove in mediæval Latin, is obviously of Teutonic derivation. In the life of St. Columbanus, written by Jonas, abbot of Bobbio, in the 7th century, gloves for protecting the hands in manual labor are spoken of as "tegumenta manuum quæ Galli *wantos* vocant." A pair of gloves are mentioned in the will of Bishop Riculfus, who died 915 A. D. Gloves did not become articles of ecclesiastical vestment till the 12th century. They do not appear in the Bayeux tapestry, and they did not come into general use in England till the 13th century. Matthew Paris, noticing the burial of Henry II. (1189), mentions that he was buried in his coronation robes, with a golden crown on his head and gloves on his hands. Gloves were also found on the hands of King John when his tomb was opened in 1797, and on the hands of Edward I. when his tomb was opened in 1774. In the 14th century they were in common use among the better classes. In the 16th century they were frequently embroidered with great elaboration, and in the reign of Charles II. the short sleeves of the ladies' dresses brought in long gloves reaching almost to the elbow. It is an old custom in England that a pair of gloves are given by the sheriff to the judge who presides at a maiden assize; and in Scotland white gloves are given to the judges on a maiden circuit,—that is, when there are no cases for trial.

The manufacture of gloves was early introduced into the British Islands, and such was the dignity of the craft that, as early as the reign of King Robert III., the incorporation of glovers of Perth was chartered—a wealthy guild still existing, although the calling has long ceased to characterize that town. The glovers' company of London received its armorial bearings as early as 1464, but the body was not chartered till 1638; and in Worcester, which has long been the principal British centre of the trade, a company was incorporated in 1661.

The glove industry of the present day is both extensive and diversified, seeing that gloves are now almost universally worn, and made of various classes of material and in several different ways. Of yarn, thread, silk, and cloth gloves it is unnecessary to speak, as these varieties are, in comparison with leather gloves, of comparatively little importance. The leather employed by glovers is prepared from the skins of deer, sheep and lambs, goats and kids—the last being by far the most important. The skins are prepared either by the ordinary processes of shamoying for wash-leather and doe or buck leather gloves, or by a special method of tawing in the case of ordinary dress gloves. The kid-skins are principally collected by hawkers in the South European countries, and sold in the Leipsic and Naples fairs. The tawing industry is conducted on a great scale at Annonay, Paris, and Milhau in France. The tawing process differs from ordinary tanning in the greater care and cleanliness of all the operations, in the submission of the dressed skins to a brief fermentation by piling them under the influence of heat, which increases the softness and flexibility of the leather, and in tawing with a mixture of flour, the yellow of eggs, and alum. On the completion of this operation, they are stretched by hand and dried as rapidly as possible. Thereafter they are damped, placed in dozens between linen cloths, and worked about to render them soft and pliable, after which they are planed on the flesh side, dried, and again planed. They are then polished by rubbing with a heavy glass disc or other smooth substance, and dyed by brushing liquid dyes over one side. Finally they are stretched on a marble table, and smoothed with a blunt knife. From a kid skin so prepared the materials of three gloves are obtained. The skins are moistened and stretched, and the various parts are cut out by a machine having steel punches the shape and size desired. The thumb piece, the quirks and the fourchettes inserted between the fingers, and the wrist welt—the latter frequently white—are cut out separately. Machine sewing, in which a kind of button stitch is made, is to a small extent utilized in the manufacture of gloves; but the greater part of the sewing is done by hand. The pieces to be sewn together are placed in a machine between a pair of jaws, the holding edge of which is composed of fine saw teeth, between each of which the sewer passes back and forward her needle, and in this way a neat uniform stitch is secured. There are three kinds of hand-sewing in the glove trade—round sewing or

ordinary glove stitch, piqué stitch, and prick seam. After sewing, the backs are stitched or tamboured, the button-hole is formed, the wrist attached, and the button sewed on, thus finishing the glove. After damping and stretching to its utmost length, the glove is ready to be stamped and put up for use.

Paris is, beyond question, the most important centre of glove-making, and for delicacy of material and beauty of workmanship the productions of some Parisian manufacturers are without any rivals; but it is at Grenoble that French gloves are most extensively manufactured. English gloves, of unfailing excellence of material and workmanship, are principally made at Worcester; and in one specialty—"dogskin" gloves made from Cape sheep-skin, having a warm tan color—English makers have no competitors. A very large quantity of cheap but useful gloves are made at Brussels and Copenhagen. During the year 1876, 1,084,400 dozen pairs, of a value of £1,380,884, were imported into the United Kingdom from France; from Belgium there were 301,305 dozen pairs, valued at £345,174; and the total imports from all quarters amounted to 1,497,437 dozen pairs, of a value of £1,840,956. In 1878 the total imports were 1,060,040 dozen pairs, valued at £1,302,060.

Buckskin gloves are largely made in the United States, and that branch, together with a limited production of kid and other gloves, is chiefly centred in the village of Gloversville, Fulton co., N. Y. It is estimated that from about 140 separate glove factories in that village not less than two-thirds of the gloves made in the United States are sent out. Kid gloves are made to some extent in New York city.

GLOVER, Richard (1712–1785), an English poet, was born in 1712. He was the son of a London merchant, and received his education at Cheam in Surrey. While there he wrote in his sixteenth year a poem to the memory of Sir Isaac Newton, which was appended by Dr. Pemberton to his *View of Newton's Philosophy*, published in 1728. Though Glover followed the business of his father, he devoted much of his attention to literary pursuits, and he acquired the reputation of being one of the best Greek scholars and most famous poets of his day. In 1737 he published an epic poem, *Leonidas*, written in celebration of the defence of Thermopylæ. As the praise of liberty formed the subject matter of the poem, it was thought to have a special reference to the politics of the time; and being warmly commended by the regent and his court, by Lord Lyttelton, and the novelist Fielding, it soon passed through several editions. Though exhibiting a well-cultivated taste and some skill in versification, it possesses, however, little poetical merit, and is totally wanting in the higher qualities of epic poetry. A continuation of the *Leonidas*, entitled *Atheniad*, subsequently appeared, but had little or no popularity. In 1739 Glover published a poem entitled *London, or the Progress of Commerce;* and in the same year, with a view to excite the nation against the Spaniards, he wrote a ballad, *Hosier's Ghost*, which is spirited and effective, and was one of the most popular of its day. He was also the author of two tragedies, *Boadicea* (1753) and *Medea* (1761), which, however, on account of their close imitation of Greek models, are unsuited for the modern stage. The success of Glover's *Leonidas* led him to take considerable interest in politics, and in 1760 he entered parliament as member for Weymouth, in which capacity his abilities as a speaker, and his knowledge of commercial questions, acquired for him considerable influence. He died in November, 1785. His diary, entitled *Memoirs of a distinguished literary and political Character from 1742 to 1757* was published in 1813. Glover is one of the reputed authors of *Junius;* but his claims—which were advocated in an *Inquiry concerning the author of the Letters of Junius with reference to the Memoirs, etc.*, published in 1815—rest on very slight grounds.

GLOWWORM. See Coleoptera, vol. vi. p. 120.

GLUCINUM, or Beryllium (Greek γλυκύς, sweet, from the taste of its salts), is a metal related most nearly in its physical properties to zinc and mercury, symbol G, atomic weight 9·3. It occurs in the beryl and emerald, $G_3Al_2Si_6O_{18}$, or $3GO,Al_2O_3,6SiO_2$ (see vol. iii. p. 530, and vol. viii. p. 156), from which its oxide was earliest obtained by Vauquelin in 1798; also in the minerals euclase ($H_2G_2Al_2Si_2O_{10}$, or $H_2O,2GO,Al_2O_3,2SiO_2$), phenacite ($G_2SiO_4$), chrysoberyl ($GO,Al_2O_3$), gadolinite, leucophanite, and helvite. Glucinum was first obtained by Wöhler and Bussy in 1828, in an impure pulverulent form, by the fusion of its chloride with potassium; and by Debray in 1854, in the compact state, by the decomposition in an atmosphere of hydrogen of the vapor of the chloride by that of sodium (*Ann. Chim. Phys.*, ser. iii. vol. xliv. 5). Heated in air the metal oxidizes superficially, or, if in a state of fine division, burns with brilliancy. The spark-spectrum of glucinum presents two brilliant blue lines. Glucinum may be estimated in minerals, after removal of their silica, in the insoluble form or as fluoride, by the separation of aluminium mostly as alum, what remains being then thrown down, with iron, by means of warm solution of ammonium carbonate; to the filtrate excess of hydrochloric acid is added; and finally the glucinum is precipitated as hydrate, $G(OH)_2$, which is washed, dried, and ignited. An alloy of glucinum with iron has been obtained by Davy and by Stromeyer.

On the chemistry of glucinum see further vol. v. pp. 456-8 and 470; also Watts, *Dict. of Chemistry*, ii.; W. Crookes, *Select Methods in Chemical Analysis*, pp. 45, 46, 66; and Roscoe and Schorlemmer, *Treatise on Chemistry*, ii. pt. 1, pp. 231–6.

GLUCK (not, as frequently spelt, Glück), Christopher Willibald (1714–1787), a celebrated operatic composer, was born at Heidenwang, near Neumarkt, in the Upper Palatinate, on July 2, 1714. He belonged to the lower middle class, his father being gamekeeper to Prince Lobkowitz; but the boy's education was not neglected on that account. From his twelfth to his eighteenth year he frequented the Jesuit school of Kommotow in the neighborhood of Prince Lobkowitz's estate in Bohemia, where he not only received a good general education, but also had lessons in music. At the age of eighteen Gluck went to Prague, where he continued his musical studies under Czernhorsky, and maintained himself by the exercise of his art, sometimes in the very humble capacity of fiddler at village fairs and dances. Through the introduction of Prince Lobkowitz, however, he soon gained access to the best families of the Austrian nobility, and when in 1736 he proceeded to Vienna, he was hospitably received at his protector's palace. Here he met Prince Melzi, an ardent lover of music, who invited Gluck to accompany him to Milan, where the young musician continued his education under Giovanni Battista San Martini, an interesting composer who, although self-taught, was one of the most accomplished musicians of the 18th century, and has been called the model of Haydn. His works belong chiefly to the class of chamber music. In this respect, however, the master's example was not followed by the pupil. Gluck's dramatic instinct was irrepressible, and soon we find him producing operas at the rapid rate necessitated by the omnivorous taste of the Italian public in those days. Eight of these works were produced at various Italian theatres between 1741 and 1745. Although favorably received, they were not much above the ordinary operatic level of the day, and it would be needless even to give their names. Only the first may be mentioned here, *Artaserse*, libretto by Metastasio, first performed at Milan in 1741. To the reputation thus acquired Gluck owed an invitation to London, where in 1745 he became composer for the opera house in the Haymarket. The first opera produced there was called *La Caduta dei Giganti*, 1746, words by Metastasio), followed by one of his earlier operas, re-written for the purpose. It is stated that he also appeared as a performer on the musical glasses. The success of the two operas, as well as that of a so-called *pasticcio*, or dramatic medley entitled *Piramo e Tisbe*, was anything but brilliant, and Gluck accordingly left London. But his stay in England, although not accompanied by immediate success, was not without important consequences for his subsequent career. Gluck at this time was neither more nor less than an ordinary producer of Italian opera. Handel's well-known saying that Gluck knew no more counterpoint than his (Handel's) cook, whether true or not, was unfair, for the reason that, if Gluck had known as much counterpoint as the author of *Israel in Egypt* himself, it would have been difficult to make use of it in the style of music then exclusively cultivated by him. Had the young composer been successful in the ordinary *opera seria*, there is every reason to fear that the great dramatic reform, initiated by him, would never have taken place. The critical temper of the London public fortunately averted this calamity. It may also be assumed that the musical atmosphere of the English capital, and especially the great works of Handel, were not without beneficial influence upon the young composer. But of still greater importance in this respect was

a short trip to Paris, where Gluck became for the first time acquainted with the classic traditions and the declamatory style of the French opera—the future scene of his own triumphs. Of these great issues little trace, however, is to be found in the works produced by Gluck during the fifteen years after his return from England. His first opera written for Vienna, called *La Semiramide reconosciuta* (1748), is again an opera seria of the ordinary kind, and little more can be said of *Telemacco* (Rome, 1749), *La Clemenza di Tito* (Naples, 1751), and numerous occasional pieces of a more or less serious kind written for the court at Vienna, where Gluck settled permanently in 1756, having two years previously been appointed court chapel-master, with a salary of 2000 florins, by the empress Maria Theresa. On a previous occasion he had received the order of knighthood from the pope, consequent upon the successful production of two of his works in Rome. During the long interval from 1756 (the date of his opera *Il Ré Pastore*) to 1762, Gluck seems to have matured his plans for the reform of the opera; and, barring a ballet named, like Mozart's opera, *Don Giovanni*, and some *airs nouveaux* to French words with pianoforte accompaniment, no compositions of any importance have to be recorded. His *pièce d' occasion*, *Il Trionfo di Clelia*, produced at Bologna in 1762, is still written in the old manner. But his *Orfeo ed Euridice*, played in October of the same year at Vienna, shows that the composer had entered upon a new career. It is significant that in the original score the work is described as a "dramma per musica" or music-drama, the title opera seria being avoided. Gluck also for the first time had deserted Metastasio, and Raniero Calzabigi furnished the highly dramatic book of *Orpheus*. Quite apart from its significance in the history of dramatic music, *Orpheus* is a work which, by its intrinsic beauty, commands the highest admiration, and does not fail to impress an audience, even now, wherever an adequate representative of the title-part can be found. Orpheus's air, "Che faro," is known to every one; but finer even is the great *scena* in which the poet's song softens even the *ombre sdegnose* of Tartarus. The ascending passion of the entries of the solo (Deh! placatevi; Mille pene; Men tiranne), interrupted by the harsh but gradually-softening exclamations of the Furies, is of the highest dramatic effect. These melodies, moreover, as well as every declamatory passage assigned to Orpheus, are made subservient to the purposes of dramatic characterization; that is, they could not possibly be assigned to any other person in the drama, any more than Hamlet's monologue could be spoken by Polonius. It is in this power of musically realizing a character—a power all but unknown in the opera of his day—that Gluck's genius as a dramatic composer is chiefly shown. After a short relapse into his earlier manner, Gluck followed up his *Orpheus* by a second classical music-drama named *Alceste*, and first produced in December, 1767, at Vienna. In his dedication of the score to the grand-duke of Tuscany, Gluck has fully expressed his aims, as well as the reasons for his total breach with the old traditions. "I shall try," he writes, "to reduce music to its real function, that of seconding poetry by intensifying the expression of sentiments and the interest of situations without interrupting the action by needless ornament. I have accordingly taken care not to interrupt the singer in the heat of the dialogue, to wait for a tedious *ritornel*, nor do I allow him to stop on a sonorous vowel, in the middle of a phrase, in order to show the nimbleness of a beautiful voice in a long *cadenza*." Such theories, and the stern consistency with which they were carried out, were little to the taste of the pleasure-loving Viennese; and the success of *Alceste*, as well as that of *Paris and Helena*, which followed two years later, was not such as Gluck had desired and expected. He therefore eagerly accepted the chance of finding a home for his art in the centre of intellectual and more especially dramatic life—Paris. Such a chance was opened to him through M. Bailli du Rollet, attaché of the French embassy at Vienna, and a musical amateur who entered into Gluck's ideas with enthusiasm. A classic opera for the Paris stage was accordingly projected, and the friends fixed upon Racine's *Iphigénie en Aulide*. After some difficulties, overcome chiefly by the intervention of Gluck's former pupil, the dauphiness Marie Antoinette, the opera was at last accepted and performed at the Académie de Musique, on April 19, 1774. The great importance of the new work was at once perceived by the musical amateurs of the French capital, and a hot controversy on the merits of *Iphigénie* ensued, in which some of the leading literary men of France took part. Amongst Gluck's opponents were not only the admirers of Italian vocalization and sweetness, but also the adherents of the earlier French school, who refused to see in Gluck the legitimate successor of Lulli and Rameau. Marmontel, Laharpe, and D'Alembert were opponents, the Abbé Arnaud and others the enthusiastic friends of the German master. Rousseau took a peculiar position in the struggle. In his early writings he is a violent partisan of Italian music, but when Gluck himself appeared as the French champion he willingly acknowledged the great composer's genius. In a letter to Dr. Burney, written shortly before his death, Rousseau gives a close and appreciative analysis of the *Alceste*, the first Italian version of which Gluck had submitted to him for suggestions; and when, on the first performance of the piece not being received favorably by the Parisian audience, the composer exclaimed, "*Alceste* est tombée," Rousseau is said to have comforted him with the flattering *bonmot*, "Oui, mais elle est tombée du ciel." The contest received a still more personal character when Piccini, a celebrated and by no means incapable composer, came to Paris as the champion of the Italian party. Into the details of the historic battle between Gluckists and Piccinists this is not the place to enter. Volumes have been written on the subject, and the whole affair has been denounced as a sign of the frivolity of the eighteenth century. But to those interested in music and in the drama, the question whether the vocal virtuoso or the true dramatic artist should reign on the lyrical stage is by no means without importance; although, perhaps, the gentlemen of the queen's court, and their friends who applauded her countryman and protegé Gluck from "le coin de la reine," hardly looked upon the matter in so serious a light. The victory at last remained, by common consent (including, it is said, Piccini's own), with Gluck. The succession of the operas written for Paris is the following:—*Orphée et Eurydice* (the *Orfeo* rewritten), 1774; *Alceste* (also an adaptation of the earlier work), 1776; *Armide*, 1777; *Iphigénie en Tauride*, 1779. Some minor compositions, written partly by desire of the queen for the court festivals, it would be needless to mention. Gluck was engaged upon an opera, *Les Danaïdes*, when an attack of apoplexy compelled him to relinquish all thoughts of work. He left Paris for Vienna, where he lived for several years in dignified leisure, disturbed only by his declining health. He died on November 18, 1787.

To the general character of Gluck's music some allusion has already been made. He was essentially a dramatic composer, and no notice need be taken of the few works belonging to a different sphere. In connection with its dramatic purpose his music ought always to be judged. He never was a great contrapuntist in the sense that Bach and Handel were. But neither was there much room for polyphonous display in the music-drama as he understood it. The chorus of Scythians in the second *Iphigenia* ("Il nous falloit du sang") would not gain in effect if it contained an elaborate fugue. This and other choruses in the same great work at the same time illustrate Gluck's power of rendering musically national as well as individual characteristics. As a masterly trait of psychological characterization may further be cited the accompaniment to Orestes's air, also in *Iphigénie en Tauride* ("Le calme rentre dans mon cœur"), where the unfortunate man in vain tries to find relief from the pangs of conscience, distinctly heard in the unceasing semiquavers of the orchestral accompaniment. The severe censure passed on Gluck for drowning the voices by the instruments posterity has converted into one of the composer's highest claims to fame. Not only has Gluck developed the orchestra as regards mere beauty and volume of sound, but he also has made it an important factor in the dramatic organism. Instances from the second *Iphigénie* alone might again be multiplied. The savage Scythians, for instance, are characterized by the noise of brass and percussion: while Iphigénie's simple prayer is accompanied by the strings and two oboes. The care bestowed by Gluck upon a correct and emphatic declamation of the words is another important point in his dramatic reform. Readers interested in the matter will have noticed the striking parallelism between the views and aims advocated by Gluck in the 18th century and by Wagner in the 19th century—a parallelism which may be extended to the bitter animadversions evoked by these theories amongst contemporary critics. The means, however, by which the theories

were to be realized are very different in the two cases. Gluck's reform is essentially directed against the encroachments of the singer; Wagner's against those of the composer as an independent artist. Gluck, it is true, felt the necessity of a perfect unity between music and poetry, but he never intended to bring about this desirable effect by surrendering any of the strict forms of his own art. The consequence was that the poet was more than ever bound to adapt his work to the demands of the composer, and that the latter remained practically the omnipotent ruler on the operatic stage. Wagner at last has made dramatic purpose the supreme consideration to which the forms of music, as a separate art, have to submit.

An altogether satisfactory biography of Gluck remains still o be written. With regard to the life, Anton Schmid's *Chr. W. Ritter von Gluck* may be consulted. Herr Marx, in his *Gluck und die Opera*, has attempted to define the composer's position in the history of dramatic music. M. Desnoiresterres's *Gluck et Piccini* refers to the most important portion of the composor's career. For it must always be remembered that Gluck, although a German by birth, belongs as an artist to Franco rather than to his native country. His works form as it were the musical complement to the tragedy of Corneille and Racino. In France he was first appreciated, and in France also his traditions were continuod by a school of highly gifted composers. (F. H.)

GLÜCKSTADT, a town of Prussia, in the province of Schleswig-Holstein, is situated on the right bank of the Elbe, where it receives the small river Rhin, and on the railway from Itzehoc to Elmshorn, 28 miles N. W. of Altona. It has a Protestant and a Catholic church, a synagogue, a gymnasium, a provincial prison, and a provincial penitentiary. The inhabitants are chiefly engaged in commerce and fishing; but the frequent losses from inundations have greatly retarded the prosperity of the town. It suffers at the same time from a very deficient water supply for culinary purposes.

Glückstadt was founded by Christian IV. of Denmark in 1616, and fortified in 1620. It was formerly the seat of the royal dukes of Schleswig-Holstein, who assumed from it the name of Holstein-Glückstadt. In 1627–8 it was besieged for fifteen weeks by Tilly, without success. In 1814 it was blockaded by the allies and capitulated, whereupon its fortifications were demolished. In 1830 it was made a free port. It came into the possession of Prussia along with the rest of Schleswig-Holstein in 1866. The population in 1901 was 6218.

GLUCOSE, a species of sugar, on the chemical and other properties and the occurrence and manufacture of which see articles CHEMISTRY, vol. v. pp. 490, 497; DEXTRIN and DIABETES, vol. vii. pp. 126, 127; FERMENTATION, vol. ix. pp. 82, 84, 85; GALLIC ACID, vol. x. p. 37; and SUGAR.

GLUE. See GELATIN.

GLUKHOFF, or GLUCHOW, as the name is transliterated in German, a town of Russia, at the head of a district in the government of Tchernigoff, 132 miles E. of Tchernigoff in 51° 54′ N. lat. and 33° 35′ E. long., on the highway between Moscow and Kieff. It is situated on the sloping banks of the Yasmin, a sub-tributary of the Desna, which in its turn unites with the Dnieper. Among its buildings are eleven churches and two Jewish meeting-houses, a district school, an almshouse, and a hospital. In 1860 its population, mainly engaged in agricultural pursuits and petty commerce, amounted to 10,008, of whom 4998 were males; in 1873 it was 10,747; and according to the *St. Petersburg Calendar* for 1878, it has increased to 13,398. The Jews in 1860 numbered 2517. About 4 miles from the town, near the village of Poloshek, there exists an extensive deposit of white clay, which supplies nearly all the porcelain factories in Russia. Glukhoff is mentioned in the Laurentian Chronicle as early as 1152. For some time it was in the hands of a branch of the ducal family of Tchernigoff, which retired before the encroachments of the Tartars in the middle of the 13th century. Before its final incorporation with Russia, it passed under the sway first of the Lithuanians and then of the Poles. On the destruction of Baturin by Peter I. in 1708, it was made the residence of the hetmans. Population in 1901, 14,900.

GLUTEN, a tough, tenacious, ductile, somewhat elastic, nearly tasteless, and greyish-yellow albuminous substance, obtained from the flour of wheat by washing in water, in which it is insoluble. In Martin's apparatus for the preparation of gluten on a large scale, balls of dough are worked backwards and forwards in troughs by means of cylinders, whilst water plays upon them in fine jets delivered by copper pipes. A sack of flour may be thus made to yield about 110 lb of moist gluten, and twice that quantity of dry starch. Good samples of white English wheat contain some 10 or 11 per cent. of gluten; from hard Venezuela wheat as much as 22·75 per cent. has been procured. The outer and inner coats of wheat, separated from it as bran, contain respectively 4 or 5 and 14 to 20 per cent. of gluten. Gluten, when dried, loses about two-thirds of its weight, becoming brittle and semi-transparent; when strongly heated it crackles and swells, and burns like feather or horn It is soluble in strong acetic acid, and in caustic alkalies, which latter may be used for the purification of starch in which it is present. When treated with ·1 to ·2 per cent. solution of hydrochloric acid it swells up, and at length forms a liquid resembling a solution of albumin, and lævorotatory as regards polarized light. Moistened with water and exposed to the air gluten putrefies, and evolves carbon dioxide, hydrogen, and sulphuretted hydrogen, and in the end is almost entirely resolved into a liquid, which contains leucin and ammonium phosphate and acetate. On analysis gluten shows a composition of about 53 per cent. of carbon, 7 per cent. of hydrogen, and nitrogen 15 to 18 per cent., besides oxygen, and about 1 per cent. of sulphur, and a small quantity of inorganic matter. It is not a simple substance, and according to Ritthausen consists of *glutencasein* (Liebig's vegetable fibrin), *glutenfibrin*, *gliadin* (Pflanzenleim), *glutin* or vegetable gelatin, and *mucedin*, which are all closely allied to one another in chemical composition. It is the gliadin which confers upon gluten its capacity of cohering to form elastic masses, and of separating readily from associated starch. In the so-called gluten of the flour of barley, rye, and maize, this body is absent (Kreusler and Ritthausen). The gluten yielded by wheat which has undergone fermentation or has begun to sprout is devoid of toughness and elasticity. These qualities can be restored to it by kneading with salt, lime-water, or alum. Koopmans found that a larger amount of raw gluten was digested in a relatively dilute than in a strong artificial gastric juice, the reverse holding good of albumin. From experiments on six pigs and three dogs, he came to the conclusion that the digestive fluid in the stomachs of living animals, even of the same species, dissolves unlike quantities of albumin and gluten, so that if much albumin be digested the loss of weight of gluten present with it is but small, and *vice versa* (see *Brit. and For. Med.-Chir. Rev.* 1857, ii pp. 318–25). Gluten is employed in the manufacture of gluten bread and biscuits for the diabetic (see DIABETES, vol. vii. p. 128), and of chocolate, and also in the adulteration of tea and coffee. For making bread it must be used fresh, as otherwise it decomposes, and does not knead well. Granulated gluten is a kind of vermicelli, made in some starch manufactories by mixing fresh gluten with twice its weight of flour, and granulating by means of a cylinder and contained stirrer, each armed with spikes, and revolving in opposite directions. The process is completed by the drying and sifting of the granules.

Ritthausen, "Ueber die Bestandtheile des Weizenklebers," *Erdmann's Journ. f. praktische Chemie*, lxxxv., 1862, pp. 193–229; also *ib.*, lxxxvi., 1862, pp. 257–265; and lxxxviii., 1863, pp. 141–147; T. Langer, *Lehrbuch der Chemie*, pp. 361–371, Leipsic, 1878; and Payen, *Industrial Chemistry*, ed. B. H. Paul, 1878.

GLUTTON or WOLVERENE (*Gulo luscus*), a carnivorous mammal, belonging to the *Mustelidæ* or weasel family, but differing from the typical forms of the genus *Mustela* in the greater heaviness and clumsiness of its body, presenting in this respect a striking resemblance to the bear. Its legs are short and stout, with large feet, the toes of which terminate in strong, sharp claws, considerably curved. Its mode of progression is semi-plantigrade. In size and form it is not unlike the European badger, measuring from 2 to 3 feet in length, exclusive of the thick bushy tail, which is about 8 inches long. Its head is broad, its eyes small, with defective vision, and its back arched. Its fur consists of an undergrowth of short woolly hair mixed with long straight hairs, to the abundance and length of which on the sides and tail the creature owes its shaggy appearance. The color of its fur is blackish-brown, with a broad band of chestnut color stretching from the shoulders along each side of the body, the two meeting near the root of the tail; while, unlike the majority of arctic animals, the fur of the

glutton in winter-time grows darker in color. Like other weasels it is provided with anal glands, which secrete a yellowish fluid possessing a highly fœtid odor. The glutton is a boreal animal, inhabiting the northern regions of both hemispheres, but most abundant in the circumpolar area of the New World, where it occurs throughout the British provinces and Alaska, being specially numerous in the neighborhood of the Mackenzie River, and extending southwards as far as New York and the Rocky Mountains. Many erroneous statements have been made regarding the glutton by early writers on natural history, from Olaus Magnus to Buffon, one of which has perpetuated itself in the animal's common name.—the fact being that the wolverene is not more gluttonous than are the majority of carnivorous animals. It feeds on grouse and the smaller rodents, and on foxes, which it digs from their burrows during the breeding season. Its want of activity, however, renders it dependent for most of its food on the dead carcases of animals. These it frequently obtains by methods which have made it peculiarly obnoxious to the hunter and trapper. Should the hunter, after succeeding in killing his game, leave the carcase insufficiently protected for more than a single night, the glutton, whose fear of snares is sufficient to prevent him from touching it during the first night, will, if possible, get at and devour what he can of it on the second, hiding the remainder beneath the snow. He annoys the trapper by following up his lines of marten

Glutton, or Wolverene.

traps which often extend to a length of 40 or 50 miles, each of which he enters from behind, extracting the bait, pulling up the traps, and devouring or concealing the entrapped martens. So persistent is the glutton in this practice, when once it discovers a line of traps, that its extermination along the trapper's route is a necessary preliminary to the successful prosecution of his business. This is, however, no easy task, as the glutton is too cunning to be caught by the methods successfully employed on the other members of the weasel family. The trap generally used for this purpose is one made to resemble a cache, or hidden store of food, such as the Indians and hunters are in the habit of forming, the discovery and rifling of which is one of the glutton's most congenial occupations,—the bait, instead of being paraded as in most traps, being in this case carefully concealed, to lull the knowing beast's suspicions. One of the most prominent characteristics of the wolverene is its propensity, akin to that of certain members of the crow family, to steal and hide things, not merely food which it might afterwards need, or traps which it regards as personal enemies, but articles which cannot possibly have any interest for it except that of curiosity. An amusing instance of this is quoted by Coues in his valuable work, recently published, on the *Fur-bearing Animals of North America*, in which he says—"A hunter and his family having left their lodge unguarded during their absence, on their return found it completely gutted—the walls were there, but nothing else. Blankets, guns, kettles, axes, cans, knives, and all the other paraphernalia of a trapper's tent had vanished, and the tracks left by the beast showed who had been the thief. The family set to work, and by carefully following up all his paths, recovered, with some trifling exceptions, the whole of the lost property." The cunning it displays in unravelling the oftentimes complicated snares set for it forms at once the admiration and the despair of every trapper, while its great strength and ferocity render it a dangerous antagonist to animals much larger than itself and occasionally even to man. The rutting season occurs in March, and the female, secure in her burrow, produces her young—four or five at a birth—in June or July. In defence of these she is exceedingly bold, and the Indians according to Coues, "have been heard to say that they would sooner encounter a she-bear with her cubs than a carcajou (the Indian name of the glutton) under the same circumstances." The wolverene has a curious habit which has not hitherto been observed in any other of the lower animals. On catching sight of its relentless human enemy it may be observed, before finally determining on flight, sitting on its haunches, and, in order to get a clearer view of the danger, shading its eyes with one of its forepaws. When pressed for food it becomes fearless, and has then been known to come on board an ice-bound vessel, and in presence of the crew to seize on a canister of meat. The flesh of the glutton is uneatable; it is therefore only valuable for its fur, which, when several skins are sewn together, forms elegant hearth and carriage rugs.

GLYCAS, Michael, a Byzantine historian, often called Siculus. The time when he flourished is very uncertain. He is justly reckoned among the better Byzantine historians on account of the terseness and perspicuity of his style. His MS. letters still extant are addressed to the last Constantine; their authenticity, however, has been questioned. His chief work is *Βίβλος χρονική*, divided into four parts, treating of history from the creation of the world to the death of Alexis I. Comnenus (1118). The best edition is that by J. Bekker, in the Bonn collection of the Byzantines (1836).

GLYCERIN, Glycerine, or Glycerol (in pharmacy Glycerinum), a sugar-like substance obtainable from most natural fatty bodies by the action of alkalies and similar reagents, whereby the fats are decomposed, water being taken up, and glycerin being formed together with the alkaline salt of some particular acid (varying with the nature of the fat). Owing to their possession of this common property, these natural fatty bodies and various artificial derivatives of glycerin, which behave in the same way when treated with alkalies, are known as *glycerides*. This decomposition into an organic acid and a substance of more or less neutral character is a typical kind of reaction with numerous classes of organic bodies, and is termed *saponification*, from the circumstance that the ordinary process of soap-making consists simply in the formation from natural fatty bodies and alkalies of the alkaline salts of the fatty acids thence derivable, soap being a mixture of these alkaline salts in various proportions, according to the particular purposes for which it is required, and its price. In the ordinary process of soap-making the complementary product, glycerin, remains dissolved in the aqueous liquors from which the soap is separated, and is usually thrown away; in many other instances, however, in which a substance capable of undergoing a reaction of saponification is thus treated, the product complementary to the alkaline salt is the more important of the two.

The fact that soap is obtainable by boiling together oily or fatty substances and alkalies (such as potashes and natron or mineral alkali) was known at an early period of history, being mentioned by Pliny, Galen, Aetius, and Paulus Ægineta. On the other hand, substances referred to in the Old Testament and translated "soap" (*e. g.*, Jeremiah ii. 22, "For though thou wash thee with nitre [properly, natron], and take thee much soap;" Malachi iii. 2, "For he is like a refiner's fire, and like fuller's soap") refer to the alkali itself (viz., *borith* = vegetable alkali, potash; or *neter* = mineral alkali, soda), and not to the substances prepared from oily bodies and these alkaline matters. Similarly Homer makes no mention of soap whilst describing the laundry operations of Nausicaa. The discovery of glycerin, however, is of modern origin, the body having been first described in 1776 by Scheele under the name of oelsüss (principe doux des huiles—sweet principle of oils), and more fully investigated subsequently by Chevreul, Berthelot, and many other chemists, from whose researches it results that glycerin is a trihydric alcohol indicated by the formula $C_3H_5(OH)_3$, the natural fats and oils, and the glycerides

generally being substances of the nature of compound ethers formed from glycerin by the replacement of the hydrogen of the OH groups by the radicals of certain acids, called for that reason "fatty acids."[1] The relationship of these glycerides to glycerin will be more conveniently shown by an example, such as the series of bodies formed from glycerin by replacement of hydrogen by "stearyl" ($C_{18}H_{35}O$), the radical of stearic acid ($C_{18}H_{35}O.OH$):—

| Glycerin. | Monostearin. | Distearin. | Tristearin. |
|---|---|---|---|
| $CH_2.OH$ | $CH_2.O(C_{18}H_{35}O)$ | $CH_2.O(C_{18}H_{35}O)$ | $CH_2.O(C_{18}H_{35}O)$ |
| $CH.OH$ | $CH.OH$ | $CH.O(C_{18}H_{35}O)$ | $CH.O(C_{18}H_{35}O)$ |
| $CH_2.OH$ | $CH_2.OH$ | $CH_2.OH$ | $CH_2.O(C_{18}H_{35}O)$ |

These four substances evidently form a progressive series, each number of which differs from the preceding one in the same way, viz., that one more stearyl group replaces hydrogen in the original OH groups.

The process of saponification may be viewed as the gradual progressive transformation of tristearin, or some analogously constituted substance, into distearin, monostearin, and glycerin, or as the similar transformation of a substance analogous to distearin or to monostearin into glycerin. If the reaction is brought about in presence of an alkali, the acid set free becomes transformed into the corresponding alkaline salt; but if the decomposition is effected without the presence of an alkali (*i. e.*, by means of water alone, or by an acid fluid), the acid set free and the glycerin are obtained together in a form which usually admits of their ready separation. It is noticeable that with few exceptions the fatty and oily matters occurring in nature are substances analogous to tristearin, *i. e.*, they are trebly replaced glycerins. Amongst these glycerides may be mentioned the following:

*Tristearin*—$C_3H_5(O.C_{18}H_{35}O)_3$. The chief constituent of hard animal fats, such as beef and mutton tallow, etc.; also contained in many vegetable fats in smaller quantity.

*Triolein*—$C_3H_5(O.C_{18}H_{33}O)_3$. Largely present in olive oil and other saponifiable vegetable oils and soft fats; also present in animal fats, especially hog's lard.

*Tripalmitin*—$C_3H_5(O.C_{16}H_{31}O)_3$. The chief constituent of palm oil; also contained in greater or less quantities in human fat, olive oil, and other animal and vegetable fats.

*Triricinolein*—$C_3H_5(O.C_{18}H_{33}O_2)_3$. The main constituent of castor oil.

Other analogous glycerides are apparently contained in greater or smaller quantity in certain other oils. Thus in cows' butter, *tributyrin*, $C_3H_5(O.C_4H_7O)_3$, and the analogous glycerides of other readily volatile acids closely resembling butyric acid, are present in small quantity; the production of these acids on saponification and distillation with dilute sulphuric acid is utilized as a test of a purity of butter as sold. *Triacetin*, $C_3H_5(O.C_2H_3O)_3$, is apparently contained in cod-liver oil. Some other glycerides isolated from natural sources are analogous in composition to tristearin, but with this difference, that the three radicals which replace hydrogen in glycerin are not all identical; thus kephalin, myelin, and lecithin are glycerides in which two hydrogens are replaced by fatty acid radicals, and the third by a complex phosphoric acid derivative. In no case, however, is the existence of a natural glyceride analogous to distearin or monostearin substantiated with certainty, bodies of these classes being either formed synthetically by reversing the reactions of saponification, or being produced by the partial saponification of substances analogous to tristearin.

Glycerin is also a product of certain kinds of fermentation, especially of the alcoholic fermentation of sugar; thus it is a constituent of many wines and other fermented liquors, being formed together with small quantities of various other substances by reactions subsidiary only to the main change taking place, and hence varying in their nature and extent with circumstances. According to Pasteur, about $\frac{1}{30}$th of the sugar transformed under ordinary conditions in the fermentation of grape juice and similar saccharine liquids into alcohol and other products becomes converted into glycerin. In certain natural fatty substances, *e. g.*, palm oil, it exists in the free state, so that it can be separated by washing with boiling water, which dissolves the glycerin b not the fatty glycerides; but how far its occurrence in this form is due to the breaking up of the glyceride by a spontaneous saponification is open to some question.

*Properties.*—In a state of purity glycerin is a viscid, colorless liquid of sp. gr. 1·264, possessing a somewhat mawkish sweet taste; when exposed to a high degree of cold for a long time it sometimes solidifies to a crystalline mass, which then melts at about 7° C. The crystals when once melted often do not resolidify again readily, even when in contact with the solid substance, although sometimes contact with a crystal of the solid at a temperature of about 0° suffices to produce solidification of the whole. This solidification of glycerin is, however, a very exceptional phenomenon, only occurring with extremely pure substance under certain conditions not thoroughly understood, and then only after long continued exposure to a low temperature, as during a cold winter. When containing a minute quantity of water glycerin never solidifies, and to this circumstance several of its useful applications are due. A weak aqueous solution, when chilled sufficiently, allows crystals of ice to form, the glycerin accumulating in the unfrozen portion as alcohol does when a mixture of spirit and water is partially frozen. When heated alone it partially volatilizes, but the greater part decomposes; by reducing the pressure to about $\frac{1}{17}$th of an atmosphere, it can, however, be readily distilled unchanged, boiling under a pressure of 50 millimetres of mercury at about 20° C. In an atmosphere of steam, also, it distils without decomposition under ordinary barometric pressure. In water and alcohol it dissolves readily in all proportions; in ether it is insoluble. Under certain conditions, such as prolonged contact with poor cheese and chalk at about 35° to 40° C., it can be made to ferment partially, becoming changed into alcohol; but under any circumstances, only a small fraction, at most a tenth, becomes thus transformed, the rest remaining unaltered. It possesses remarkable solvent powers on many substances, whence it is employed for numerous purposes in pharmacy and the arts. Its viscid character, and its non-liability to dry and harden by exposure to air, also fit it for various other uses, such as lubrication, etc., whilst its peculiar physical characters, enabling it to blend with either aqueous or oily matters under certain circumstances, render it a useful ingredient in a large number of products of varied kinds. Applied to the living skin (and similarly to untanned leather) it produces a remarkable softening effect, whence it is largely employed as a cosmetic, either by itself or in admixture with other substances. Taken internally it is alleged to be valuable as a substitute for cod-liver oil for phthisical patients, not possessing the disagreeable fishy flavor of that valuable food, and having a fattening tendency. When it is given in moderately small repeated doses to the lower animals, it does not appear to possess any marked injurious action peculiar to itself; when, however, large doses of glycerin are subcutaneously injected into dogs, amounting to from 8 to 10 grammes per kilogramme of animal operated on (0·8 to 1·0 per cent. of the weight of the dog, corresponding to from 1 lb to 1½ lb of glycerin for the weight of an average man), death ensues within twenty-four hours, accompanied by symptoms analogous to those of acute alcoholism (Dujardin, Beaumetz, and Audigé). Like sugar it possesses antiseptic qualities, so that meat, albumin, etc., immersed in it do not for long periods of time undergo putrefactive changes.

*Manufacture.*—The simplest modes of preparing glycerin in a state of purity are based on the saponification of fats, either by alkalies or analogous basic substances, or by superheated steam, and on the circumstance that, although glycerin cannot be distilled by itself under the ordinary pressure without decomposition, it can be readily volatilized in a current of superheated steam; in this way the glycerin formed is separated from the non-volatile substances present. It was by means of saponification of olive oil or lard with litharge (lead oxide), whereby a lead soap insoluble in water, or nearly so, is formed, together with glycerin, that the existence of glycerin was first demonstrated by Scheele, who obtained it as a bye-product in the formation of the "lead-plaster" of pharmacy made from lard and lead oxide. For a long time this was the only known method of preparing glycerin, the aqueous solution obtained being treated with sulphuretted hydrogen to remove any soluble lead compounds, filtered, and evaporated until almost all the water was driven off, leaving the glycerin behind as a syrupy fluid. By evaporating down the spent leys of the soapmaker (after the soap is separated therefrom by 'salting out," and any

[1] The name is often further extended so as to embrace other acids, analogous to the true acids of fats and oils in composition, properties, and chemical characters, but not yet found to exist in natural oils and fats.

excess of alkali neutralized with sulphuric acid), and treating the residue with alcohol, glycerin can also be obtained, the alcoholic solution of it thus formed being simply evaporated to drive off the alcohol; but this process is far too costly for ordinary purposes. An improvement on this method was patented in 1858 by H. Reynolds, the concentrated leys being passed into a vessel where they are met by a stream of superheated steam at about 200° C.; the glycerin then passes over with the aqueous vapor, whilst the inorganic salts present are left behind. In the manufacture of stearic acid for candle-making (see CANDLE) one of the older processes was the saponification of tallow with lime, forming an insoluble lime soap and an aqueous solution of impure glycerin, from which the pure substance can be readily obtained by distillation with superheated steam. Less pure products were formerly obtained by treating the crude solution with sulphuric acid to separate lime, boiling to remove small quantities of volatile acids, evaporation, and filtration through animal charcoal to decolorize; or by evaporating, dissolving out by alcohol, and purifying by treating with lead oxide, filtering to separate an insoluble lead compound formed, removing lead from this filtrate by sulphuretted hydrogen, filtering again, and evaporating to a syrup. In practice all these older methods have, however, been superseded by the process patented in 1854 by Wilson & Payne. This consists in heating the fatty matter to be saponified in an appropriate still to a temperature of 290° to 315° C. (554° to 599° Fahr.), and passing in heated steam in such a way that it rises up through the fatty matter in numerous streams; saponification is thus rapidly effected, and the liberated glycerin and fatty acids are volatilized and carried along with the steam to the condensing arrangement. If the temperature do not exceed 310° C. there is no fear of the glycerin being decomposed, whilst under suitable conditions even higher temperatures than this can be employed without causing its decomposition; but there is always a great liability to destruction of glycerin when the temperature of 310° is exceeded. This arises from the tendency of the glycerin to char on heating, and to split up into water and *acrolein* (acrylic aldehyde), thus:—

$$C_3H_8O_3 = 2H_2O + C_3H_4O.$$

When a series of chambers is used as the refrigerator, the compartments nearest the still are found to condense little but fatty acids, the water and glycerin chiefly accumulating in the more distant chambers, the last of which is usually open to the air at the end; so that there is no excess of pressure in the still and condensers; the fatty acids readily separate from the aqueous solutions of glycerin, which only requires concentration by evaporation to be fit for the market. Since the date of Wilson's patent various special forms of apparatus for effecting the transformation have been patented by Wright & Fouché, Gilbee, and others.

This method of saponification is, strictly, only an improvement on former processes invented for the purpose of decomposing the glycerides and obtaining the fatty acids without the use of alkalies, lime, etc.; in these older methods the extraction of glycerin was not an important feature, and they were frequently worked in such a way as to decompose the whole or greater part of the glycerin *pari passu* with its liberation. Thus, as far back as 1825, Chevreul and Gay-Lussac sketched out the idea of the process of saponification by superheated steam, and the method was actually carried out with certain modifications by various chemists and manufacturers. For example, in 1842, E. Price & Co. patented, in the name of Jones & Wilson, a process of the kind, which was largely worked for some years; in this, the fatty matter freed from extraneous impurities is mixed with 6 to 8 per cent. of strong sulphuric acid, and then heated in copper boilers to about 180° C., by superheated steam blown through the mass for about two hours; after which hotter steam at about 300° to 350° is blown through, when fatty acids distil, but little or no glycerin passes over unaltered, almost the whole being charred or decomposed, forming acrolein, etc. Here the saponification and destruction of glycerin are largely effected by the sulphuric acid, as well as by the steam itself. Price's process was suggested to the inventors by Tilghman's method, brought out early in 1854, which consisted in making an emulsion of melted fatty matter and water (or solution of alkali) by agitation, and then pumping it through a long coil of iron tubing kept at a temperature near that of melted lead under a pressure of about 2000 lb to the square inch. In this way complete saponification is effected, fatty acids and an aqueous solution of glycerin being obtained when water is used, and soap with more or less water and glycerin when alkaline liquor is employed. It is noticeable that in this process it is not necessary that the alkali should be caustic, as it must be for the ordinary process of soap-boiling; sodium and potassium carbonates answer just as well as their respective hydrates (caustic soda, caustic potash).

*Derivatives.*—Among the numerous derivatives obtainable from glycerin by appropriate chemical reactions, may be more particularly mentioned *nitro-glycerin*, which is, strictly speaking, improperly named, inasmuch as it does not belong to the class of true nitro-substitution derivatives, but is simply constituted like tristearin, the radical of nitric acid displacing the hydrogen of the OH groups. By treating glycerin with nitric acid (preferably by dropping pure glycerin into a mixture of nitric and sulphuric acids) the following reaction ensues, the glycerin becoming what would be systematically termed *trinitrin* or *glycerotrinitrin*:—

$$\begin{Bmatrix} CH_2 . OH \\ CH . OH \\ CH_2 . OH \end{Bmatrix} + 3NO_2OH = 3H_2O + \begin{Bmatrix} CH_2.O.NO_2 \\ CH .O.NO_2 \\ CH_2.O.NO_2 \end{Bmatrix}$$

By treating the resulting "nitro-glycerin" with caustic potash, saponification ensues, potassium nitrate being formed and glycerin reproduced precisely as when tristearin is similarly saponified. Two other important products obtainable from glycerin are *isopropyl iodide* and *allyl iodide*, each of which serves as the starting-point of a large series of chemical products, many of them of utility in the arts. These substances are manufactured by heating glycerin with hydriodic acid, and are formed in virtue of the reactions:—

$$\overset{\text{Glycerin.}}{C_3H_5(OH)_3} + 5HI = 2I_2 + 3H_2O + \overset{\text{Isopropyl iodide.}}{C_3H_7I}$$

$$C_3H_5(OH)_3 + 3HI = I_2 + 3H_2O + \overset{\text{Allyl iodide.}}{C_3H_5I}$$

Again, glycerin is employed in the manufacture of *formic acid*, which is prepared most conveniently by heating together glycerin and oxalic acid. The splitting up of oxalic acid into carbon dioxide and formic acid, which takes place only to a minute extent when oxalic acid is heated alone (owing to the further decomposition of the formic acid), then ensues with but little formation of bye-products, and especially with but little loss of formic acid through further decomposition. This arises from the occurrence of a cycle of changes highly interesting from a chemical point of view, and consisting essentially in the continual formation of a body analogous to monostearin, and its continual breaking up into formic acid, which distils over, and glycerin, which acts over again on a fresh portion of oxalic acid.

*Technical Uses.*—Besides its use as a starting-point in the production of "nitro-glycerin" and other chemical products, glycerin is largely employed for a number of purposes in the arts, its application thereto being due to its peculiar physical properties. Thus its non-liability to freeze (when not absolutely anhydrous, which it practically never is when freely exposed to the air) and its non-volatility at ordinary temperatures, combined with its power of always keeping fluid and not drying up and hardening, render it valuable as a lubricating agent for clockwork, watches, etc., as a substitute for water in wet gasmeters, and as an ingredient in cataplasms, plasters, modelling clay, pasty coloring matters, dyeing materials, moist colors for artists, and numerous other analogous substances which are required to be kept in a permanently soft condition. From its softening property when applied to the skin, it constitutes a chief ingredient in many toilet preparations, creams, and the like. Many of these indeed, sold under fancy names, are nothing but glycerin diluted with water or weak alcohol, or mixed with some oleaginous emulsion or paste, and variously scented. Its solvent power for numerous substances renders it valuable in pharmacy as an ingredient in numerous preparations. In some of these the glycerin acts not merely as a solvent but also as a preservative against decomposition, owing to its antiseptic qualities, which also led to its being employed to preserve untanned leather (especially during transit when exported, the hides being, moreover, kept soft and supple); to make solutions of gelatin, albumen, gum, paste, cements, etc., which will keep without decomposition; to preserve meat and other edibles; to mount anatomical preparations; to preserve vaccine lymph unchanged; and for many similar purposes. Its solvent power is also utilized in the production of various coloring fluids, where the coloring matter would not dissolve in water alone; thus aniline violet, the tinctorial constituents of madder, and various allied coloring matters dissolve in glycerin, forming liquids which remain colored even when diluted with water, the coloring matters being either retained in suspension or dissolved by the glycerin present in the diluted fluid. It has been proposed to use glycerin as a medium for the extraction of the odoriferous principle of flowers, etc., and as a substitute for sugar in the manufacture of some sorts of tobacco, the aroma of which is liable to be deteriorated should fermentation of the saccharine matter set in. Certain kinds of copying inks are greatly improved by the substitution of glycerin, in part or entirely, for the sugar or honey usually added. In fine, the number of useful adaptations of glycerin as an ingredient in order to confer certain special properties is almost unlimited, and its use in these directions is increasing yearly.

*Impurities.*—For some of these purposes it is essential that the glycerin should be of considerable purity. The chief impurities liable to be present vary with the mode of preparation. Substances made by saponification of oils, etc., with oxide of lead or lime, are apt to retain more or less of the metallic compounds, whilst glycerin extracted from soap-leys may also contain mineral matters. Such impure substances are readily

purified by distillation with steam or under greatly diminished pressure. Glycerin prepared by saponifying clarified tallow, etc., by superheated steam, rarely contains fatty acids; if not deprived of practically all the water with which it is mixed in the distillate first obtained, it is less viscid and has a lower density, so that the specific gravity forms a good test as to whether it contains much water or not. Occasionally glycerin is met with intentionally adulterated with sugar-syrup, gum, mineral matters, etc., but such falsifications are comparatively rare. They may be detected by the substance being not wholly soluble in alcohol, by its leaving a residue on ignition in air, by its precipitating a solution of basic lead acetate (after being dissolved in water), or by other special tests, according to the nature of the impurity sought for. Thus, whilst pure glycerin does not reduce alkaline copper solutions so as to precipitate cuprous oxide when boiled therewith, the precipitation is readily produced by certain kinds of sugar, either without any previous treatment (*e. g.*, glucose), or after boiling for a short time with water acidulated with a mineral acid such as sulphuric acid (*e. g.*, cane sugar). (C. R. A. W.)

GMELIN, Johann Georg (1709–1755), a distinguished naturalist, son of the chemist of the same name, was born at Tübingen, June 12, 1709. Having taken his degree in medicine, he in 1727 repaired to St. Petersburg, where in 1731 he was appointed professor of chemistry and natural history. In 1733, by order of the empress Anna, he joined Deslisle, G. F. Müller, and Bchring in an expedition for the exploration of Siberia, which was penetrated as far as the Lena. He returned to St. Petersburg in 1743. In 1749 he was chosen professor of botany and chemistry at Tübingen, where he died, May 20, 1755. Linnæus named a genus of plants *Gmelina* in his honor.

His chief works are *Flora Sibirica* (4 vols., St. Petersburg, 1749–50), and *Reisen Durch Sibirien* (4 vols., St. Petersburg, 1752).

GMELIN, Leopold (1788–1853), a celebrated chemist, was born August 2, 1788, at Göttingen, in the university of which city his father, Johann Friedrich Gmelin, was professor of medicine. He studied medicine and chemistry at Göttingen, Tübingen, and Vienna, and in 1813 commenced lecturing on chemistry at Heidelberg, where in 1814 he was appointed extraordinary and in 1817 ordinary professor of medicine and chemistry; the latter office he held till 1850. He died at Heidelberg, April 13, 1853.

Gmelin's fame rests chiefly on his chemical dictionary, the *Handbuch der Chemie*, the first edition of which, in 2 vols., was published at Frankfort in 1817–19. Tho fourth edition (Heidelberg, 1843, etc.) was written by Gmelin himself as far as the end of vol. v., was continued by Drs. List and Kraut and others, and completed by an eighth volume on physiological chemistry, the work of Professors Lehmann and Rochleder. A revision of the *Handbuch* by Kraut, in two parts, has since appeared. Of the fourth edition an English translation by H. Watts was published by the Cavendish Society in 1848–59. Gmelin was tho author also of *Versuch eines neuen chem. Mineralsystems* (Heidelberg, 1825), and of numerous scientific papers. With Tiedemann he wrote *Versuche über die Wege auf welchem Substanzen aus dem Magen und Darmkanale in das Blut gelangen* (Heidelberg, 1820), and *Die Verdauung* (2 vols., Heidelberg, 1826–27).

GMELIN, Samuel Gottlieb (1743–1774), an eminent naturalist, nephew of J. G. Gmelin (see above), was born at Tübingen, June 23, 1743. He graduated there as M. D. in 1763, went to St. Petersburg in 1767, and in 1768, with Pallas, Güldenstädt, and Lapuchin, commenced a journey for the scientific exploration of the south-east possessions of Russia. Having visited in succession the western districts of the Don, the Persian provinces to the south and south-west of the Caspian Sea, the regions of the Volga, and the eastern borders of the Caspian, he in 1774 was on his way back to St. Petersburg when he was seized as a hostage by Usmey Khan, of the Kaitak tribe, through whose illtreatment he died on July 27th of the same year.

His principal works are *Historia Fucorum iconibus illustrata* (St. Petersburg, 1768), and *Voyages dans differentes parties des l'Empire de Russie* (4 vols. 4to, St. Petersburg, 1770–84).

GMÜND, a town of Würtemberg, circle of Jaxt, formerly a free imperial town, is situated in a charming and fruitful valley on the Rems, here spanned by a beautiful bridge, 31 miles E. N. E. of Stuttgart. It is surrounded by old walls, flanked with towers, and has a considerable number of ancient buildings, among which are the church of the Holy Cross; St. John's church, which dates from the time of the Hohenstaufens; St. Leonard's church, situated on a height near the town, partly hewn out of the rock and much frequented by pilgrims; the chapels of St. Joseph and God's Rest; and the Dominican convent, founded in 1204, now a house of correction. Among the modern buildings are the gymnasium, the drawing and trade schools, the Roman Catholic seminary, the town hall, the royal deaf-mute and blind institute, the blind asylum, the lunatic asylum, and two hospitals. The industries include the manufacture of gold, silver, copper, bronze, and brass wares, silk and part-silk cloths, tobacco, wax, glue, leather, furniture, bone dust, and lucifer matches. There is also considerable trade in corn, hops, and fruit. Population in 1905, 20,566.

Gmünd was surrounded by walls in the beginning of the 12th century by Duke Frederick the elder of Swabia. It received town rights from Frederick Barbarossa, and after the dying out of the Hohenstaufens became a free imperial town. In 1546 it was besieged and taken by the Protestants, and in 1793 i was burned by the Swedes. It retained its independence til 1803, when it came into the possession of Würtemberg. Gmünd is the birth-place of the painter Hans Baldung and of the architect Heinrich Arler. In the Middle Ages the population was about 10,000.

GNAT, a name (Anglo-Saxon, *gnæt*) properly applied to the members of the *Culicidæ* (a family of the insect order *Diptera*, division *Orthorrhapha*, subdivision *Nematocera*, section *Eucephala*, but sometimes also used for the *Chironomidæ*. The *Culicidæ* consists of about 150 known species, of the genera *Culex*, *Anopheles*, *Aedes*, *Psorophora*, *Corethra*, etc.; they are distributed over the chief divisions of the world, and, in spite of their very feeble build, reach as far north as man has penetrated (having been found during Nares's recent Arctic expedition). As regards time, examples of a *Culex* and a *Corethra* have been discovered in the Tertiary beds of the Lower White River, Colorado. The *Culicidæ* are distinguished from their immediate allies, amongst other characters, by having the parts of the mouth produced into a slender porrected rostrum, nearly half the length of the insect, and composed of many distinct pieces (seven, according to Westwood, who remarks that the mouth in these delicate creatures is formed of the same number of pieces, and on the same plan, as that of the robust *Tabani*), and many-jointed palpi, very long and pilose in the male, in which sex the antennæ are plumose and 14-jointed. The fibrils of the antennæ are considered by Mayer as auditory organs. The usual special representative of the family is *Culex pipiens*, the common gnat, whose blood-sucking propensities have rendered it too well known. It pierces the skin with the needle-like lances of its rostrum, which are barbed at the tips, and gradually inserts the whole of those organs, at the same time liquefying the blood by some fluid secretion, which apparently adds to the subsequent irritation. The female, recognizable by her more simple antennæ and palpi, alone attacks man, and, in default of her favorite food, will feed on the honey of flowers. This blood-sucking taste is shared by the allied *Simuliidæ*. The dreaded mosquito is nothing but a species of *Culex*, so closely allied to *C. pipiens* that it is difficult to say where "gnat" ends and "mosquito" begins, though the original mosquito is a native of Cuba. The curious humming noise (from which the name *pipiens* is fancifully derived) accompanying the flight of the gnat is caused by the extremely rapid motion of its wings, which have been calculated to vibrate 3000 times in a minute—the great relative bulk of the thoracic muscles accounting materially for this In connection with the gnat's wing it may be observed that, though apparently clear, "battledore scales" have been discovered upon it by microscopists. The habit of gnats to associate in clouds has been frequently noticed, from the poet Spenser downwards; and instances are even on record of their gatherings round church-spires having caused alarms of fire, from being mistaken for smoke. This apparently arises from the extreme spontaneity and ease of the individuals in their evolutions, which are so rapidly conducted as to enable them to fly unwet in a shower of rain It has been observed that many of these large gatherings are exclusively composed of females. The transformations of the gnat have often been chronicled, and by none in a more interesting way than Réaumur. The female deposits her eggs in a little raft or boat-like mass, upon the surface of water, using her hind-legs while packing them together; the larvæ hatched from them are very active, diving in a jerky manner quickly, and often coming to the surface to breathe, suspending themselves head downwards, and tak-

ing in atmospheric air through a spiracle in one of the large tubes into which the end of the body subdivides. The pupæ are also capable of active motion by means of paddles at the tail, and also suspend themselves under the surface for respiratory purposes, though not breathing as in the larva, but through two little tubes on the back of the thorax. When the perfect insect makes it appearance, the pupa-skin is used by it as a floating foothold until it is ready to take to flight. So short a time is occupied by the entire series of metamorphosis that many generations are perfected in one summer.

GNESEN (Polish, *Gniezno*), the chief town of a circle in the Prussian province of Posen, government of Bromberg, is situated on the Wrzesnia, 30 miles E. N. E. of Posen. Besides the cathedral, which contains the remains of St. Adalbert, there are nine Roman Catholic churches, and there is also a Protestant church, a synagogue, a clerical seminary, and a convent of the Franciscan nuns. The industries are cloth and linen weaving and brandy making. A great horse and cattle market is held annually. The population in 1905 was 23,726, of whom about half are Poles.

Gnesen is said to be the oldest town in Poland, and was the capital of the kingdom till 1320. It was made the seat of an archbishop early in the 11th century. It is still the seat of the cathedral chapter, but the archbishop now resides at Posen.

GNOSTICISM, a general name applied to various forms of speculation in the early history of the church. The term *γνῶσις* is found in the Septuagint translation of the Old Testament, and in the Apocryphal Book of Wisdom, denoting the knowledge of the true God, or knowledge communicated by Him. In the New Testament the word is frequently used by St. Paul (1 Cor. i. 5, xii. 8; 2 Cor. iv. 6, x. 5), and in the second epistle of St. Peter (i. 5, 6; iii. 18), to express the saving knowledge of God in Christ; and in the first epistle to Timothy occurs the significant phrase, "Oppositions of Science (*γνώσεως*) falsely so called." It may be inferred, therefore, that the use of the simple term, in a bad as well as a good sense, was not unknown to the apostolic age, although the expression *γνωστικός* (Gnostic) is said not to be found till the beginning of the 2d century, when it was first employed by the sect of the Ophites, or, according to some, by Carpocrates. Both expressions were used by the early Christian fathers with the double meaning already indicated. Clement of Alexandria, in his *Stromata* or *Miscellanies*, entitles the enlightened or perfect Christian a Gnostic (*Strom.* i. 20, ii. 6). He points out at length the distinction between the true Gnostic and the disciples of false systems who laid claim to the name of Gnostics. It is only to systems of the latter kind that the name of Gnosticism is now applied.

The sources of Gnosticism are to be found in diverse forms of religious and speculative culture antecedent to Christianity, especially in the theology of the Alexandrian Jews, as represented in the writings of Philo, and again in the influences flowing from the old Persian or Zarathustrian religion and the Buddhistic faiths of the East. To the theosophic system of Philo, with its mixture of Platonic and Old Testament ideas, some of the most characteristic conceptions of Gnosticism are certainly to be traced, such as the infinite separation between God and the world, and the necessity of a mediating power or powers in the creation of the world. This class of ideas prevailed largely at the time of the introduction of Christianity, especially in Alexandria, which was the great meeting-point of Jewish and Hellenic culture. The more the state of the pre-Christian Jewish mind and Jewish literature is investigated, the more do we recognize everywhere a strange commingling of old with new thoughts, of tradition with philosophy, of religion with speculation. The age was in all its aspects eclectic, and the Jewish no less than the Gentile schools of the time were centres for the fusion of old streams of culture from many quarters, and the rise of broader intellectual tendencies. Ever since the captivity, Judaism had borne more or less the impress of the old state religion which it encountered in its exile. How far post-Exilian Judaism was moulded by Zarathustrian conceptions is a very difficult question; but no historical student can doubt that its cosmogony, its angelology, and even its anthropology, were largely modified by contact with Persia. But not only was Zarathustrianism active in and through Judaism. In itself, it spread westward, and became directly and indirectly both a precursor and a parent of Gnostic speculation. Certain forms of Gnosticism seem little else than adaptations of the Persian dualism to the solution of the great problem of good and evil. In other forms of it, again, the Pantheism of India seems to have been a pervading influence. This, too, has its representative in the Jewish schools of the time, in the secret doctrines of the Kabbala, which many carry considerably beyond the time of Christ, although the two books through which we alone know these doctrines—the *Book of Creation* and the book called *Zohar* or *Light*—are plainly of much later production. These doctrines sprang up in Palestine, and not among the Hellenistic Jews. The philosophy on which they rest is plainly pantheistic. Whereas the principle lying at the foundation of the theosophy of Philo makes almost an absolute distinction between the Supreme indefinable Source of all things and the world, the philosophic postulate of the Kabbala is the identity of God and the world—the one being the Eternal Substance of which the other is the manifestation and form. "In place of the personal God, distinct from the world, acknowledged in the Old Testament, the Kabbala substitutes the idea of an universal and infinite substance, always active, always thinking, and in the process of thought, developing the universe. In place of a material world distinct from God and created from nothing, the Kabbalist substitutes the idea of two worlds—the one intelligible, the other sensible,—both being, not substances distinct from God, but forms under which the Divine Substance manifests itself" (Mansel's *Gnostic Heresies*, p. 35).

Gnosticism is found reproducing one and all of these conceptions, with the additional idea of *redemption* directly borrowed from Christianity. In all its forms, it may be said to represent the efforts made by the speculative spirit of the time to appropriate Christianity, and to make use o some of its most fertile principles for the solution of the mysteries lying at the root of human speculation. The more advanced writers of the present day refuse to recognize Gnosticism as a *heresy*, or to speak of the Gnostics as deserters from the Christian Church. And they are right so far. The Gnostic schools were always so far outside the church. They were not *heretical*, therefore, in the ordinary sense. But it is no less true that Gnosticism, in all its developments, is only intelligible in connection with Christianity. It was the impulse of Christian ideas which alone originated it, which constituted the vital force of thought that made it one of the most significant phenomena of early Christian history; and it is only its connection with Christianity which can be said to make it any longer interesting.

The question as to the date of its origin has been much investigated of late by such writers as the late Dean Mansel among ourselves, and Lipsius, Harnack, and Hilgenfeld in Germany. Do we find traces of it in the New Testament writings? or are the supposed allusions to it there to be otherwise explained? It is well known that this question has an important bearing upon other questions as to the origin of some of the New Testament writings, and the special object for which these writings were composed. Without entering into details, or attempting to examine the several passages which may be supposed to contain allusions to Gnosticism in the New Testament, it may be said that such allusions, more or less definite, seem to occur in the later epistles of St. Paul, especially the epistles to the Ephesians and Colossians, and in the Pastoral epistles. A supposed allusion has also been traced in the first epistle to the Corinthians, where the word *γνῶσις*, for the first time in the New Testament writings, is found in a depreciatory sense, in the phrase *ἡ γνῶσις φυσιοῖ, ἡ δὲ ἀγάπη οἰκοδομεῖ* (1 Cor. viii. 1). In so very general a use of the expression, however, even in its connection with the question of eating meats which had been offered to idols, it must be held very doubtful whether anything more than a general meaning is intended. And the same remark applies to many even of the more defined modes of expression, such as *Pleroma* and *Æon*, which occur in the later epistles. The true explanation of all these phrases, as well as much else in St. Paul's writings, is probably the fact that the spirit of Gnosticism, and the language which it afterwards developed and applied, were "in the air" of the apostolic age. Its modes of thought, as already seen, were prevalent in Philo and in other quarters, and the tendencies which were afterwards worked up into systems were no doubt in existence in the time of St. Paul, and still more in the later apostolic time. Itseems plainly against such tendencies, rather than against any

special sects or schools, that the cautions of St. Paul are directed. In the Apocalypse, and in the epistles and gospel attributed to St. John, these tendencies are seen in a more developed although hardly in a more distinct state. The second chapter (vv. 6–15) of the Apocalypse has been held to mention a sect of the Gnostics by name—the Nicolaitans—a sect supposed to derive its name from Nicolas, one of the seven deacons, who had departed from the faith and fallen into licentious doctrines and practices. Even in such a sect as this, however, we recognize rather the expression of those lax and restless tendencies which sought everywhere to corrupt the doctrines of the gospel, than any clear philosophical bias. Upon the whole, it may be concluded that what we see in the writings of the New Testament is exactly what we might expect. The Gnostical spirit is present, but Gnosticism is as yet undeveloped. The apostolic age is an age of transition, in which the speculative and ethical spirit of the time is everywhere seen encountering the new life of Christianity, and new seeds of creative thought are everywhere springing from the encounter. There are teachers of all kinds, especially Jewish teachers, busy throughout the Roman world. But Gnosticism properly so-called, as a series of speculative systems, is not yet born. Its approach is heralded by many tendencies forecasting it; but it is only in the Syrian and Alexandrian schools of the beginning of the 2d century that we see it coming forth into distinct shape. Men like Simon Magus and his pupil Menander, the former the opponent of St. Peter, and again men like Cerinthus, the opponent of St. John, may be called Gnostics. In such traditions of their teaching as survive, we see the workings of the Gnostical spirit—the spirit which sought to transmute the facts of Christianity into some ideological theory. But none of these leaders elaborated systems, or at least we are no longer able to trace with precision of outline the doctrines which they taught. Properly speaking, therefore, they are the precursors of Gnosticism, rather than the founders of Gnostic schools. It is implied by Irenæus (i. 25) that the followers of Carpocrates first called themselves Gnostics; and again by Hippolytus that this designation was first assumed by the Ophites (l. v.). But little can be gathered from writers like Irenæus, or even Hippolytus, as to the true order of development of the Gnostic systems. With the former, for example, Saturninus and Basilides stand not only before Carpocrates, but before Cerinthus, the Ebionites, and the Nicolaitans (i. 24, 26). The last thing to seek in the early fathers is either accuracy of chronology, or a clear sequence of thought. They handle topics, for the most part, quite irrespective of either; and the student is forced back mainly, if not exclusively, on internal evidence as his only trustworthy guide in analyzing and classifying the systems of thought which prevailed in the first two centuries.

According to such evidence, and the bias of individual writers, the Gnostic systems have been very differently classified. Mosheim has divided them with reference to their greater or less recognition of the Dualistic principle; Neander with reference to their relation to Judaism; F. Baur with reference to their relation both to Judaism and heathenism. Lipsius, one of the most recent and careful writers on the subject, arranges the Gnostical systems in a threefold order—1st, in so far as they arise within the Jewish schools, and aim to distinguish between Christianity and Judaism; 2d, in so far as they appear within the broader sphere of Hellenism; and 3d, in so far as they approach the circle of Christian faith, and become more or less united with the doctrines of the church.

The most intelligible principle of classification seems to be that already indicated, which recognizes first an inchoate period corresponding to the New Testament age, and represented by many diverse teachers, chiefly of Jewish origin, and then fixes attention upon the great schools of Syria and of Egypt, with the addition of that of Asia Minor, represented by Marcion. These schools are distinguished by their internal features, and their respective relations to Judaism on the one hand and dualism on the other; but they stand out more clearly from their geographical centres, perhaps, than from any other distinguishing features.

I. The inchoate phase of Gnosticism is represented by men like Simon and Cerinthus, both prominently associated with apostles and sects, such as the Ophites or Naasseni (from נָחָשׁ, serpent), the Peratæ or Peratics, the Sethiani, and the followers of one Justinus, author of a book called the *Book of Baruch*, which was written probably not earlier than the beginning of the 2d century. All these sects are elaborately described by Hippolytus in the fifth book of his *Refutation of Heresies*. Simon Magus follows them in his order of treatment (l. v.). There can be little doubt, however, that Simon must be placed in the very front of the history of Gnosticism, in so far as he belongs to this history at all. This is the position that he occupies in the treatise of Irenæus (*Adv. Hæreses*, l. i. c. 23); and his association with St. Peter, as well as the account of him in the apostolic history in which he appears (Acts viii. 5, 9, 10) within seven years of the ascension of our Lord, plainly indicates that this is his true position. The character of his teaching, moreover, points to the same conclusion. It is a form of anti-Christianism, rather than any mere depravation of the Christian system. It is true that he is represented in the passage of the Acts of the Apostles already referred to (viii. 13) as having professed himself a believer, and having been baptized; but his whole career afterwards, and the doctrines attributed to him, prove that, whatever may have been his feelings for the moment, he neither understood Christianity nor came under its practical influence in any degree. Probably he regarded the apostles as only magicians of remarkable skill, and enrolled himself for a time in their company in order that he might learn their secrets and be able to exercise their powers. He was plainly an impostor of the first magnitude, who must be credited with a marvellous and unblushing audacity rather than with any clear philosophic or spiritual aims. He gave himself out as "the great power of God" (Acts viii. 10). "Ego sum sermo Dei," he said of himself, according to St. Jerome (on Matt. xxiv. 5), with much blasphemous nonsense besides. He carried about with him a "certain woman named Helena," a prostitute whom he had purchased in the city of Tyre, and who he said "was the first conception (Ἔννοια) of his mind, the mother of all things, by whom in the beginning he conceived the thought of making the angels and archangels" (Iren., *Adv. Hær.*, i. 23). He recognized Christ as Redeemer, but only as occupying an inferior position to himself. He was the true Logos or Power of God, which had previously in an imperfect degree appeared in Jesus. He himself is "the God who is over all things, and the world was made by his angels" (*Ibid.*, i. 23). It is clear that a teacher of this kind had little relation to Christianity, except in so far as it came across his own designing and ambitious path. He had knowledge and intellectual address to avail himself of the prevailing conceptions of the Alexandrian philosophy, so as to impart some coherency to his own insane dreams; but he was characteristically a magician (as his character has survived in history) rather than a philosopher or spiritual thinker. He claims the position assigned to him in the history of Gnosticism mainly in virtue of his pupil and successor Menander who laid the foundation at Antioch of the Syrian Gnostic school more conspicuously represented by Saturninus and others.

For an account of Cerinthus and his system we refer our readers to the article CERINTHUS. The account of his relations with St. John, as given by later Christian tradition, may be a mythical expression of the popular Christian feeling about an obnoxious teacher rather than a statement of actual facts; but there seems no doubt that Cerinthus represented, in the close of the 1st century, a type of doctrine especially opposed to that of the fourth gospel. He is supposed to have been of Jewish descent, to have been educated in Alexandria, and to have diffused his doctrine in Asia Minor. Opposed as he was to the Christianity of the church in attributing the creation of the world, not to the Supreme God, but to "a power separate and distinct from" Him, and in conceiving Jesus as a mere man to whom the Christ was united at baptism, and from whom the Christ departed before his death (Iren., i. 2; Hippolytus, vii. 33), he was yet far from being the mere anti-Christian impostor that Simon was. He makes no claim to miraculous or divine powers in himself, but holds a distinct, however erroneous, Christology. The idea of redemption is not only recognized by him, but recognized as verified in Christ and in Him alone. His chief conception of the Creator of the world being other than the Supreme God was probably borrowed by him from the Egyptian schools in which he seems to have taught.

The sects of the Naasseni, the Peratæ, the Sethiani, and the followers of Justin, placed, as we have said, by Hippolytus before Simon, may probably all be ranked along with him and Cerinthus in the early and still undeveloped stage

of Gnosticism. It is very difficult to attain to any certainty as to their chronological position. Bunsen traces the origin of the Ophites as far back as the Pauline age; but on very definite grounds it may be concluded that the sect, if existent then, could hardly have acquired any prominence or intellectual interest,—not even in the time of St. John; and certain details of their teaching cannot well be earlier than the beginning of the 2d century. Hippolytus gives a distinct and lengthened account of these several sects. The Naasseni, he says, borrowed their opinions from the Greek philosophers and the teachers of the mysteries; the Peratæ took them "not from the Scriptures, but from the Astrologers;" the Sethiani "patched up their system out of shreds of opinion taken from Musæus, and Linus, and Orpheus;" and Justin was indebted for his to the "marvels of Herodotus!" He says, moreover, of the Naasseni that they "call themselves Gnostics." We must leave here, as elsewhere, the more particular description of these sects to special articles. All of them, however, may, with Mansel (*Gnostic Heresies*, p. 96), be regarded as branches of a common sect to which the title of Ophites particularly answers. The serpent was more or less a common symbol with them all; and the idea of the serpent as in some manner a redeeming power for mankind—"a symbol of intellect by whose means our first parents were raised to the knowledge of the existence of higher beings than their creator"—seems to have run through them all. The serpent no doubt tempted man, but he fell from allegiance to the Demiurge, or Creator of the present world, only to rise to the knowledge of a higher world. Thus to identify the serpent with the Redeeming Word or Divine Son came very near to converting the power of Evil into the ideal of Good. This was the logical conclusion which probably lay more or less in all their systems; but it only showed itself fully in a cognate sect called the Cainites, the description of which follows that of the Ophites and the Sethians in the first book of the treatise of Irenæus (c. xxxi.). This sect carried to its extreme form the inversion of Biblical story, and raised the serpent into a creative and redeeming power. All the evil characters in the Old Testament, with Cain at their head, are set forth as the true spiritual heroes; and, in consistency with the same view, Judas Iscariot, in the New Testament, is represented as alone "knowing the truth," and so accomplishing the betrayal of the Saviour, as some later theorists have also supposed, in order that His good work might be completed. They had a gospel of their own in the interest of such views, which they styled "the gospel of Judas."

Another name in the history of Gnosticism, that of Carpocrates, may be classed in this earlier period, although he is said to have been still active as a teacher in the time of Hadrian (117–138). The followers of Carpocrates, as already mentioned, are represented by Irenæus (i. 25) as first styling themselves Gnostics. His opinions had a certain affinity both with those of Cerinthus and the Ophites. They are described at length by Irenæus (i. 25) and Hippolytus (vii. 20). Both writers also ascribe to this teacher and his disciples a great devotion to magical arts, and accuse them of voluptuousness and even licentiousness of life. They seem to have cherished an esoteric doctrine which inculcated the indifference of all actions, and that nothing was really evil by nature. Some of the teachers of the sect marked their pupils by branding them on the inside of the lobe of the right ear. Epiphanes, a son of Carpocrates, is associated with his father in the reign of Hadrian as actively promoting the spread of their heresy, and, dying young, he is said to have been worshipped as a god by the inhabitants of a town in Cephalonia, of which his mother was a native. He must have been a remarkable youth, credited as he is with a work on *Justice*, fragments of which have been preserved by Clement of Alexandria, advocating a very outrageous form of communism. Women of note allied themselves to this free confederacy, one of whom, Marcellina, came to Rome in the time of Anicetus (d. 168), and "led multitudes astray" (Iren. i. 25; see also CARPOCRATES).

II. But, as already indicated, it is not till the first quarter of the 2d century that we see Gnosticism in full and systematic development; and then it ranges from two main centres—Antioch in Syria, and Alexandria.

(1.) Menander, the pupil of Simon, settled at Antioch, and there laid the foundation of the Syrian Gnostic school, whose chief representatives in the 2d century are Saturninus, Tatian, and Bardesanes, the last two of whom were more or less connected with the church—Tatian, as a pupil of Justin Martyr, and the writer of a harmony of the four gospels under the name of *Diatessaron*, and Bardesanes as one of the first of the interesting series of hymn-writers for which we are indebted to the Syrian church. The Syrian Gnosis is distinguished by its admixture of Zarathustrian elements, and the consequent sharpness and precision with which it seizes the idea of conflict between the powers of Good and Evil—the Supreme God, on the one hand, and the Demiurge and his angels or æons, on the other hand. For a more particular account of the characteristics of the system, see articles on the names above mentioned.

(2.) Along with the Syrian school, and occupying a more prominent place in the development of the religious thought of the 2d century, stands the great school of Alexandrian Gnosticism, represented especially by Basilides and Valentinus and their followers. Basilides appears to have been a native of Syria, and to have taught in Alexandria about the year 125. "He is the first Gnostic teacher," says Bunsen (*Hippolytus and his Age*, p. 107), who has left an individual personal stamp upon his age. . . . His erudition is unquestionable. He had studied Plato deeply. . . . All that was great in the Basilidean system was the originality of thought and moral earnestness of its founder." Bunsen also maintains that "Basilides was a pious Christian, and worshipped with his congregation," while admitting that his sect fell away from the church and from Christianity by refusing to recognize the authority of Scripture and the necessity of practical Christian communion.

Valentinus was probably educated in the school of Alexandrian Gnosticism, as he developed Gnostic ideas in their connection with Hellenic, rather than Persian, modes of thought into the most elaborate and carefully reasoned system which they reached. He came to Rome about the year 140, and there formed a sect which exercised considerable influence over the commingling speculations of the time which met in that great centre. Bunsen vindicates his Christian character, and says that St. Jerome speaks of him with great respect. If at any time he really belonged to the church, it seems to be admitted (Epiph., *Hær.*, xxxi. 7) that in Cyprus, whither he returned and where he died, he ultimately proclaimed himself outside its pale. The most illustrious disciples of the Valentinian Gnosticism, which prevailed on till the 6th century, were Ptolemæus, Heracleon, and Marcus. It is the tenets of these teachers, especially of the first, that are chiefly discussed in the opening chapter of the well-known treatise of Irenæus.

(3.) In addition to these two great schools of Gnosticism there is still a third, especially represented by the famous Marcion of Pontus, whose centre may be regarded as Asia Minor. Marcion was the son of a Christian bishop, by whom he is said to have been excommunicated. Following one Cerdon, a Gnostic of Antioch, Marcion distinguished himself by his extreme opposition to Judaism, and generally by a Gnostic attitude at variance with the Old Testament, the God of which is to him the Demiurge in conflict with the Supreme Being and the Christ whom He sent to redeem the world from the power of this Demiurge. His Christology was of course docetic,—the divine power being only united to the man Jesus for a time. He accepted only ten of St. Paul's epistles, and a mutilated copy of the gospel of St. Luke. The teaching of the Clementine fictions and a Jewish sect known by the name of Elkesaites, whose tenets seem to have resembled this teaching, is considered by Mansel and others to constitute a Judaizing reaction from the Pauline Gnosticism of Marcion.

Our readers are referred to special articles for a detailed exposition of these several Gnostic systems. It remains for us here to give a general sketch of the questions which Gnosticism discussed, and the broader features which characterized its main developments.

III. The fundamental questions with which Gnosticism concerned itself are the same which in all ages have agitated inquiry and baffled speculation, viz., the origin of life and the origin of evil,—how life sprung from the Infinite Source,—how a world so imperfect as this could proceed from a supremely perfect God. The Oriental notion of matter as utterly corrupt is found to pervade all Gnostical systems, and to give so far a common character to their speculations. It may be said to be the ground-principle of Gnosticism.

Setting out from this principle, all the Gnostics agree in regarding this world as not proceeding immediately from the Supreme Being. A vast gulf, on the contrary, is supposed to separate them. In the general mode in which they conceive this gulf to be occupied they also agree, although with considerable varieties of detail.

The Supreme Being is regarded as wholly inconceivable and indescribable—as the unfathomable Abyss (Valentinus) —the Unnamable (Basilides). From this transcendent source existence springs by emanation in a series of spiritual powers (*δυνάμεις*). It is only through these several powers or energies that the infinite passes into life and activity, and becomes capable of representation. To this higher spiritual world is given the name of *πλήρωμα*, and the divine powers composing it, in their ever-expanding procession from the Highest, are called Æons.

So far a common mode of representation characterizes all the Gnostical systems. All unite in this doctrine of a higher emanation-world. It is in the passage from this higher spiritual world to the lower material one that a speculative distinction of an important character begins to characterize them. On the one hand, this passage is apprehended as a mere continued degeneracy from the Source of Life, at length terminating in the kingdom of darkness and death—the bordering chaos surrounding the kingdom of light. On the other hand, this passage is apprehended in a more precisely dualistic form, as a positive invasion of the kingdom of light by a self-existent kingdom of darkness. According as Gnosticism adopted one or other of these modes of explaining the existence of the present world, it fell into the two great divisions which, from their places of origin, have received the respective names of the Alexandrian and Syrian Gnosis. The one, as we have seen, presents more a Western, the other more an Eastern type of speculation. The dualistic element in the one case scarcely appears beneath the Pantheistic, and bears resemblance to the Platonic notion of the *ὕλη*—a mere blank necessity, a limiting void. In the other case, the dualistic element is clear and prominent, corresponding to the Zarathustrian doctrine of an active principle of evil as well as of good—of a kingdom of Ahriman (Auro-Mainyus) as well as a kingdom of Ormuzd (Ahura-Mazdâo).

In the Alexandrian Gnosis a link of subordination is preserved between the two kingdoms, separated as they are. For the *ὕλη* only becomes a living and active power of evil through the quickening impartation of some element from the higher kingdom in its progressive descent from the Supreme Source. The stream of being in its ever-outward flow at length comes in contact with dead matter, which thus receives animation, and becomes a living source of evil. Its life and power, however, are withal only derived from the higher kingdom. But in the Syrian Gnosis the kingdom of darkness has no such dependence upon the kingdom of light. There appears from the first a hostile principle of evil in collision with the good.

Out of this main distinction other more special distinctions arise, still more clearly defining the one form of *γνῶσις* from the other. According as the two kingdoms are recognized as subordinate the one to the other, or as opposed to each other, it is obvious that different views will prevail as to the character of the *Δημιουργός*, or maker of this world, whose name and functions are so prominent in all systems of Gnosticism. In the one case, his relation to the Supreme Source of life will be apprehended as more dependent—in the other, as more hostile. In the former view, the *γνῶσις*, while rising in its pride of speculation far above all mere earthly relations and historical religions, could yet find in these a point of contact, whereby the higher spiritual truth, penetrating this lower world, would gradually raise it to its own elevation. In the latter, no such point of contact is left between nature, or history, and the *γνῶσις*. Accordingly, while the Alexandrian form of Gnosticism was found to embrace Judaism, as a divine institution, although very inferior and defective in its manifestation of the Divine character, the Syrian rejected it as being wholly the work of the spirit of the lower world—the *Δημιουργός* warring with the supreme God. This anti-Judaical spirit is found developed to its extreme in Marcion.

The Gnostic conception of Christ, in so far uniform, is also of course greatly modified by the different relations which the systems thus bore to Judaism. In all he is recognized as a higher Æon, proceeding from the kingdom of light for the redemption of this lower kingdom of darkness. But, in the one case, however superior, he is yet allied to the lower angels and the *Δημιουργός*, governing this lower world. His appearance, accordingly, admits of being historically connected with the previous manifestations of the Divine presence upon earth. But, in the other case, he is apprehended as a being wholly distinct from the *Δημιουργός*, and his appearance takes place in this lower world without any previous preparation, in order that he may draw to himself all kindred spiritual natures held in bondage by the power of this lower world. If any point of connection is admitted in this latter case betwixt Christianity and the lower world, it is certainly not found in Judaism or any historical religion, but in the theosophic schools, where an esoteric knowledge of the Supreme was cultivated.

IV. Vague, confused, and irrational as Gnosticism in most of its systems is, its influence upon the development of Christian thought was by no means detrimental. It compelled Christian teachers to face the great problems of which it attempted the solution in so many fantastic forms It expanded the horizon of controversy within as without the church, and made men like Irenæus, and Clement, and Origen, and even Tertullian, feel that it was by the weapons of reason and not of authority that they must win the triumph of Catholic Christianity. Gnosticism, therefore, may be said to have laid the foundation of Christian science, and it is certainly interesting and deserving of notice that it is in the two great cities of Antioch and Alexandria, —where Gnosticism had chiefly planted itself,—that we see the rise of the first two schools of Christian thought. These centres of half-Pagan and half-Christian speculation became the first centres of rational Christian theology.

The several schools of Gnosticism seem to have gradually lost importance after the middle of the 3d century, although some of them continued to linger till the 6th century. Manichæism was little else than a revival of it in a Syrian form, and this system in the 4th and 5th centuries became so powerful as almost to be a rival to Christianity. The great Christian father St. Augustine, as is well known, was long fascinated by its influence. Again, strangely, in the 12th century the same spirit burst forth afresh, and in special connection with the name of the great apostle of the Gentiles. The sect of Paulicians, originating in the old Syrian haunt of heresy, Samosata, spread through Asia Minor, and then through Bulgaria and the borders of the Greek empire into Italy, Germany, and France. Gibbon, in the 54th chapter of his famous *Decline and Fall of the Roman Empire*, has given a vivid and powerful description of the fortunes and persecutions of the sect, and the readiness with which its doctrines seized upon whole populations. In southern France especially it spread like wildfire, and for a time almost entirely displaced Catholic Christianity. This Western development of the old Oriental dualism was characterized by many of the features of the earlier Gnosticism, such as the doctrine of the radical evil of matter, aversion to the Old Testament as the work of an evil Demiurge, and a docetic Christology. Extinguished in the horrors of the Albigensian war, it can hardly be said to have reappeared in the history of Christendom.

*Literature.*—Only one original Gnostic work has survived to modern times, the *πίστις σοφία* of Valentinus (edited by Petermann, Berlin, 1851); for all further knowledge of the system we are entirely dependent on the treatises of its avowed opponents, —especially on that of Irenæus (*ἔλεγχος τῆς ψευδωνύμου γνώσεως*) and on that of Hippolytus (*ἔλεγχος κατὰ πασῶν αἱρέσεων*), although reference may also be made to passages bearing on the subject in the writings of Justin Martyr, Tertullian, Clemens Alexandrinus, Origen, Eusebius, Philastrius, Epiphanius, Theodoret, Augustine, and Plotinus. The subject is taken up with more or less fulness in all the church histories, and histories of philosophy. Among the more important recent works bearing upon the elucidation of Gnosticism may be mentioned those of Neander (*Genetische Entwickelung der vornehmsten Gnostischen Systeme*, 1818), Matter (*Histoire critique du Gnosticisme*, 1828, 2d. ed. 1843), Baur (*De Gnosticorum Christianismo Ideali*, 1827; *Die Christliche Gnosis*, 1835; *Die drei ersten Jahrhunderte*, 3d. ed., 1863), Bunsen (*Hippolytus u. seine Zeit*, 1852–53), Lipsius (art. "Gnosticismus" in Ersch and Gruber's *Encyclopädie*, republished in a revised form with the title *Der Gnosticismus; sein Wesen, Ursprung, und Entwickelung*, 1860), Harnach (*Zur Quellenkritik der Geschichte des Gnosticismus*, 1873), Mansel (*Gnostic Heresies*, 1875), and Lipsius (*Die Quellen der ältesten Ketzergeschichte neu untersucht*, 1875). References to the monographs by Ritschl, Volkmar, Heinrici, Hilgenfeld, and others on special branches of the subject will be found under the several headings BARDESANES, BASILIDES, MARCION, VALENTINUS, etc. (J. T.)

GNU (*Catoblepas*), a genus of ruminant mammals constituting the equine group of the antelope family, and containing two species—the gnu or kokoon (*Catoblepas gnu*) and the brindled gnu (*Catoblepas gorgon*). Owing to their singular appearance, which has been aptly compared to that of a creature compounded of a bison's head, a horse's body, and an antelope's legs, their proper zoological position has been a matter of dispute—some placing them among the oxen, while others regard them as a connecting link between bovine animals and the true antelopes. The gnu measures about 4½ feet in height at the shoulders, and 9 feet in extreme length. Its nose is broad and flattened, and bears on its upper surface a crest of reversed hair, while there is an abundant growth of bushy black hair beneath the chin and

Gnu.

between the forelegs. The horns, which are present in both sexes, are very broad at their base, forming a solid helmet on the forehead, from which they bend downwards and outwards, thereafter curving rapidly upwards to the tip. A mane of light-colored hair, tipped with brown, and presenting a neatly clipped appearance, extends along the neck, while the horse-like tail, which is more or less of a creamy color, reaches to the ground. The nostrils are large, and are furnished with a muscular valve by which they can be closed. The gnu is a native of the arid plains of South Africa, where it congregates in considerable herds, its restlessness of disposition leading it to migrate frequently from place to place. The fantastic appearance of these creatures is fully equalled by the grotesqueness of their actions. Advancing, as they generally do, in single file, they may be seen wheeling and prancing in all directions, tossing their heads, switching their long tails, and then starting off, especially if alarmed by the appearance of a lion, at tremendous speed, raising columns of dust along their track, and leaving their pursuers hopelessly in the rear. Should they be surprised in their gambols by the sight of a caravan, their exceeding inquisitiveness impels them to approach the intruding object, which they do in a compact square, looking all the while the very picture of defiance. "During bright moonlight," says Captain Harris, "curiosity often prompted a *clump* of gnus to approach within a few yards of our bivouac, where they would stand for hours in the same position, staring wildly, lashing their dark flanks, and uttering a subdued note resembling the harsh croaking of a frog." The noise made by the old bulls, as they roam singly during the rutting season, is much more formidable, being usually compared to the roar of the lion; and many sportsmen who have hunted the gnu bear testimony to the remarkable likeness between the solitary males with their long manes, when seen at a considerable distance, and the "king of beasts." They are by no means the formidable creatures their ferocious aspect might lead one to suppose. However defiant the herd appears as it approaches a caravan, the report of a gun puts the whole troop of gnus to flight, and they are never known to attack man unless driven thereto in self-defence. The female has seldom more than a single young one at a birth, the calf at first being of a whitish color. When captured young, the gnu may, according to Captain Harris, be reared by the hand on cows' milk; and although of uncertain temper, it can be got to herd with the cattle on the farm. The flesh of the calf is considered a delicacy, but that of the adult is insipid, being almost destitute of fat. Its long silky tail is in great request for chowries, and its hide is cut into strips and used for ropes and twine.

The brindled gnu is a more northerly form, never being found south of the Orange river. It is readily distinguished from the other species by the black color of its tail and mane, the obscure vertical streaks on its body, is more elevated withers, and its extremely long aquiline nose. While equally grotesque in appearance and manner, it is much less spirited and active than the gnu. Its flesh is highly prized by the native, who also convert its hide into mantles, rendered attractive to South-African taste by being dressed without removing the long hair of the mane and beard.

GOA, a Portuguese settlement on the Malabar or western coast of India, lying between 15° 44′ 30″ and 14° 53′ 30″ N. lat., and between 73° 45′ and 74° 26′ E. long. It is bounded on the N. by the river Tirakul or Auraundem separating it from Sáwant Wári State, on the E. by the Western Ghâts, on the S. by Kanara district, and on the W. by the Arabian Sea. Total area, 1496 square miles; population, 475,513.

This settlement forms a patch of foreign territory on the east of the Bombay coast, and is surrounded on all sides, except to the seaward, by British districts. Goa is a hilly country, especially the recently acquired portion known as the Novas Conquistas. Its distinguishing feature is the Sahyadri Mountains, which after skirting a considerable portion of the north-eastern and south-eastern boundary, branch off westwards across the territory with numerous spurs and ridges. The plains are well watered by large navigable rivers. The most important is the Mandavi river, on whose banks both the ancient and modern cities of Goa stand, with a fine harbor formed by the promontories of Bardez and Salsette. The port of New Goa or Panjim is divided into two anchorages by the projection of the *cabo* (cape) from the island of Goa, both capable of safely accommodating the largest shipping.

Goa ranks high as regards its early importance among the cities of western India. It emerges very distinctly in the 14th century, and was visited by the famous traveller Ibn Batuta. In the 15th century it formed the chief emporium of trade on the western side of India. Caravans of merchants brought down its products to the coast, and it was the only city in western India which enjoyed at this period a revenue of £10,000. Its wealth and advantageous situation attracted the Mahometan princes of the Deccan, and in 1469 it was taken by the Bâhmani king. A fleet of 120 ships operated from the sea; the Bâhmani troops forced their way down the passes of the Ghâts; and Goa capitulated. It next passed under the Bijápur dynasty, and on the arrival of Albuquerque, at the beginning of the 16th century, its military and commercial capabilities at once struck his mind. In 1510 the fleet of Albuquerque, consisting of 20 sail of the line, with a few small vessels and 1200 fighting men, hove in sight off the harbor. A holy mendicant or *jogi* had lately foretold its conquest by a foreign people from a distant land, and the disheartened citizens rendered up the town to the strangers. Eight leading men presented the keys of the gates to Albuquerque on their knees, together with a large banner which was usually unfurled on state occasions. Mounted on a richly caparisoned steed, Albuquerque entered the city in a triumphal procession, with the Portuguese banners carried by the flower of the Lisbon nobility and clergy amidst the acclamations of an immense multitude, who showered upon the conqueror filigree flowers of silver and gold. Albuquerque behaved well to the inhabitants, but was shortly afterwards expelled by the Bijápur king. However, he returned a few months later with a fleet of 28 ships carrying 1700 men, and after a bloody attack, in which 2000 Mussulmans fell, forced his way into the town. For three days the miserable citizens were subjected to every atrocity. The fifth part of the plunder, reserved for the Portuguese crown, amounted to £20,000.

The conquest of Goa illustrates the essentially military basis on which the Portuguese power in India rested. The subsequent history of the town has been one of luxury, ostentation, and decay. After bearing a siege by the king of Bijápur, and sufferiug from a terrible epidemic, Goa reached the summit of its prosperity at the end of the 16th century, during the very years when the English Company was struggling into existence under Elizabeth. "Goa Dourada," or Golden Goa, seemed a place of fabulous wealth to the plain merchants who were destined to be the founders of British India. "Whoever has seen Goa need not see Lisbon," said a proverb of that day. Indeed, if the accounts of travellers are to be trusted, Goa presented a scene of military, ecclesiastical, and commercial magnificence, such as has had no parallel in the European capitals of India. The brilliant pomp and picturesque display of Goa were due to the fact that it was not only a flourishing harbor, but the centre of a great military and ecclesiastical power. The Portuguese based their dominion in Iudia on conquest by the sword. They labored to consolidate it by a proselytizing organization which throws all other missionary efforts in India into the shade.

Goa reached its climax of pomp and power about the year 1600. Immediately afterwards commenced the long struggle with the Dutch, which before the end of the century had stripped Portugal of its fairest possessions in the East. In 1603 the Dutch blockaded Goa, but had to raise the siege. In 1635 the old epidemic fever which had afflicted Goa in the preceding century again broke out, and raged for five years. In 1639 the Dutch once more blockaded Goa, but found their meagre force of twelve ships insufficient for its capture. In 1666 luxury and the plague and the Dutch privateers had effectually crippled the commerce of Goa. Thevenot in that year drew a powerful picture of the decayed city. In 1675 Dr. John Fryer described the city as in a ruinous state, whilst the inhabitants still made pitiful attempts at display in spite of their increasing misery. In 1683 Goa narrowly escaped falling into the hands of the Marhattá hordes under Sambáji. Before 1687 the abandonment of Old Goa had taken place. "Many streets," says an official document of that year, "have now become lonely and uninhabited." The river had silted opposite its quays, ships could no longer approach the city, the fever had again broken out, and the population had moved out to suburbs nearer the mouth of the river. In 1695 only 20,000 inhabitants remained. In 1739 the whole territory was attacked by the Marhattás, and only saved by the unexpected appearance of a new viceroy with a fleet. Various attempts were made in vain to rebuild Old Goa, and by the middle of the 18th century "this fairest but poorest settlement had become a burden to the Portuguese Home Government, costing no less than 300,000 piastres a year."

In 1759 further attempts to rebuild Old Goa were given up, and the governor changed his residence to Panjim or New Goa, the present city, at the mouth of the river. In 1775 the population was reduced to about 1600 souls, of whom 1198 were Christians, almost entirely half-castes and native converts. In 1759 also the Jesuits were expelled. They had got into their hands what little commerce remained, and the last touch was put to the ruin of Old Goa. "The river washes the remains of a great city,—an arsenal in ruins, palaces in ruins, quay walls in ruins, churches in ruins,—all in ruins. We looked and saw the site of the Inquisition, the bishop's prison, a grand cathedral, great churches, chapels, convents, religious houses, on knolls surrounded by jungle and trees scattered all over the country. We saw the crumbling masonry which once marked the lines of streets and enclosures of palaces, dockyards filled with weeds and obsolete cranes."

Panjim or New Goa lies in lat. 15° 30′ N., long. 75° 53′ E., at the mouth of the river Mandavi, and is a modern town with few pretensions to architectural beauty. Ships of the largest tonnage can lie out in the harbor, but only vessels of moderate size can be brought alongside of the city. The population is estimated at 15,000. Panjim was the residence of the viceroy from 1759, and in 1843 was ranked the capital of the Portuguese possessions in India.

The territory of Goa, including the two cities of Old Goa and Panjim with the adjoining country under Portuguese rule, amounts, as already stated, to 1062 square miles. Of the total population, namely, 392,234, nearly two-thirds or 232,089 are Roman Catholics, 128,824 are Hindus, and 2775 Mahometans. The Roman Catholics are subject in spiritual matters to an archbishop, who has the title of primate of the East. The Hindus and Mahometans enjoy perfect liberty in their religious affairs, and have their own places of worship. Agriculture forms the chief industry of the country. The total area under cultivation is 234,754 acres. Rice is the staple produce; next is the cocoa-nut, which is deemed important from the variety of uses to which the products are applied. The chief exports are cocoa-nuts, betel-nuts, mangoes, water-melons, cinnamon, pepper, salt fish, gum, firewood, and salt; and the chief imports rice, cloth, sugar, wines, tobacco, glassware, and hardware. The district seldom suffers from great floods. Some parts are subjected to inundations during heavy rains, but little damage is done to the crops. The high-lying town of Panjim takes its name from the native word *Ponji*, meaning "arable land that cannot be inundated." The total revenue in 1873–74 was £108,148; the expenditure, £107,145. The police force numbers 919 men. In 1869–70 there were 137 lower schools, and 25 higher schools, including a National Lyceum with 2433 pupils. There are also medical and chemistry schools, and since 1870 a college for the study of practical sciences has been established. The prevailing endemic diseases are intermittent and remittent fevers, diarrhœa, and dysentery. The average annual rainfall for the three years ending 1875 was 100·22 inches.

GOA POWDER, a drug occurring in the form of a yellowish-brown powder, varying considerably in tint, which has recently been brought into notice by Dr. Fayrer of Calcutta as a remedy for ringworm. It derives its name from the Portuguese colony of Goa, where it appears to have been introduced about the year 1852. In 1875 it was shown by Dr. Lima that the substance had been exported from Bahia to Portugal, whence it found its way to the Portuguese colonies in Africa and Asia. The tree which yields it belongs to the genus *Andria* of the natural order *Leguminosæ*, and has been named *A. Araroba*. It is met with in great abundance in certain forests in the province of Bahia, preferring as a rule low and humid spots. The tree is from 80 to 100 feet high, and is furnished with imparipinnate leaves, the leaflets of which are oblong, about 1½ inch long and ¾ inch broad, and somewhat truncate at the apex. The flowers are papilionaceous, of a purple color, and arranged in panicles. The Goa powder or araroba is contained in the trunk, filling crevices in the heartwood. To obtain it, the oldest trees are selected as containing the larger quantity, and after being cut down are sawn transversely into logs, which are then split longitudinally, and the araroba chipped or scraped off with the axe. During this process the workmen feel a bitter taste in the mouth; and great care has to be taken to prevent injury from the irritating action of the powder on the eyes. In this state, *i. e.*, mixed with fragments of wood, the Goa powder is exported in casks.

In India Goa powder has been used in the form of a paste, made by mixing the powder with vinegar or lime juice, as a local application for the cure of Indian ringworm. It appears to be one of the best remedies for that obstinate disease; and so highly is it valued that its price in Bombay averages £3 12s. per lb. Its use in chloasma, intertrigo, and psoriasis, as well as in various other skin diseases, has also been attended with considerable success. The only disadvantages attending its use are—that it leaves a stain which is difficult to remove, and that the powder is apt to set up severe irritation of the eyes, if it come in contact with the conjunctiva. On this account Mr. Balmanno Squire prefers to use it in the form of ointment. When given internally it has been found to act as an emetic and purgative. In England it is now regarded as one of the most efficacious remedies in intractable cases of ringworm.

GOÁLPÁRA, the most westerly district of Assam, between 25° 21′ and 26° 54′ N. lat., and between 89° 44′ and 91° 0′ E. long., bounded on the N. by Bhután, E. by Kámrúp, S. by the Gáro Hills, and W. by Kuch Behar and Rangpur. The district is situated on the Brahmaputra, at the corner where the river takes its southerly course into Bengal. The scenery is striking. Along the banks of the river grow clumps of cane and reed; farther back stretch fields of rice cultivation, broken only by the fruit trees surrounding the villages, and in the background rise the forest-clad hills overtopped by the white peaks of the Himálayas. The soil of the hills is of a red ochreous earth, with blocks of granite and sandstone interspersed; that of the plains is of alluvial formation. Earthquakes are common, and occasionally severe shocks have been experienced. The Brahmaputra annually inundates vast tracts of country. Numerous extensive forests yield valuable timber. Wild animals of all kinds are found.

Goálpára has always formed the frontier between Bengal and Assam; originally it must have constituted part of the legendary Hindu kingdom of Kámrúp; from that it must have fallen into the hands of the early rájás of Kuch Behar, who, however, were

unable long to retain their kingdom. From the east the wild Ahams came down the valley of the Brahmaputra, while from the west the Mughuls extended the limits of the Delhi empire. In 1603 the Mughuls came into collision with the Ahams, but were forced to retreat with a decisive defeat. The district came into British possession with the rest of Bengal in 1765. It has undergone several changes in administration, and in 1872, when Assam was constituted a separate administration, Goálpára was included within it.

In 1891 the population was 452,304,—209,482 being Hindus, and 124,455 Mahometans. Goálpára town, with between 3,000 and 4000 inhabitants, is the most populous place, as well as the chief centre of trade. Dhubri is the point where the traffic of northern Bengal is shipped on board the Assam steamers. Gauripur and Lakhshmipur carry on a thriving trade in timber.

Rice forms the staple crop of the district. Mustard and jute are also largely grown. The area under cultivation is estimated at 600,000 acres, or about one-third of the total area. The district is not liable to any form of natural calamity; occasionally blights have been caused by worms and insects, but the harvests have never been affected. The manufactures consist of the making of brass and iron utensils and of gold and silver ornaments, weaving of silk cloth, basket-work, and pottery. The cultivation of tea has recently been introduced, and is advancing considerably. The chief centres of traffic are Goálpára town, Dhubri, Jogigopha, Bijni, Gauripur, and Singiwári. Local trade is in the hands of Márwári merchants, and is carried on at the *bázárs*, weekly *hâts* or markets, and periodical fairs. The chief exports are mustard-seed, jute, cotton, timber, lac, silk cloth, india-rubber, and tea; the imports, Bengal rice, European piece goods, salt, hardware, oil, and tobacco. The Brahmaputra and its tributaries are the chief means of communication, and are navigated by river steamers and the largest native boats. Goálpára is considered an unhealthy district both for Europeans and for natives. The principal diseases are intermittent and remittent fevers, diarrhœa, dysentery, rheumatism, and chest complaints. Cholera frequently occurs in an epidemic form, and small-pox is more or less prevalent every year. The mean annual temperature is 75° Fahr.; and the average annual rainfall is 98·75 inches.

GOÁLPÁRA, the chief town of above district, situated on the left bank of the Brahmaputra, in 26° 11′ 0″ N. lat., 90° 41′ 0″ E. long. It was the frontier outpost of the Mahometan power in the direction of Assam, and has long been a flourishing seat of river trade. The civil station is built on the summit of a small hill commanding a magnificent view of the valley of the Brahmaputra, bounded on the north by the snowy ranges of the Himálayas and on the south by the Gáro hills. The native town is built on the western slope of the hill, and the lower portion is subject to inundation from the marshy land which extends in every direction. Population 1901, 5,500.

GOAT. All the species of the genus *Capra* may be divided into two classes, the one being represented by the ibex (see IBEX) and the other the goat. The latter class is subdivided into the ægagrus or wild goat (*Capra ægagrus*) and the domestic goat (*Capra hircus*), of which there are many varieties.

The Wild Goat, or Paseng of the Persians (*Capra ægagrus*, Pall.), is an inhabitant of the mountainous regions of Central Asia from the Caucasus to the Himalayas, and is occasionally met with in troops at great elevations. It stands somewhat higher than any of the domesticated varieties of the goat, from which it further differs in its stouter limbs and more slender body. Its neck is short, and is thus fitted to bear the enormous horns, which in the male are larger proportionally than in any other ruminant animal. These measure nearly three feet in length, are obscurely triangular in form, transversely ridged, and are bent backward as in the domestic varieties. The wild goat of the Himalayas, according to Darwin, when it happens to fall accidentally from a height, makes use of its massive horns by bending forward its head and alighting on them, thus breaking the shock. In the female the horns are exceedingly diminutive, or are altogether awanting. The fur, which over the greater part of the body is short, is of a greyish-brown color, with a black line running along the entire length of the back; the short tail and the muzzle are also black, while the under surface of the neck, and the beard, which is present in both sexes, are of a brown color. The paseng is exceedingly wary of the approach of man, and as its agility is no less remarkable there has been little opportunity of studying it closely. The concretions known as *bezoar-stones*, which were formerly much used in medicine and as antidotes of poison, are believed to have been originally obtained from the intestines of this species.

Considerable diversity of opinion has been expressed by naturalists as to the original stock of the domestic goat, which is met with in nearly every quarter of the globe,—the now prevalent and the most probable opinion being that the various domestic breeds are severally descended from wild stock now extinct. Both the ibex and the ægagrus interbreed freely with the common goat, though the produce is not always fertile. Instances of this are not unusual in the Alps and Pyrenees, where goats abound in a semi-domesticated state. Hybrids between the goat and the sheep are also known to have occurred, but are rare.

The following are the chief domestic breeds, possessing distinct characteristics:—the Common Goat, the Maltese, the Syrian, the Angora, the Cashmere, the Nubian or Egyptian, and the Dwarf Goat of Guinea.

*The Common Goat.*—This has many varieties which differ from each other in length of hair, in color, and slightly in the configuration of the horns. The ears are more or less upright, sometimes horizontal, but never actually pendent, as in some Asiatic breeds. The horns are rather flat at the base and not unfrequently corrugated; they rise vertically from the head, curving to the rear, and are more or less laterally inclined. The color varies from a dirty white to a dark-brown, but never black, which indicates Eastern blood. Most of the European countries possess more than one description of the common goat. In the British Isles there are two distinct types, one short and the other long haired. In the former case the hair is thick and close, with frequently an undercoat resembling wool. The horns are large in the male, and of moderate size in the female, flat at the base and inclining outwards. The head is short and tapering, the forehead flat and wide, and the nose small; the legs strong, thick, and well covered with hair. The color varies from white or grey to black, but is frequently fawn, with a dark line down the spine and across the shoulders. The other variety owns a shaggy coat, generally of a reddish-black hue, though sometimes grey or pied and occasionally white. The head is long, heavy, and ugly, the nose coarse and prominent, the horns are situated close together, and often continue parallel almost to the extremities, being also large, corrugated, and pointed. The legs are long, and the sides flat, the animal itself being generally gaunt and thin. This breed is peculiar to Ireland, the Welsh being of a similar description, but more often white. The short-haired goat is the English goat proper. From the constant crossing, however, that takes place between these native breeds and imported foreign specimens, one meets in England with animals possessing very great diversity of form. Both the British breeds and those from abroad are frequently ornamented with two peculiar tassel-like appendages, which hang near together under the throat. It is supposed by many that these ornaments are traceable to some foreign origin; but although there are foreign breeds that possess them, they appear to pertain quite as much to the English native breeds as to those of distant countries, and indeed the peculiarity referred to is mentioned in very old works that describe the goats of the British Islands. The milk produce in the common goat as well as other kinds varies very greatly with individuals. Irish goats often yield a quantity of milk, but the quality is comparatively poor. The goats of France are very similar to those of Britain, varying in length of hair, color, and character of horns. A French writer describes them as possessing "a particularly neat and compact head, small mouth, horns corrugated, and inclining upwards and outwards, a thin neck, narrow chest, and long body, long but muscular legs, and in color white, black, fawn, or pied." The Norway breed is frequently pure white with long hair; it is rather small in size, with small bones, a short rounded body, head small with a prominent forehead, and short, straight, corrugated horns. The facial line is concave. The horns of the male are very large, and curl round after the manner of the wild goat, with a tuft of hair between and in front.

The *Maltese Goat* has its ears long and wide and perfectly pendulous, hanging down below the jaw. The hair is long and cream-colored. Specimens of this kind are usually hornless, which is perhaps the cause of it having been called the "Hornless Variety." It would appear, however, that the absence of these appendages is simply a freak of nature, and not the peculiar characteristic of a particular species.

*The Syrian Goat.*—This breed is met with in various parts of the East, in Lower Egypt, on the shores of the Indian Ocean, and in the island of Madagascar. Both its hair and

ears are excessively long, the latter so much so that they are sometimes clipt to prevent their being torn by stones or thorny shrubs. Its horns are somewhat erect and spiral, with an outward bend.

The *Angora Goat* is often confounded with the Cashmere, but is in reality quite distinct from it. The principal feature of this breed, of which there are two or three varieties, is the length and quantity of its hair, which has a particularly soft and silky texture, covering the whole body and a great part of the legs with close matted ringlets. The horns of the male differ from those of the female, being directed vertically, and in shape spiral, whilst in the female they have a horizontal tendency, somewhat like those of a ram. The face has a sheepish expression. The coat is composed of two kinds of hair, the one short and coarse and of the character of hair, which lies close to the skin, the other long and curly and of the nature of wool, forming the outer covering. Both are used by the manufacturer, but the exterior portion, which makes up by far the greater bulk, is much the more valuable. The process of shearing takes place in early spring, and is conducted with the utmost care; the average amount of wool yielded by each animal is about 2½ lb. The best quality comes from castrated males, the females producing the next best. The annual export of wool from Angora is estimated at about 2,000,000 lb, and its value at £200,000. Large herds are shipped at Constantinople and sent to Cape Colony, where this breed thrives well and is largely propagated, the climate being specially suitable to the perfect development of the wool. A very valuable consignment of these animals arrived in London in May, 1879, for transshipment to the Cape, having been procured from different parts of Asia Minor, by means of great personal exertion, by Mr. J. B. Evans, a South-African goat farmer. The wool or mohair, as it is technically termed, of these goats was remarkably long, fine, and heavy, the average weight of the produce of the herd being reckoned at 6 lb per head. So highly is this breed esteemed by the Turkish farmers that it was with the greatest reluctance they were induced to sell them, and then only at exorbitant prices, some of the males costing £250 and females £150. £50 and £60 are common prices for these goats at Angora. Fig. 1 is from a photograph of the finest male of the flock, the fleece of which was estimated to weigh when shorn full 15 lb. The breed was introduced at the Cape about 1864. In 1878, according to the customs returns, 1,300,585 lb weight of mohair was exported, of the value of £105,313. The Angora is a bad milker and an indifferent mother, but its flesh is better eating than that of any other breed, and in its native country is preferred to mutton. The kids are born very small, but grow fast, and arrive early at maturity. This variety of the goat approaches nearest in its nature, form, and habits to the sheep, even the voice having a strong resemblance.

Fig. 1.—Angora Male Goat.

*The Cashmere Goat.*—This animal has a delicate head, with semi-pendulous ears, which are both long and wide. The hair varies in length, and is coarse and of different colors, according to the individual. The horns are very erect, and sometimes slightly spiral, inclining inwards and to such an extent in some cases as to cross. The coat is composed, as in the Angora, of two materials; but in this breed it is the under coat that partakes of the nature of wool and is valued as an article of commerce. This undergrowth, which is of a uniform greyish-white tint, whatever the color of the hair may be, is beautifully soft and silky, and of a fluffy description resembling down. It makes its appearance in the autumn, and continues to grow until the following spring, when if not removed, it falls off naturally; its collection then commences, occupying from eight to ten days. The animal undergoes during that time a process of combing by which all the wool and a portion of the hair, which of necessity comes with it, is removed. The latter is afterwards carefully separated, when the fleece in a good specimen weighs about half a pound, being worth between half to three quarters of a rupee. It is sold by the "turruk" of 12 lb. This is the material of which the far-famed and costly shawls are made, which at one time had such a demand that, it is stated, "16,000 looms were kept in constant work at Cashmere in their manufacture." Those goats having a short, neat head, very long, thin ears, a delicate skin, small bones, and a long heavy coat, are for this purpose deemed the best. There are several varieties possessing this valuable quality, but those of Cashmere, Thibet, and Mongolia are the most esteemed. About the year 1816 a small herd of Cashmeres was introduced into France with a view to acclimatize and breed them for the sake of their wool, but the enterprise failed. A few were purchased and brought over to England by Mr. C. T. Tower, who, by careful treatment, so far succeeded with them that, in course of time, he had a shawl made from their fleece, which turned out to be of good quality. At the death of the owner some years later, the herd, which had then deteriorated through in-breeding, was presented to the Queen and placed in Windsor Park.

The *Nubian Goat*, which is met with in Nubia, Upper Egypt, and Abyssinia, differs greatly in appearance from all those previously described. The coat is in the female extremely short, almost like that of a race-horse, and the legs are very long. This breed therefore stands considerably higher than the common goat. One of its peculiarities is the strongly convex shape of the face, the forehead being very prominent and the nostrils sunk in, the nose itself extremely small, and the lower lip projecting from the upper. The ears are long, broad, and thin, and hang down by the side of the head like a "double lop" rabbit. The horns are quite black, slightly twisted, and very short, flat at the base, pointed at the tips, and recumbent on the head. But little was known of this breed in Europe—in the West at least—until some ten or twelve years ago, when some were imported into France by the Société d'Acclimatation of Paris, who found its milking qualities to surpass those of all other breeds. Among the goats that are met with in England a good many show unmistakable signs of a more or less remote cross with this breed derived probably from specimens brought from the East on board ships for supply-

Fig. 2.—Nubian Goat.

ing milk during the voyage. It is no doubt on this account that they often go by the name of "Indian" goats.

The *Nepaul Goat* appears to be a variety of the last breed, it having the same arched facial line, pendulous ears, and long legs. The horns, however, are more spiral. The color of the hair, which is longer than in the Nubian, is black, grey, or white, with black blotches.

The *Guinea Goat* is a dwarf species originally from the coast whence its name is derived. There are three varieties Besides the commonest (*Capra recurva*, Linn.), there is a rarer breed (*Capra depressa*, Linn.), inhabiting the Mauritius and the islands of Bourbon and Madagascar. The other variety is met with along the White Nile, in Lower Egypt and at various points on the African coast of the Mediterranean. Some of these dwarf goats may be seen at the Jardin d'Acclimatation in Paris.

*Habits and Management.*—The milch goat has been aptly described as the "poor man's cow"—a designation it well merits, for with a couple of these animals the cottager may at an almost nominal expense enjoy the same advantages in a domestic point of view as the rich man with his "Alderney." Comparatively few are kept in England, because the advantages of goat-keeping are but very imperfectly known, and also on account of the large proportion of land under cultivation. The goat in a state of nature frequents hills and mountainous places, and in a domesticated condition it generally gives preference to elevated situations; but it is a mistake to suppose that it will not thrive on low ground. Being naturally adapted to rocks and dry soils, however, it should not be exposed in marshy places, as this brings on disease of the feet and general ill health; otherwise there is no animal more uniformly hardy. The common varieties will stand heat and cold equally well, but have a decided objection to storms of wind and rain; when they are left to roam loose, therefore, a rough shed should be erected to shelter them from the weather. Under this arrangement a goat may be left out day and night the whole year round; but, if it is kept for the sake of its milk, the yield is greater and it thrives better if housed during winter. Owing to the troublesome propensity of these animals to bark trees and destroy shrubs by nipping off all young and tender shoots, they should not be allowed to roam loose—except on a common—unless proper protection is afforded by wire netting or some such arrangement.

The goat breeds, generally speaking, but once a year. If well housed and under liberal treatment, it will bring forth young twice in twelve months; but this is not advisable. As a rule, at the first birth one kid only is produced, but afterwards two and sometimes three. One has been known for three consecutive years to drop four at a birth; but this is rare and by no means desirable, as the progeny are sure to be small and thrive badly,—the dam in most cases having insufficient milk for so large a family.

The goat propagates at a very early period of its life. The male is generally capable of engendering at seven months; and, in the case just referred to of four at a birth, the father on one occasion was barely six months old. One is sufficient for a hundred females. The latter bring forth at twelve months, and somctimes earlier. For the sake of the future growth and productiveness of the animal, however, it is unwise to permit intercourse between the sexes earlier than at eighteen or at least sixteen months. It is owing to the baneful practice of letting them breed as soon as they will, under the mistaken idea that a more rapid return is obtained, that so many diminutive specimens are met with, both dam and progeny being spoiled in consequence.

The best kind for milch purposes are those with long and deep bodies, not necessarily so broad at the chest as about the haunches, the belly ample and the legs tolerably short; head fine and tapering, with prominent eyes, ears long, thin, wide, and inclining horizontally, horns short and not corrugated, neck thick, and coat close and short. The udder above all must be not only large but soft and elastic, with nice pointed teats. Hornless specimens are often the best milkers.

The goat has 32 teeth, and by these the age up to five years may be pretty accurately ascertained. The lower jaw possesses 12 molars and 8 incisors, and the upper 12 molars alone. The kid at its birth has 6 molars but no incisors; the latter, however, are generally all cut in about three weeks, the first cut molar being visible at three months. At a year or fifteen months old the two front "milk teeth," as the first set of incisors are called, fall, and are replaced by permanent ones; the next two at from two years to thirty months, the third pair from two and a half to three and a half years, and the fourth and last at from three and a half to four and a half years. When all are changed the mouth is said to be "full."

Between two and five years old the she-goat gives the best return in milk, continuing productive often for eight or nine years; its length of life is on an average from ten to fifteen. These animals vary very greatly in the quantity of milk they yield. An ordinary specimen gives from 2 to 3 pints, a superior one 2 quarts, and occasionally first-rate individuals are found supplying 3 quarts a day. The Nubian breed surpasses the common goat in this respect, as the following table from the French work of M. du Plessis will show, in which the yield of a Nubian is compared with that of a half-bred, itself a superior milker.

| *Half-bred Nubian and Native.* | Milk. | Cream. |
|---|---|---|
| 1st day | 3·57 litres. | ·22 litres. |
| 2d " | 3·42 " | ·21 " |
| 3d " | 3·35 " | ·20 " |
| 4th " | 3·62 " | ·23 " |
| 5th " | 3·69 " | ·24 " |
| | 17·65 " | 1·10 " |

| *Pure Nubian Breed.* | Milk. | Cream. |
|---|---|---|
| 1st day | 4·39 litres. | ·3800 litres. |
| 2d " | 4·41 " | ·3848 " |
| 3d " | 4·53 " | ·3850 " |
| 4th " | 4·67 " | ·3969 " |
| 5th " | 4·94 " | ·4030 " |
| | 22·94 " | 1·9497 " |

The litre being as near as possible $1\frac{3}{4}$ pints, the return in English measure is accordingly—from the half-bred 31 pints, or an average per day of 3 quarts, and from the pure Nubian 40 pints, or nearly 4 quarts daily, the richness of the quality being proportionately greater.

Milking should be performed at regular hours, morning and night; but with heavy milkers three times daily is better for the first two or three months, as the oftener the udder is emptied when once full the quicker it is replenished, a sufficient supply of food being of course provided. It is a good plan to accustom the animal to jump on a platform whilst being milked: the teats are thus more easily manipulated, and more command is obtained over the goat and the pail. Feeding and milking should always be carried on at the same time.

Many persons are under the wrong impression that the milk of the she-goat,—which by the way has no strong *hircine* scent attaching to her like the male, another common error,—possesses a flavor peculiar to itself; but this is quite a mistake. Out of dozens kept by the present writer, only one has been found to yield milk differing from that of the cow in taste. The peculiarity in this case seemed natural to the animal, and the milk was decidedly unpalatable.

The flesh of the common goat, although quite eatable, is not to be recommended in comparison with mutton, being rather hard and indigestible. Kid, however, is a great delicacy, and tastes like lamb or veal, according to the manner of dressing. It is preferable cooked like veal, with layers of bacon tied round and stuffed, for with the exception of the suet there is very little fat. A good rich gravy should accompany the joint when served, and there should be no lack of cooking. Hot or cold it is then equally acceptable. Suckling kids are the best eating, as they have then their milk flesh, and are nice and plump. The skins dressed and sewed together make handsome rugs. For food and other remarks on goat-keeping see AGRICULTURE, vol. i. p. 354.

(S. H. P.)

GOATSUCKER, a bird from very ancient times absurdly believed to have the habit implied by the common name it bears in many European tongues besides our own —as testified by the Greek Αἰγοθήλας, the Latin *Caprimulgus*, Italian *Succiacapre*, Spanish *Chotacabras*, French *Tettechèvre*, and German *Ziegenmelker*. The common Goatsucker (*Caprimulgus europæus*, Linn.) is admittedly the type of a very peculiar and distinct Family, *Caprimulgidæ*, a group remarkable for the flat head, enormously wide mouth, large eyes, and soft pencilled plumage of its members, which vary in size from a Lark to a Crow. Its position has been variously assigned by systematists. Though of late years judiciously removed from the *Passeres*, in which Linnæus placed all the species known to him, Professor Huxley considers it to form, with two other Families —the Swifts (*Cypselidæ*) and Humming-birds (*Trochilidæ*), the division *Cypselomorphæ* of his larger group *Ægithognathæ*, which is equivalent in the main to the Linnæan *Passeres*. There are two ways of regarding the *Caprimulgidæ* —one including the genus *Podargus* and its allies, the other recognizing them as a distinct Family, *Podargidæ*. As a matter of convenience we shall here comprehend these last

in the *Caprimulgidæ*, which will then contain two subfamilies, *Caprimulginæ* and *Podarginæ:* for what, according to older authors, constitutes a third, though represented only by *Steatornis*, the singular Oil-bird, or Guacharo, certainly seems to require separation as an independent Family (see GUACHARO).

Some of the differences between the *Caprimulginæ* and *Podarginæ* have been pointed out by Mr. Sclater (*Proc. Zool. Soc.*, 1866, p. 123), and are very obvious. In the former the outer toes have *four* phalanges only, thus presenting a very uncommon character among birds, and the middle claws are pectinated; while in the latter the normal number of five phalanges is found and the claws are smooth, and other distinctions more recondite have also been indicated by him (*tom. cit.*, p. 582). The *Caprimulginæ* may be further divided into those having the gape thickly beset by strong bristles, and those in which there are few such bristles or none—the former containing the genera *Caprimulgus, Antrostomus, Nyctidromus*, and others, and the latter *Podager, Chordiles, Lyncornis*, and a few more.

The common Goatsucker of Europe (*C. europæus*) arrives late in spring from its winter retreat in Africa, and its presence is soon made known to us by its habit of chasing its prey, consisting chiefly of moths and cockchafers, in the evening-twilight. As the season advances the song of the cock, from its singularity, attracts attention amid all rural sounds. This song seems to be always uttered when the bird is at rest, though the contrary has been asserted, and is the continuous repetition of a single burring note, as of a thin lath fixed at one end and in a state of vibration at the other, and loud enough to reach in still weather a

Common Goatsucker.

distance of half-a-mile or more. On the wing, while toying with its mate, or performing its rapid evolutions round the trees where it finds its food, it has the habit of occasionally producing another and equally extraordinary sound, sudden and short, but somewhat resembling that made by swinging a thong in the air, though whether this noise proceeds from its mouth is not ascertained. In general its flight is silent, but at times when disturbed from its repose, its wings may be heard to smite together. The Goatsucker, or, to use perhaps its commoner English name, Nightjar,[1] passes the day in slumber, crouching on the ground or perching on a tree—in the latter case sitting not across the branch but lengthways, with its head lower than its body. In hot weather, however, its song may sometimes be heard by day and even at noontide, but it is then uttered, as it were, drowsily, and without the vigor that characterizes its crepuscular or nocturnal performance. Towards evening the bird becomes active, and it seems to pursue its prey throughout the night uninterruptedly, or only occasionally pausing for a few seconds to alight on a bare spot—a pathway or road—and then resuming its career. It is one of the few birds that absolutely make no nest, but lays its pair of beautifully-marbled eggs on the ground, generally where the herbage is short, and often actually on the soil. So light is it that the act of brooding, even where there is some vegetable growth, produces no visible depression of the grass, moss, or lichens on which the eggs rest, and the finest sand equally fails to exhibit a trace of the parental act. Yet scarcely any bird shows greater local attachment, and the precise site chosen one year is almost certain to be occupied the next. The young, covered when hatched with dark-spotted down, are not easily found, nor are they more easily discovered on becoming fledged, for their plumage almost entirely resembles that of the adults, being a mixture of reddish-brown, grey, and black, blended and mottled in a manner that passes description. They soon attain their full size and power of flight, and then take to the same manner of life as their parents. In autumn all leave their summer haunts for the south, but the exact time of their departure has hardly been ascertained. The habits of the Nightjar, as thus described, seem to be more or less essentially those of the whole Subfamily—the differences observable being apparently less than are found in other groups of birds of similar extent.

A second species of Goatsucker (*C. ruficollis*), which is somewhat larger, and has the neck distinctly marked with rufous, is a summer visitant to the south-western parts of Europe, and especially to Spain and Portugal. The occurrence of a single example of this bird at Killingworth, near Newcastle-on-Tyne, in October, 1856, has been recorded by Mr. Hancock (*Ibis*, 1862, p. 39); but the season of its appearance argues the probability of its being but a casual straggler from its proper home. Many other species of *Caprimulgus* inhabit Africa, Asia, and their islands, while one (*C. macrurus*) is found in Australia. Very nearly allied to this genus is *Antrostomus*, an American group containing many species, of which the Chuck-will's widow (*A. carolinensis*) and the Whip-poor-will (*A. vociferus*) of the eastern United States (the latter also reaching Canada) are familiar examples. Both these birds take their common name from the cry they utter, and their habits seem to be almost identical with those of the Old-World Goatsuckers. Passing over some other forms which need not here be mentioned, the genus *Nyctidromus*, though consisting of only one species (*C. albicollis*) which inhabits Central and part of South America, requires remark, since it has tarsi of sufficient length to enable it to run swiftly on the ground, while the legs of most birds of the Family are so short that they can make but a shuffling progress. *Heleothreptes*, with the unique form of wing possessed by the male, needs mention. Notice must also be taken of two African species, referred by some ornithologists to as many genera (*Macrodipteryx* and *Cosmetornis*), though probably one genus would suffice for both. The males of each of them are characterized by the wonderful development of the ninth primary in either wing, which reaches in fully adult specimens the extraordinary length of 17 inches or more. The former of these birds, the *C. macrodipterus* of Afzelius, is considered to belong to the west coast of Africa, and the shaft of the elongated remiges is bare for the greater part of its length, retaining the web, in a spatulate form, only near the tip. The latter, to which the specific name of *vexillarius* was given by Mr. Gould, has been found on the east coast of that continent, and is reported to have occurred in Madagascar and Socotra. In this the remigial streamers do not lose their barbs, and as a few of the next quills are also to some extent elongated, the bird, when flying, is said to look as though it had four wings. Specimens of both are rare in collections, and no traveller seems to have had the opportunity of studying the habits of either so as to suggest a reason for this marvellous sexual development.

The second group of *Caprimulginæ*, those which are but poorly or not at all furnished with rictal bristles, contains about five genera, of which there is here only room to particularize *Lyncornis* of the Old World and *Chordiles* of the New. The species of the former are remarkable for the tuft of feathers which springs from each side of the head, above and behind the ears, so as to give the bird an appearance like some of the "Horned" Owls—those of the genus *Scops*, for example; and remarkable as it is to find certain forms of two Families, so distinct as are the *Strigidæ* and the *Caprimulgidæ*, resembling each other in this singular external feature, it is yet more remarkable to note that in some groups of the latter, as in some of the former, a very curious kind of dimorphism takes place. In either case this has been frequently asserted to be sexual, but on that point doubt may fairly be entertained. Certain it is that in some

[1] Other English names of the bird are Evejar, Fern-Owl, Churn-Owl, and Wheel-bird—the last from the bird's song resembling the noise made by a spinning-wheel in motion.

groups of Goatsuckers, as in some groups of Owls, individuals of the same species are found in plumage of two entirely different hues—rufous and grey. The only explanation as yet offered of this fact is that the difference is sexual, but, as just hinted, evidence to that effect is conflicting. It must not, however, be supposed that this common feature, any more than that of the existence of tufted forms in each group, indicates any close relationship between them. The resemblances may be due to the same causes, concerning which future observers may possibly enlighten us, but at present we must regard them as analogies not homologies. The species of *Lyncornis* inhabit the Malay Archipelago, one, however, occurring also in China. Of *Chordiles* the best known species is the Night-hawk of North America (*C. virginianus* or *C. popetue*), which has a wide range from Canada to Brazil. Others are found in the Antilles and in South America. The general habits of all these birds agree with those of the typical Goatsuckers.

We have next to consider the birds forming the genus *Podargus* and those allied to it, whether they be regarded as a distinct Family, or as a Subfamily of *Caprimulgidæ*. As above stated, they have feet constructed as those of birds normally are, and their sternum seems to present the constant though comparatively trivial difference of having its posterior margin elongated into two pairs of processes, while only one pair is found in the true Goatsuckers. *Podargus* includes the bird (*P. cuvieri*) known from its cry as More-pork to Tasmanian colonists,[1] and several other species, the number of which is doubtful, from Australia and New Guinea. They have comparatively powerful bills, and it would seem feed to some extent on fruits and berries, though they mainly subsist on insects, chiefly *Cicadæ* and *Phasmidæ*. They also differ from the true Goatsuckers in having the outer toes partially reversible, and they are said to build a flat nest on the horizontal branch of a tree for the reception of their eggs, which are of a spotless white. Apparently allied to *Podargus*, but differing among other respects in its mode of nidification, is *Ægotheles*, which belongs also to the Australian Subregion; and further to the northward, extending throughout the Malay Archipelago and into India, comes *Batrachostomus*, wherein we again meet with species having aural tufts somewhat like *Lyncornis*. The *Podarginæ* are thought by some to be represented in the New World by the genus *Nyctibius*, of which several species occur from the Antilles and Central America to Brazil. Finally, it may be stated that none of the *Caprimulgidæ* seem to occur in Polynesia or in New Zealand, though there is scarcely any other part of the world suited to their habits in which members of the Family are not found. (A. N.)

GOBELIN, the name of a family of dyers, who in all probability came originally from Rheims, and who in the 15th century established themselves in the Faubourg Saint Marcel, Paris, on the banks of the Bièvre. The first head of the firm was named Jehan, and died in 1476. He discovered a peculiar kind of scarlet dye, and he expended so much money on his establishment that it was named by the common people *la folie Gobelin*. To the dye works there was added in the 16th century a manufactory of tapestry. So rapidly did the wealth of the family increase, that in the third or fourth generation some of them forsook their trade and purchased titles of nobility. More than one of their number held offices of state, among others Balthasar, who became successively treasurer general of artillery, treasurer extraordinary of war, councillor secretary of the king, chancellor of the exchequer, councillor of state, and president of the chamber of accounts, and who in 1601 received from Henry II. the lands and lordship of Briecomte-Robert. He died in 1603. The name of the Gobelins as dyers cannot be found later than the end of the 17th century. In 1662 the works in the Faubourg Saint Marcel, with the adjoining grounds, were purchased by Colbert on behalf of Louis XIV., and transformed into a general upholstery manufactory, in which designs both in tapestry and in all kinds of furniture were executed under the superintendence of the royal painter Lebrun. On account of the pecuniary embarrassments of Louis XIV., the establishment was closed in 1694, but it was reopened in 1697 for the manufacture of tapestry, chiefly for royal use and for presentation. During the Revolution and the reign of Napoleon the manufacture was suspended, but it was revived by the Bourbons, and in 1826 the manufacture of carpets was added to that of tapestry. In 1871 the building was partly burned by the Communists.

[1] In New Zealand, however, this name is given to an Owl (*Scelogylaux novæ-zelandiæ*)

See Lacordaire, *Notice historique sur les manufactures impériales de tapisserie des Gobelin et de tapis de la Savonnerie, précédée du catalogue des tapisseries qui y sont exposées*, Paris, 1853; and also the article TAPESTRY.

GOBI is the name usually applied by European geographers to a vast stretch of desert in Central Asia, which has its western limits in the neighborhood of 75° E. long., and its eastern somewhere between 114° and 115°. Like many other geographical designations, the word is not only of doubtful origin, but in conventional usage has modified its meaning. According to Sir T. Douglas Forsyth, it is originally the Turki for "great;" and Richthofen informs us that by the Chinese it is employed, not as a proper name, but, like Shamo, as a general term for any sandy and desert piece of country. This being the case, the great German geographer proposes to displace the word Gobi in European usage by the Chinese Han-hai or Dry Sea, suggestive as he says not only of the present appearance but also of the former history of the region; but it is to be feared that the older designation has become too familiar, and the disadvantages arising from its use are of too recondite a character, to render it likely that his proposal will be generally accepted.

As a sea the Gobi or Han-hai must have been comparable in extent to the Mediterranean, and the ancient coast-line can be pretty clearly recognized. In its present state it may be divided into two distinct basins, the western taking its name from the river Tarim or Tarym, and the eastern from the Chinese Shamo or "Sand Desert." The Dzungarian valley stretches westwards like a gulf. The Tarim basin is bounded on the S. by the range of mountains which, under various names applicable to different portions, such as the Kwen-lun and the Altyntag, forms the northward rim of the great plateau of Thibet; on the west it comes up to the spurs of the Pamir plateau, and on the north it lies along the foot of the Thian Shan. If we measure from the source of any of its principal tributaries, the Tarim must have a course of more than 1000 miles. The head-waters rise in the mountains just named, and the more important of them in the south and west. The Khotan river and its confluent the Kara-Kash both descend from the Karakorum mountains, and flow in a generally northward direction; the Zarafshan or Yarkand River, rising in the same range, winds about in the first part of its course so as to enter the Gobi almost from the west; and the Kizil Su or Kashgar River has its numerous head streams in the Kizil Yart mountains belonging to the Pamir plateau. The Aksai River and the Shah Yar are the most important contributions from the Thian Shan. The course of all of these rivers after they enter the Gobi is largely matter of conjecture, and all that can be asserted with confidence is that they unite to form the Tarim, and find their final goal in an inland lake. They have probably all reached a common channel about 82° E. long.; but as the stream presses eastward it again breaks up into numerous branches, the arrangement of which, except along the route followed by Przhevalski, is still unknown. As it passes east the stream gradually loses in volume by absorption, evaporation, and the demands of riparian populations. In the neighborhood of the Ugendarya, the breadth is about 300 or 360 feet, and the depth about 20. The course of the Tarim lies much nearer the northern side of the Gobi than the southern, but it gradually trends south-east, and at length passing through Lake Karaburan, loses itself in Lake Chon-Kul (*i. e.*, great lake) or Kara-Kurchin. This last lake is identified with the famous Lob-nor, the position of which has been one of the outstanding problems of comparative geography. Against the identification a number of objections have been urged by Richthofen (*cf.* "Bemerkungen zu den Ergebnissen von Ober-lieut. Prejewalski's Reise" in *Zeitsch. für Erdk.*, Berlin, 1878), the most important of which are the prevailing tradition that the Lob-nor was a salt lake while the Chon-Kul is fresh, and the fact that the Chinese maps place the Lob-nor to the north of the position assigned to the Chon-Kul, which according to Przhevalski lies about 39° 30′ N. lat., immediately to the N. of the Altyntag range (13,000 to 14,000 feet high). The country through which the Lower Tarim flows is dreary and monotonous. "In general," reports the traveller, "the Lob-nor desert is the wildest and most unfertile of all that I have yet seen in Asia; it is sadder than the desert of Ala-Shan."

A meagre vegetation of tamarisks and reeds lines the course of the river. Away towards the south-west there stretch, if we may trust to native reports, those vast fields of drifting and treacherous sands which have given so much of its terror to the legendary account of the desert of Gobi. That the reports are in the main true, and that the legends are founded on fact, appears to be rendered probable by the statements of Sir T. Douglas Forsyth, who has contributed an interesting paper on the subject to the *Proceedings of the Royal Geographical Society* (1876). The population of the Tarim basin is scanty and poverty-stricken. On the Lower Tarim there are nine villages with a total of 1200 souls. Cattle rearing is more general than agriculture, which indeed is of the most recent introduction, and confines itself to barley and wheat. Mahometanism is the universal religion, and the language appears to be identical with the Taranchi and the Sart.

The Shamo or eastern basin is quite different in its character. Here we have no large river like the Tarim, and, instead of its boundaries being marked by lofty ranges of mountains from 13,000 to 20,000 feet high, the ground gradually rises in a series of scarcely marked terraces. The central point, at Ozon Khoshu, is the lowest discovered in Central Asia, being only 607 metres (1948 feet) above the level of the sea. "The aspect of the country," says Ney Elias, "who crossed in a north-westerly direction from China, is that of low hills or downs, with valleys and plains intervening, the whole of a rocky or stony nature rather than sandy, though patches of sand do occur every here and there. What little vegetation exists is chiefly composed of weeds, 'scrub,' and heath, there being scarcely any grass, and only a dwarfed and stunted tree here and there, in the gorges or passes of those low rocky ranges that at uncertain intervals cross the desert in almost parallel lines from east to west." Of the western portion of the basin we have no modern account.

Marco Polo was the first European who gave a distinct description of the desert of Gobi. He tells us how on quitting Charchan (the modern Chachan, according to Yule) "you ride some five days through the sands finding none but bad and bitter water; and then you come to a city called Lop at the edge of the desert. . . . The length of the desert is so great that it would take a year and more to ride from one end of it to the other. It is all composed of hills and valleys of sand." And then he goes on to speak of spirits that haunt the waste, and syllable men's names, and of strange noises like the tramp and hum of a great cavalcade, of the sound of drums, and a variety of musical instruments. Polo appears to have proceeded east from Khotan to Lob, and then further east to Etsina on the southern edge of the desert, and afterwards to have spent forty days in crossing the desert northwards to Karakorum.[1]

Later notices of the Gobi, especially of its eastern portions, are given by Gerbillon, 1688–98 (in Duhalde's appendix), by the Dutchman Evert Ysbrand Ides (1692–94), and by Lorenz Lange, who was sent in 1727–28 and in 1736 by Peter the Great to Peking.[2] But it was not till the present century that accurate information began to accumulate about the eastern portions, and the traveller who has lifted the veil from the western portions is still engaged in his explorations. In 1830–31 Fuss and Bunge crossed the eastern Gobi from Urga to Kalgan; and Dr. Fritsche executed a series of journeys in the same district between 1869 and 1873.[3] The missions of the Russian officials Andre Gustavitch Prinz (1863) and Shishmaroff (1868) added little to the knowledge of the region; but in 1870 Pavlinoff, consul at Chuguchak, being accompanied by a Government topographer Matusovski, made valuable observations on the route from Suok to Kobdo, and from Kobdo to Uliassutai.[4] Of still greater moment were the travels of Ney Elias in 1872–73, and of Przhevalski between 1870 and 1877. In his earlier journey (1870–72) Przhevalski travelled across the Gobi in a line almost due south from Urga, and in 1877 he struck south-east from the Yulduz range, one of the outrunners of the Thian Shan.

Besides the works referred to in the text see especially Richthofen's masterly account of the Gobi in his *China*, vol. i., Berlin, 1877, and Prejevalsky, *Mongolia, the Tangut Country*, etc., London, 1876, and *From Kulja across the Tian-Shan to Lob Nor*, London, 1879. An account of Elias's journey will be found in *Journal of the Royal Geographical Society*, 1873, and in Guido Cora's *Cosmos*, 1874.

Fig. 1.—*Gobius lentiginosus.*

GOBY. The Gobies (*Gobius*) are small fishes readily recognized by their ventrals (the fins on the lower surface of the chest) being united into one fin, forming a suctorial disk, by which these fishes are enabled to attach themselves in every possible position to a rock or other firm substances. They are essentially coast-fishes, inhabiting nearly all seas, but disappearing towards the Arctic and Antarctic Oceans. Many enter, or live exclusively in, such fresh waters as are at no great distance from the sea. Between 200 and 300 different kinds are known.

Fig. 2.—United ventrals of Goby.

GOD. See Theism.

GODALMING, a municipal borough and market-town of England, county of Surrey, is situated 32 miles S. W. of London, in a valley on the right bank of the Wey, which is navigable thence to the Thames. It consists principally of one street nearly a mile in length, on the high road between London and Portsmouth. The chief public buildings are the town-hall and market-house, Wyat's almshouses for poor men, the public hall, and the parish church, an old cruciform building, of mixed architecture, but principally Early English and Perpendicular. The church was repaired in 1840, and also in 1867. It contains a large number of old memorials. Godalming has manufactures of paper, leather, parchment, and hosiery, and some trade in corn, malt, bark, hoops, and timber. The town obtained a market from Edward I. in 1300, and was incorporated in 1575. The population in 1901 was 8748.

GODÁVARI, a river of Central India, which flows across the Deccan from the western to the Eastern Ghâts, for sanctity, picturesque scenery, and utility, surpassed only by the Ganges and the Indus. The total length is 898 miles; the estimated area of drainage basin, 112,200 square miles. Its traditional source is on the side of a hill behind the village of Trimback in Nasik district, Bombay, but according to popular legend it proceeds from the same ultimate source as the Ganges, though underground. Its course is generally south-easterly. After passing through Nasik district, it crosses into the dominions of the nizám of Hyderabad. When it again strikes British territory it is joined by the Pranhita, with its tributaries the Waraha, the Penganga, and Wainganga. For some distance it flows between the Nizám's dominions and the upper Godávari district, and receives the Indravati, the Sal, and the Sabári. The stream is now very imposing, with a channel varying from 1 to 2 miles in breadth, occasionally broken by alluvial islands. Parallel to the river stretch long ranges of hills; on the opposite side the country is more open and cultivated. Below the junction of the Sabári the scenery is such that the Godávari has got the name of the Indian Rhine. The channel here begins to contract. The flanking hills gradually close in on both sides, and the result is a magnificent gorge only 200 yards wide through which the water flows into the plain of the delta, about 60 miles from the sea. The head of the delta is at the village of Dhaulaishvaram, where the main stream is crossed by the irrigation anicut. The river has seven mouths, the largest being the Gautami Godávari. The Godávari is regarded as peculiarly sacred, and once every twelve years the great bathing festival called *Pushkaram* is held on its banks.

The upper waters of the Godávari are scarcely utilized for irrigation, but the entire delta has been turned into a garden of perennial crops by means of the anicut at Dhaulaishvaram, from which three main canals are drawn off. The river channel here is 3½ miles wide. The anicut is a substantial mass of stone, bedded in lime, cement, about 2½ miles long, 130 feet broad at the base, and 12 feet high

The stream is thus pent back so as to supply a volume of 3000 cubic feet of water per second during its low season, and 12,000 cubic feet at time of flood. The canals have a total length of 528 miles, capable of irrigating 780,000 acres, while 463 miles are also used for navigation. In 1864 water-communication was opened between the river systems of the Godávari and Kistna. Rocky barriers and rapids obstruct navigation in the upper portion of the Godávari. Attempts have been made to construct canals round these barriers but with little success, and lately the undertaking has been entirely abandoned.

GODÁVARI, a district of Madras presidency, British India, lying between 16° 15′ and 17° 35′ N. lat., and between 80° 55′ and 82° 38′ E. long.; and bounded N. by the Central Provinces and Vizagapatam district, E. by Vizagapatam and the Bay of Bengal, S. by the Bay of Bengal and Kistna district, and W. by the Nizám's dominions. The district is divided by the Godávari river into two nearly equal parts. The scenery along the course of the river is varied and striking. The only lake of importance is the Koléru, which is studded with islands and fishing villages. Building stone and limestone are abundant in the uplands. Iron is also found. The jungle products are myrobalans, soap-nuts, tamarinds, bamboo-rice, honey, and beeswax. Wild animals and game birds are numerous.

The population in 1871 numbered 1,592,939 (803,603 males, 789,336 females), showing a considerable increase on former years. The Hindus numbered 1,555,981, the Mahometans 35,173, the Christians 1483 (Protestants and Roman Catholics in nearly equal numbers), 39 were Buddhists, and 263 not separately classified. Nineteen towns each contain upwards of 5000 inhabitants,—the aggregate population of the three chief towns, Ellor, Rájahmandri, and Cocanada, being 63,064.

The total area of the district is 7345 square miles, of which 2713 square miles belong to Government. Of Government land, 386,400 acres are under cultivation; the rest either belongs to the *zamíndárí* estates, or is waste and uncultivable. The chief products are rice, gram, jute, hemp, gingelly, tobacco, sugar-cane, and indigo; rice and food grains have improved in quality owing to the extension of irrigation by canals. Government tenants have permanent rignt of occupancy so long as they pay the Government demand, while on the *zamíndárí* estates cultivators are merely yearly tenants. The district is well supplied with means of communication by 491 miles of good road and 431 miles of canals. The principal manufactures are cotton and woollen carpets, sheep wool blankets, uppada cloths, sugar, and indigo. The chief articles of trade are grain, cotton, jaggery, turmeric, cocoa-nut, flax-cloth, onions, garlic, lace cloths, tobacco, gingelly seed, lamp oil, salt, tamarinds, cattle, teak-wood, skins, opium, and indigo. Cocanada, Ellor, Rájahmandri, Mandapetta, Jaggampetta, Husanbada, Nasapur, Palakollu, Dowlaishvaram, Ambajipetta, and Jagannathpur are the most important seats of commerce. The estimated value of imports in 1874–75 was £204,238, and of exports, £903,253. The total revenue in 1875–76 was £558,812; the expenditure, £28,604; the total municipal income, £5152. There are 28 magisterial and 15 revenue and civil courts. There are 387 schools, attended by 7759 pupils. The administrative headquarters is at Cocanada. The prevailing epidemic diseases are *beri-beri* and fevers; cholera and small-pox occur during the hot season, but only the poorer classes are attacked. Cattle diseases also prevail. The average annual rainfall from 1871 to 1875 was 43·35 inches; the average mean temperature at Rájahmandri in 1876 was 82·7° Fahr. Two severe storms, which caused great destruction to property, occurred in 1832 and 1839.

The Godávari district formed part of the Andhra division of Dravida, the north-west portion being subject to the Orissa kings, and the south-western belonging to the Vengi kingdom. For centuries it was the battlefield on which various chiefs fought for independence with varying success till the beginning of the 16th century, when the whole country may be said to have passed under Mahometan power. At the conclusion of the struggle with the French in the Carnatic, Godávari with the Circars was ceded to the English by the nawáb, and finally confirmed by the imperial *sanad* in 1765. The present district was constituted in 1859, by the redistribution of the territory comprising the former districts of Guntoor, Rájahmandri, and Masulipatam, into what are now the Kistna and Godávari districts. Population in 1891, 2,078,782.

GODFREY OF BOUILLON. See BOUILLON.

GODOLPHIN, SIDNEY GODOLPHIN, EARL OF (c. 1635–1712), was a cadet of an ancient family of Cornwall, and was born most probably in 1635. At the Restoration he was introduced into the royal household by Charles II., with whom he had previously become a favorite, and he also at the same period entered the House of Commons as member for Helstone. Although he very seldom addressed the House, and when he did so, only in the briefest manner he gradually acquired a reputation as its chief if not its only financial authority. In March, 1679, he was appointed a member of the privy council, and in the September following he was promoted, along with Viscount Hyde (afterwards earl of Rochester) and the earl of Sunderland, to the chief management of affairs. Though he voted for the Exclusion Bill in 1680, he was continued in office after the dismissal of Sunderland, and in September, 1684, he was created Baron Godolphin of Rialton, and succeeded Rochester as first lord of the treasury. After the accession of James II. he was made chamberlain to the queen, and, along with Rochester and Sunderland, enjoyed the king's special confidence. In 1687 he was named commissioner of the treasury. He was one of the council of five appointed by King James to represent him in London, when he went to join the army after the landing of William prince of Orange in England, and, along with Halifax and Nottingham, he was afterwards appointed a commissioner to treat with the prince. On the accession of William, though he only obtained the third seat at the treasury board, he had virtually the chief control of affairs. He retired in March, 1690, but was recalled on the November following, and appointed first lord. While holding this office he for several years continued, in conjunction with Marlborough, a treacherous intercourse with James II., and is said even to have anticipated Marlborough in disclosing to James intelligence regarding the intended expedition against Brest. After Fenwick's confession in 1696 regarding the Assassination Plot, Godolphin, who was compromised, was induced to tender his resignation; but when the Tories came into power in 1700, he was again appointed lord treasurer, and retained office for about a year. Though not a favorite with Queen Anne, he was, after her accession, appointed to his old office, on the strong recommendation of Marlborough. He also in 1704 received the honor of knighthood, and in December, 1706, he was created Viscount Rialton and Earl of Godolphin. The influence of the Marlboroughs with the queen was, however, gradually supplanted by that of Mrs. Masham and Harley earl of Oxford, and with the fortunes of the Marlboroughs those of Godolphin were indissolubly united. The services of both were so appreciated by the nation that they were able for a time to regard the loss of the queen's favor with indifference, and even in 1708 to procure the expulsion of Harley from office; but after the Tory reaction which followed the impeachment of Dr. Sacheverel, the queen made use of the opportunity to take the initiatory step towards delivering herself from the irksome thralldom of Marlborough by abruptly dismissing Godolphin from office, 7th August, 1710. He died 15th September, 1712.

Godolphin owed his rise to power and his continuance in it under four sovereigns chiefly to his exceptional mastery of financial matters; for if latterly he was in some degree indebted for his promotion to the support of Marlborough, he received that support mainly because Marlborough recognized that for the prosecution of England's foreign wars his financial abilities were an indispensable necessity. He was cool, reserved, and cautious, but his prudence was less associated with high sagacity than traceable to the weakness of his personal antipathies and prejudices, and his freedom from political predilections. Perhaps it was his unlikeness to Marlborough in that moral characteristic which so tainted Marlborough's greatness that rendered possible between them a friendship so intimate and undisturbed: he was, it would appear, exceptionally devoid of the passion of avarice; and so little advantage did he take of his opportunities of aggrandizement that, though his style of living was unostentatious,—and in connection with his favorite pastimes of horse-racing, card-playing, and cockfighting he gained perhaps more than he lost,—all that he left behind him did not, according to the duchess of Marlborough, amount to more than £12,000. His treacherous intercourse with James II. was doubtless largely due to the spell of Marlborough's influence; but in any case it indicates that, if in other respects his political conduct was upright and trustworthy, this is to be accounted for by his prudence and certain other mental peculiarities rather than by the strength of his moral principle or his keen sense of honor. His son and successor Francis, who

had married Henrietta, eldest daughter of the duke of Marlborough, in 1698, died in 1766, leaving no male issue.

GODOY. See ALCUDIA.

GODWIN, FRANCIS (1561–1633), son of Dr. Godwin, bishop of Bath and Wells, was born at Havington in Northamptonshire in 1561. He was elected student of Christ Church, Oxford, in 1578, took his bachelor's degree in 1580, and that of master in 1583. Entering holy orders, he became successively rector of Sampford-Orcais in Somersetshire, and vicar of Weston-in-Zoyland in the same county. In 1587 he was appointed subdean of Exeter. Having turned his attention to the subject of British antiquities, he became acquainted with Camden, whom in 1590 he accompanied in a journey through Wales. He was created bachelor of divinity in 1593, and doctor in 1595. In 1601 he published his *Catalogue of the Bishops of England since the first planting of the Christian Religion in this Island*, a work which procured him in the same year the bishopric of Llandaff from Elizabeth. A second edition appeared in 1615, and in 1616 he published an edition in Latin with a dedication to King James, who in the following year conferred upon him the bishopric of Hereford. The work was republished, with a continuation by Dr. Richardson in 1743. In 1616 Godwin published *Rerum Anglicarum, Henrico VIII., Edwardo VI., et Maria regnantibus, Annales*, which was afterwards translated and published by his son under the title *Annales of England*, 1630. The last of his works published before his death, which took place in 1633, was *Computation of the value of the Roman Sesterce and Attic Talent*, which appeared in 1630. He is also the author of a somewhat remarkable story, published posthumously in 1638, and entitled *The Man in the Moon, or a Discourse of a Voyage thither, by Domingo Gonsales*, written apparently some time between the years 1599 and 1603. In this production Godwin not only declares himself a believer in the Copernican system, but adopts so far the principles of the law of gravitation by supposing that the earth's attraction diminishes with the distance. The work, which displays considerable fancy and wit, was translated into French, and was imitated in several important particulars by Cyrano de Bergerac, from whom Swift obtained valuable hints in writing his voyage to Laputa. Another work of Godwin's, *Nuncius Inanimatus in Utopia*, originally published in 1629, but subsequently suppressed, seems to have been the prototype of Wilkins's *Mercury, or Secret and Swift Messenger*, which appeared in 1641. Godwin's pamphlet was again published in 1657.

GODWIN, MARY WOLLSTONECRAFT (1759–1797), an English authoress of the last century, was born at Hoxton, on April 27, 1759. Her family was of Irish extraction, and Mary's grandfather, who was a respectable manufacturer in Spitalfields, realized the property which his son squandered. Her mother, whose maiden name was Dixon, was Irish, and of good family. Mr. Wollstonecraft, after dissipating the greater part of his patrimony, tried to earn a living by farming, which only plunged him into deeper difficulties, and he led a wandering, shifty life. The family roamed from Hoxton to Edmonton, to Essex, to Beverley in Yorkshire, to Laugharne, Pembrokeshire, and back to London again.

After Mrs. Wollstonecraft's death in 1780, soon followed by her husband's second marriage, the three daughters, Mary, Everina, and Eliza, sought to earn their own livelihood. The sisters were all clever women,—Mary and Eliza far above the average,—but their opportunities of culture had been few. They turned their thoughts towards the profession of teaching, and Mary, the eldest, was to make the first venture. She went in the first instance to live with her friend Fanny Blood, a girl of her own age, whose father, like Wollstonecraft, was addicted to drink and dissipation. As long as she lived with the Bloods, Mary helped Mrs. Blood to earn money by taking in needle-work, while Fanny painted in water-colors. Everina went to live with her brother Edward, and Eliza made a hasty and, as it proved, unhappy marriage with a Mr. Bishop. All the Wollstonecraft sisters were enthusiastic, excitable, apt to exaggerate trifles, and to magnify inattentions into slights; and Eliza had the family temperament in excess. Bishop was a man of violent temper, and when his wife's reason had almost given way under the miseries of her married life, Mary resolved to find some means of supporting her, and arranged her secret and sudden flight. A legal separation was afterwards obtained, and the sisters, together with Fanny Blood, took a house, first at Islington, afterwards at Newington Green, and opened a school, which was carried on with indifferent success for nearly two years. During their residence at Newington Green, Mary was introduced to Dr. Johnson, who, as Godwin tells us, "treated her with particular kindness and attention."

In 1785 Fanny Blood married Hugh Skeys, a merchant, and went with him to Lisbon, where she died in childbed after sending for Mary to nurse her. "The loss of Fanny," as she said in a letter to Mrs. Skeys's brother, George Blood, "was sufficient of itself to have cast a cloud over my brightest days. . . . I have lost all relish for pleasure, and life seems a burden almost too heavy to be endured." Her first novel, *Mary, a Fiction*, written in 1787, was intended to commemorate her friendship with Fanny. After closing the school at Newington Green, Mary obtained a situation as governess in the family of Lord Kingsborough, in Ireland, which she held for nearly a year. Her pupils were much attached to her, especially Margaret King, afterwards Lady Mountcashel; and indeed Lady Kingsborough gave the reason for dismissing her that the children loved their governess better than their mother. Mary now resolved to devote herself to literary work, and she was encouraged in this purpose by Johnson, the publisher in St. Paul's Churchyard, in whose house she resided for a few weeks, before she obtained lodgings in George Street, Blackfriars. She acted as Johnson's literary adviser, and undertook translations, chiefly from the French. *Mary, a Fiction*, the story already mentioned, was not published till 1796. *The Elements of Morality*, an old-fashioned book for children, and Lavater's *Physiognomy*, were among her translations. Her *Original Stories from Real Life* were published, with illustrations by Blake, and in 1792 appeared *A Vindication of the Rights of Woman*, the work with which her name is always associated.

It is not among the least oddities of this book that it is dedicated to M. Talleyrand Périgord, late bishop of Autun. Mary Wollstonecraft still believed him to be sincere, and working in the same direction as herself. In the dedication she states the "main argument" of the work, "built on this simple principle that, if woman be not prepared by education to become the companion of man, she will stop the progress of knowledge, for truth must be common to all, or it will be inefficacious with respect to its influence or general practice." In carrying out this argument she used extraordinary plainness of speech, and it was this that caused all, or nearly all, the outcry. For she did not attack the institution of marriage, nor assail orthodox religion; her book was really a plea for equality of education, passing into one for state education and for the joint education of the sexes. It was a protest against the assumption that woman was only the plaything of man, and she asserted that intellectual companionship was the chief, as it is the lasting, happiness of marriage. It may, however, be admitted that she discussed some subjects, not usually mentioned in print, with a certain want of reticence and delicacy. She dealt directly with dangerous and explosive questions, incidentally upheld greater freedom of divorce, and denied the eternity of the torments of hell.

Mrs. Wollstonecraft, as she now styled herself, desired to watch the progress of the Revolution in France, and went to Paris in 1792. Godwin, in his memoir of his wife, considers that the change of residence may have been prompted by the discovery that she was becoming attached to Fuseli, but there is nothing to confirm this surmise; indeed, it was first proposed that she should go to Paris in company with him and his wife, nor was there any subsequent breach in their friendship. She remained in Paris during the Reign of Terror, when communication with England was difficult or almost impossible. Some time in the spring or summer of 1793, Captain Gilbert Imlay, an American, became acquainted with Mary—an acquaintance which ended in a more intimate connection. There was no legal ceremony of marriage, and it is doubtful whether such a marriage would have been valid at the time; but she passed as Imlay's wife, and her brother, Charles Wollstonecraft, wrote from Philadelphia that he had seen a gentleman who informed him "that Mary was married to Captain Imlay of this country." Imlay himself terms her in a legal document, "Mary Imlay, my best friend and wife," and she believed that his love, which was to her sacred, would endure. In August, 1793, Imlay was called to Havre on business, and was absent for some months, during which time most of the letters published after her death by Godwin were written. Towards the end of the year she joined Imlay at

Havre, and there in the spring of 1794 she gave birth to a girl, who received the name of Fanny, in memory of the dear friend of her youth. Imlay became involved in a multitude of speculations, which rendered him restless and dissatisfied, and his affection for Mary and their child was already waning. He left her for some months at Havre, and when he allowed her to join him in England, it appears from her letters that she went with a heavy heart and forebodings of sorrow. In June, 1795, in less than two months after their reunion, Mary again left England for Norway, empowered by the document in which Imlay calls her his wife, to act for him in his business relations with Norwegian timber merchants. Her *Letters from Norway*, divested of all personal details, were afterwards published. She returned to England late in 1795, and found letters awaiting her from Imlay, intimating his intention to separate from her, and offering to settle an annuity on her and her child. For herself she rejected this offer with scorn. "From you," she wrote, "I will not receive anything more. I am not sufficiently humbled to depend on your beneficence." They met again, and for a short time lived together, until the discovery that he was carrying on an intrigue under her own roof drove her to despair, and she attempted to drown herself by leaping from Putney bridge, but she was rescued by watermen. Imlay now completely deserted her, although she continued to bear his name.

In 1796, when Mary Wollstonecraft was living in London, supporting herself and her child by working, as before, for Mr. Johnson, she met William Godwin. A friendship sprang up between them—a friendship, as he himself says, which "melted into love." Godwin states that "ideas which he is now willing to denominate prejudices, made him by no means willing to conform to the ceremony of marriage;" but these prejudices were overcome, and they were married at St. Pancras Church on March 29, 1797. And now Mary had a season of real calm in her stormy existence. Godwin, for once only in his life, was stirred by passion, and his admiration for his wife equalled his affection. But their happiness was of short duration. A daughter, Mary, afterwards the wife of Percy Bysshe Shelley, was born August 30, 1797. At first all seemed to go well, but unfavorable symptoms set in, and on September 10th the mother, after enduring all her sufferings with unvarying gentleness and sweetness of temper, passed away. She was buried in the churchyard of Old St. Pancras, but her remains were afterwards removed by Sir Percy Shelley to the churchyard of St. Peter's, Bournemouth.

Her principal published works are as follows: — *Thoughts on the Education of Daughters*, 1787; *The Female Readers* (selections), 1789; *Original Stories from Real Life*, 1791; *An Historical and Moral View of the Origin and Progress of the French Revolution, and the Effects it has produced in Europe*, vol. i. (no more published), 1790; *Vindication of the Rights of Woman*, 1792; *Vindication of the Rights of Man*, 1793; *Mary, a Fiction*, 1796; *Letters written during a Short Residence in Sweden, Norway, and Denmark*, 1796; *Posthumous Works*, 4 vols., 1798. It is impossible to trace the many articles contributed by her to periodical literature, or to identify the translations executed for Mr. Johnson. A memoir of her life was published by Godwin soon after her decease. A large portion of the work, *William Godwin, his Friends and Contemporaries*, was devoted to her, and a new edition of the *Letters to Imlay*, London, 1879, of which the first edition was published by Godwin, is prefaced by a somewhat fuller memoir. (C. K. P.)

GODWIN, WILLIAM (1756–1836), an English political writer, historian, novelist, and dramatist, was born March 3, 1756, at Wisbeach in Cambridgeshire, at which place his father was a Nonconformist minister. His family came, on both sides, of worthy middle-class people, able to trace their descent in the same level of society for about 150 years; and it was probably only as a joke that Godwin, a stern political reformer and philosophical radical, attempted to trace his pedigree to a time before the Norman conquest and the great Earl Godwine. His father was a cold and dull man, his mother uneducated, but clever, shrewd, and full of sound common sense. Both parents were Calvinists: the father strict in observances beyond what was even then ordinary; the mother regretting in Godwin's maturer years, and when some of her sons had turned out ill, that she had given birth to so many children, who, as she thought, were heirs of damnation. Mr. Godwin, senior, died young, and never inspired love or much regret in his son; but in spite of wide differences of opinion, the most tender affection always subsisted between William Godwin and his mother until her death at an advanced age.

William Godwin was educated for his father's profession, and was at first more Calvinistic than his teachers, becoming a Sandemanian, of which sect he says, that they were the followers of "a celebrated north-country apostle [Glas], who after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin."

He officiated as a minister at Ware, Stowmarket, and Beaconsfield. At the second of these places the teachings of French Reformers were brought before him by a friend, and these, while they intensified his political, undermined his religious opinions. He came to London, still nominally a clergyman, to set about the work of the regeneration of society with his pen—a real enthusiast, who, theoretically, shrank from no conclusions from the premises which he laid down. These were the principles of the Encyclopedists, and his own aim was the complete overthrow of all existing institutions, political, social, and religious. He believed, however, that calm discussion was the only thing needful to carry every change, and from the beginning to the end of his career he deprecated every approach to violence. He was, like Bentham—whom, however, he does not seem to have influenced or been influenced by—a philosophic radical in the strictest sense of the term.

His first published work was an anonymous *Life of Lord Chatham;* the first to which he gave his name was still nominally clerical. Under the inappropriate title *Sketches of History*, he published six sermons on the characters of Aaron, Hazael, and Jesus, in which, though writing in the character of an orthodox Calvinist, he enunciates the pregnant proposition, "God himself has no right to be a tyrant." This was published in 1782, and for the next nine years he wrote largely in the *Annual Register* and other periodicals, producing also three novels, which have more completely vanished from the world than even the contributions to reviews. They were probably not worth preserving, but the "Sketches of English History" written for the *Annual Register* from 1785 onward still deserve study. He joined a club called the Revolutionists, and associated much with Lord Stanhope, Horne Tooke, Holcroft, and others, who, from their political principles and activity, were obnoxious to men in power. It is perhaps needless to say that the title of "reverend" dropped off from him without difficulty, and with no sense of discordance between the old and the new. Doubt and change never seem to have brought with them any keen sense of pain or outrooting. The equable calm of a cold temperament preserved him from much which affects warmer natures; but he also knew that he was at all times seeking after truth, and striving for what seemed right; and while such an one can scarcely be called modest, he is preserved for many qualms which affect more nervous and more self-distrustful persons.

In 1793 Godwin published his great work on political science, *The Inquiry concerning Political Justice, and its Influence on General Virtue and Happiness*. Although this work is little known and less read now, it was one of the epoch-making books of English thought. Godwin could never have been himself a worker on the active stage of life. But he was none the less a power behind the workers, and *Political Justice* takes its place with Milton's *Speech for Unlicensed Printing*, with Locke's *Essay on Education*, with Rousseau's *Émile*, among the unseen levers which have moved the changes of the times. It is therefore necessary to speak of this book more particularly. By the words "political justice" the author meant "the adoption of any principle of morality and truth into the practice of a community," and the work was therefore an inquiry into the principles of society, of government, and of morals. For many years Godwin had been "satisfied that monarchy was a species of government unavoidably corrupt," and from desiring a government of the simplest construction, he gradually came to consider that "government by its very nature counteracts the improvement of original mind." Believing in the perfectibility of the race, that there are no innate principles, and therefore no original propensity to evil, he considered that "our virtues and our vices may be traced to the incidents which make the history of our lives, and if these incidents could be divested of every improper tendency, vice would be extirpated from the world." All control of man by man was more or less intolerable, and the day would come when each man, doing

what seems right in his own eyes, would also be doing what is in fact best for the community, because all will be guided by principles of pure reason. But all was to be done by discussion, and matured change resulting from discussion. Hence, while Godwin thoroughly approved of the philosophic schemes of the precursors of the Revolution, he was as far removed as Burke himself from agreeing with the way in which they were carried out. So logical and uncompromising a thinker as Godwin could not go far in the discussion of abstract questions without exciting the most lively opposition in matters of detailed opinion. An affectionate son, and ever ready to give of his hard-earned income to more than one ne'er-do-well brother, he maintained that natural relationship had no claim on man, nor was gratitude to parents or benefactors any part of justice or virtue. In a day when the penal code was still extremely severe, he argued gravely against all punishments, not only that of death. Property was to belong to him who most wants it; accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and property the worst of all properties. A man so passionless as Godwin could venture thus to argue without suspicion that he did so only to gratify his wayward desires. Portions of this treatise, and only portions, found ready acceptance in those minds which were prepared to receive them. Perhaps no one received the whole teaching of the book. But it gave cohesion and voice to philosophic radicalism; it was the manifesto of a school without which the milder and more creedless liberalism of the present day had not been. Godwin himself in after days modified his communistic views, but his strong feeling for individualism, his hate of all restrictions on liberty, his trust in man, his faith in the power of reason remained; it was a manifesto which enunciated principles modifying action, even when not wholly ruling it.

In May, 1794, Godwin published the novel of *Caleb Williams, or Things as they are*, a book of which the political object is overlooked by many readers in the strong interest of the story. It is one of the few novels of that time which may be said still to live. A theorist who lived mainly in his study, Godwin yet came forward boldly to stand by prisoners arraigned of high treason in that same year—1794. The danger to persons so charged was then great, and he deliberately put himself into this same danger for his friends. But when his own trial was discussed in the Privy Council, Pitt sensibly held that *Political Justice*, the work on which the charge could best have been founded, was priced at three guineas, and could never do much harm among those who had not three shillings to spare.

From this time Godwin became a notable figure in London society, and there was scarcely an important person in politics, on the liberal side, in literature, art, or science, who does not appear familiarly in the pages of Godwin's singular diary. For forty-eight years, beginning in 1788, and continuing to the very end of his life, Godwin kept a record of every day, of the work he did, the books he read, the friends he saw. Condensed in the highest degree, the diary is yet easy to read when the style is once mastered, and it is a great help to the understanding of his cold, methodical, unimpassioned characters. He carried his method into every detail of life, and lived on his earnings with extreme frugality. Until he made a large sum by the publication of *Political Justice*, he lived on an average of £120 a year. In 1797, the intervening years having been spent in strenuous literary labor, Godwin married Mary Wollstonecraft (see last article). Since both held the same views regarding the slavery of marriage, and since they only married at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief. Mrs. Godwin died in giving birth to a daughter, afterwards the second wife of Percy Bysshe Shelley, on September 10, 1797, leaving Godwin, prostrated by affliction, and with a charge for which he was wholly unfit—his own little daughter Mary, and her step-sister, Fanny Imlay, who ever afterwards bore the name of Godwin.* His unfitness for the cares of a family, far more than love, let him to contract a second marriage with Mrs. Clairmont, in 1800. She was a widow with two children, energetic and painstaking, but a harsh stepmother; and it may be doubted whether the children were not worse off under her care than they would have been under Godwin's neglect. The second fiction which proceeded from Godwin's pen was called *St. Leon*, and published in 1799. It is chiefly remarkable for the beautiful portrait of Marguerite, the heroine, which was drawn from the character of his own wife.

The events of Godwin's life were few. Under the advice of the second Mrs. Godwin, and with her active co-operation, he carried on business as a bookseller under the pseudonym of Edward Baldwin, under which name he published several useful school-books and books for children, some by Charles and Mary Lamb. But the speculation was unsuccessful, and for many years Godwin struggled with constant pecuniary difficulties, for which more than one subscription was raised by the leaders of the Liberal party, and by literary men. In his later years the Government of Earl Grey conferred upon him the office known as "Yeoman Usher of the Exchequer," to which were attached apartments in Palace Yard, where he died in the full possession of his faculties, April 7, 1836, having completed his eightieth year.

In his own time, by his writings and by his conversation, Godwin had a great power of influencing men, and especially young men. Though his character would seem, from much which is found in his writings, and from anecdotes told by those who still remember him, to have been unsympathetic, it was not so understood by enthusiastic young people, who hung on his words as those of a prophet. The most remarkable of these was Percy Bysshe Shelley, who in the glowing dawn of his genius turned to Godwin as his teacher and guide. The last of the long series of young men who sat at Godwin's feet was Edward Lytton Bulwer, afterwards Lord Lytton, whose early romances were formed after those of Godwin, and who, in *Eugene Aram*, succeeded to the story as arranged, and the plan to a considerable extent sketched out by Godwin, whose age and failing health prevented him from completing it.

Godwin's more important works are—*The Inquiry concerning Political Justice, and its Influence on General Virtue and Happiness*, 1793; *Things as they are, or the Adventures of Caleb Williams*, 1794; *The Inquirer, a series of Essays*, 1796; *Memoirs of the Author of the Rights of Woman*, 1798; *St. Leon, a Tale of the Sixteenth Century*, 1799; *Antonio, a Tragedy*, 1801; *The Life of Chaucer*, 1803; *Fleetwood, a Novel*, 1805; *Faulkner, a Tragedy*, 1807; *Essay on Sepulchres*, 1809; *Lives of Edward and John Philips, the Nephews of Milton*, 1815; *Mandeville, a Tale of the Times of Cromwell*, 1817; *History of the Commonwealth*, 1824–1828; *Cloudesley, a Novel*, 1830; *Thoughts on Man, a series of Essays*, 1831; *Lives of the Necromancers*, 1834. A volume of essays was also collected from his papers and published in 1873, as left for publication by his daughter Mrs. Shelley. Many other short and anonymous works proceeded from his ever busy pen, but many are irrecoverable, and all are forgotten. Godwin's place in literature is permanent, in that he produced one work which proved effective in changing the course of thought in its time, but not permanent in the sense that his writings will continue to be widely read. His life was published in 1876 in two volumes, under the title *William Godwin, his Friends and Contemporaries*, by C. Kegan Paul. The best estimate of his literary position is that given by Mr. Leslie Stephen in his *English Thought in the 18th Century*.

(C. K. P.)

GODWINE, earl of the West-Saxons son of Wulfnoth, is the leading Englishman in the first half of the 11th century, and he holds a special place in English history generally. He is the first Englishman who plays the part of a minister and a parliamentary leader, of one high in office under the crown who at the same time sways the assemblies of the nation by his power of speech. Such a position was perfectly possible before the Norman Conquest; it did not again become possible for some ages. Godwine appears as the chief champion of England against Norman influence, and as the father of the last English king of the native stock. In these two characters he drew on himself the fullest bitterness of Norman hatred; and to this hatred is doubtless largely, though not wholly, owing the extraordinary contradiction with which the chief events of his life are told, and the amazing slanders which have been heaped upon his memory.

His birth and origin are utterly uncertain. The highest authorities, the contemporary English Chronicles, are silent. There are two alternative statements, which are seemingly quite irreconcilable, but either of which alone would have much to be said for it. By putting together certain passages in the English Chronicles, in Domesday, and in the

will of the Ætheling Æthelstan, son of King Æthelred, a strong presumption is raised that Godwine was the son of Wulfnoth the South-Saxon who was outlawed in 1009, and that his services in the war against Cnut were deemed to entitle him to a restitution of his father's forfeited lands. There is no direct statement to this effect, but a number of undesigned coincidences point towards such a belief. On the other hand, there is a story which appears in various quarters, and which seems to come from more than one independent source, which makes Godwine's father Wulfnoth a churl somewhere on the borders of Gloucestershire and Wiltshire, and which makes Godwine win the favor of the Danish earl Ulf by showing him his way after the battle of Sherstone in 1016. A third account connects Godwine with the family of Eadric the traitor of Æthelred's day; but this version seems at once to be impossible to reconcile with either of the other two stories, and to rest on less authority than either.

But, whatever was Godwine's origin, there is no doubt that, according to Cnut's rule of preferring Englishmen to high office, he rose to power very early in that king's reign. He was an earl in 1018. The next year he distinguished himself at the head of the English troops in Cnut's Northern wars, and received in marriage Gytha, the sister of the king's brother-in-law Earl Ulf. In 1020 he became earl of the West-Saxons, that is, of all England south of the Thames, a new office, doubtless connected with Cnut's frequent absences from England. All this again is not in the Chronicles, though particular points are incidentally confirmed by them. Still this stage of his history seems to be fairly made out from other sources.

From Cnut's death in 1035 the events of Godwine's life are recorded in the Chronicles, often with great minuteness. Much is also learned from the contemporary biographer of Eadward. He asserted the claims of Harthacnut, the son of Cnut and Emma, to the crown of his father; but he had to consent to a division of the kingdom, and could only secure Wessex for Harthacnut, while Harold reigned in Northumberland and Mercia. He then acted as the chief minister of Emma, while she was regent on behalf of Harthacnut during his first reign. During this time the Ætheling Ælfred, son of Æthelred and Emma, landed in England in the hope of winning back his father's crown; but coming into the power of Harold, he was blinded by his order, and died of his wounds. Godwine was said to have betrayed Ælfred to Harold, and the charge was eagerly seized upon by the Norman writers. But it was not invented by them. At the beginning of Harthacnut's second reign in 1040, Godwine was formally accused of the death of Ælfred, and was regularly tried and acquitted. His guilt is asserted in a poem inserted in one of the Chronicles, but the words which tell against him are carefully altered in another version. The story is told with great confusion and contradiction, and the version unfavorable to Godwine seems to be inconsistent with his position at the time as minister, not of Harold, to whom he is said to have betrayed Ælfred, but of Harthacnut, whose kingship seems to be forgotten in the story. Godwine remained in power during the reigns of Harold and Harthacnut, and on the death of the last-named king in 1042, he was foremost in promoting the election of Eadward, the son of Æthelred and Emma, to the vacant throne. As earl of the West-Saxons he was the first man in the kingdom, but his power was still balanced by that of the other great earls, Leofric in Mercia and Siward in Northumberland. His sons Swegen and Harold, together with Beorn, the nephew of his wife Gytha, were promoted to earldoms (1043–1045), and his daughter Eadgyth was married to the king (1045). We hear much of his good and strict government of his earldom, and of his influence with the king and with the whole nation. He was not, however, all-powerful; in one very remarkable case, which is most instructive as a piece of constitutional history, he was out-voted in the witenagemót on a question of foreign policy. In 1047, when his wife's nephew Swegen Estrithson, now king of the Danes, was at war with Magnus of Norway, Godwine proposed to help Swegen with fifty ships; but the notion was opposed by Leofric, and "all folk" accepted the amendment of the Mercian earl. Godwine had also to strive against the king's fondness for Normans and other strangers, above all in the disposal of ecclesiastical offices. Godwine's policy, in this and in other matters, was opposed to all French connections of every kind. Next to Englishmen he favored natives of the kindred Continental lands, and he supported a policy of alliance with the empire and its princes. In all this, at home and abroad, he had specially to withstand the influence of the king's Norman favorite Robert of Jumiéges, appointed bishop of London in 1044 and archbishop of Canterbury in 1051. Godwine was supported by the English bishops Stigand of Winchester and Lyfing of Worcester. The appointment of Robert to the archbishopric marks the decline of Godwine's power, the foreign influence was now at its height, and the English earl was to feel the strength of it.

In the course of 1051 a series of outrages committed by the king's foreign favorites led to a breach between the king and the earl. The king's brother-in-law, Eustace count of Boulogne, returning with his followers from a visit to the king, tried to obtain quarters by force in the houses of the burgesses of Dover. An Englishman who withstood them was killed; a fight followed, in which the count and his company were driven out of the town. The king, hearing the tale from Eustace, bade Godwine inflict military chastisement on the townsmen; the earl refused, and demanded a fair trial of the charge before the witan. About the same time men's minds were stirred by the outrages of several Normans who had received estates in Herefordshire. The influence of the archbishop was used against Godwine, and he was summoned to appear before the witan at Gloucester as a criminal. He and his sons now gathered the whole force of their earldoms, and marched towards Gloucester in arms. They demanded the surrender of count Eustace and of the other strangers who had done outrages, whether at Dover or in Herefordshire. The king called the other earls to his help; war was hindered by the mediation of Leofric, and matters were adjourned to another meeting in London. There the king appeared with an army; Godwine and his sons were arraigned as criminals, and, on refusing to appear without a safe-conduct, were outlawed. Godwine and his whole family now left the kingdom, except his daughter, the Lady Eadgyth, who was banished from court to the monastery of Wherwell. The foreign favorites of the king were now supreme.

The next year the tide turned; the feeling of the nation showed itself in favor of Godwine. When his petition for a removal of his outlawry was refused, he came back from his shelter in Flanders at the head of a fleet. In most parts of England he was welcomed; he sailed up the Thames to London; the army gathered by the king refused to fight against him; and, in a great meeting outside the walls of London, he and his family were restored to all their offices and possessions, and the archbishop and many other Normans were banished. Godwine's friend Stigand succeeded to the archbishopric. The next year Godwine was smitten with a fit at the king's table, and died three days later, April 15, 1052. His death was worked up into a fabulous tale by his Norman enemies.

The patriotism and good government of Godwine are undoubted; but it is plain that he accumulated vast wealth for himself. Sometimes, it was said, he showed little regard to the rights of the church; but in the only case where we hear both sides, that of some lands in Kent disputed between him and the Norman archbishop, it appears that he had a legal claim. It is much more certain that he was unduly bent on the promotion of his own family. His eldest son Swegen gave great and deserved offence by the seduction of Eadgifu, abbess of Leominster, and still more by the treacherous murder of his cousin Beorn. He was outlawed, but was afterwards restored to his earldom. He accompanied his father to Flanders, but did not come back, having gone on a pilgrimage to Jerusalem, on his return from which he died. Of his other sons, the second, Harold, succeeded Godwine in his earldom and Eadward in his kingdom; Tostig, Gyrth, and Leofric, all earls, play a part in the later history; Wulfnoth, the youngest, was a captive of William. Of his daughters the Lady Eadgyth survived her father, husband, and brother, and lived in great honor under the Conqueror. The others were Gunhild and Ælfgifu, the latter of whom appears in the story of Harold's oath to William.

See the English Chronicles and Florence of Worcester, 1035–52; the Life of Eadward, published in the Chronicles and Memorials; the *Encomium Emmæ* or *Gesta Cnutonis*, published by Pertz, and elsewhere; various notices in Domesday, and in the writers of the time generally. All the passages, historical and legendary, bearing on Godwine's life are collected and examined in the appendices to Freeman's *History of the Norman Conquest*, vols. i. ii. (E. A. F.)

GODWIT, a word of unknown origin, the name commonly applied to a marsh-bird in great repute, when fattened, for the table, and formerly abundant in the fens of Norfolk, the Isle of Ely, and Lincolnshire. In Turner's days (1544) it was worth three times as much as a Snipe, and at the same period Belon said of it—"C'est vn Oyseau es delices des Françoys." Casaubon, who Latinized its name "*Dei ingenium*" (*Ephemerides*, 19th September, 1611), was told by the "*ornithotrophœus*" he visited at Wisbech that in London it fetched twenty pence. Its fame as a delicacy is perpetuated by many later writers, Ben Jonson among them, and Pennant says that in his time (1766) it sold for half-a-crown or five shillings. Under the name Godwit two perfectly distinct species of British birds were included, but that which seems to have been especially prized is known to modern ornithologists as the Black-tailed Godwit, *Limosa ægocephala*, formerly called, from its loud cry, a Yarwhelp,[1] Shrieker, or Barker, in the districts it inhabited. The practice of netting this bird in large numbers during the spring and summer, coupled with the gradual reclamation of the fens, to which it resorted, has now rendered it but a visitor; and it probably ceased from breeding regularly in England in 1824 or thereabouts, though under favorable conditions it may have occasionally laid its eggs for some thirty years later or more (Stevenson, *Birds of Norfolk*, ii. p. 250). This Godwit is a species of wide range, reaching Iceland, where it is called *Jardræka* (=earth-raker), in summer, and occurring numerously, it is said, in India in winter. Its chief breeding-quarters seem to extend from Holland eastwards to the south of Russia. The second British species is that which is known as the Bar-tailed Godwit, *L. lapponica*, and this seems to have never been more than a bird of double passage in the United Kingdom, arriving in large flocks on the south coast about the 12th of May, and, after staying a few days, proceeding to the north-eastward. It is known to breed in Lapland, but its eggs are of great rarity. Towards autumn the young visit our coasts, and a few of them remain, together with some of the other species, in favorable situations throughout the winter. One of the local names by which the Bar-tailed Godwit is known to the Norfolk gunners is Scamell, a word which, in the mouth of Caliban (*Tempest*, act ii. scene 2), has been the cause of much perplexity to Shakespearian critics.

The Godwits belong to the group *Limicolæ*, and are about as big as a tame pigeon, but possess long legs, and a long bill with a slight upward turn. It is believed that in the genus *Limosa* the female is larger than the male. While the winter plumage is of a sober greyish-brown, the breeding-dress is marked by a predominance of bright bay or chestnut, rendering the wearer a very beautiful object. The Black-tailed Godwit, though varying a good deal in size, is constantly larger than the Bar-tailed, and especially longer in the legs. The species may be further distinguished by the former having the proximal third of the tail-quills pure white, and the distal two-thirds black, with a narrow white margin, while the latter has the same feathers barred with black and white alternately for nearly their whole length.

America possesses two species of the genus, the very large Marbled Godwit or Marlin, *L. fedoa*, easily recognized by its size and the buff color of its axillaries, and the smaller Hudsonian Godwit, *L. hudsonica*, which has its axillaries of a deep black. This last, though less numerous than its congener, seems to range over the whole of the continent, breeding in the extreme north, while it has been obtained also in the Strait of Magellan and the Falkland Islands. The first seems not to go further southward than the Antilles and the Isthmus of Panama.

From Asia, or at least its eastern part, two species have been described. One of them, *L. melanuroides*, differs only from *L. ægocephala* in its smaller size, and is believed to breed in Amurland, wintering in the islands of the Pacific, New Zealand, and Australia. The other, *L. uropygialis*, is closely allied to and often mistaken for *L. lapponica*, from which it chiefly differs by having the rump barred like the tail. This was found breeding in the extreme north of Siberia by Dr. von Middendorff, and ranges to Australia, whence it was, like the last, first described by Mr. Gould.

(A. N.)

GOES, or Ter Goes, a town of the Netherlands in the province of Zealand, on the island of South Beveland, with railway communication since 1868 with Bergen-op-Zoom, and since 1872 with Middelburg, its distances from these places being respectively 12 and 15 miles. The Reformed church, called in the olden times St. Mary Magdalen's, is considered the finest ecclesiastical building of Zealand, and dates from 1423. In the one half, known as the Preekkerk or preaching church, there is a splendid organ, and in the other half, known as the Wandelkerk or walking church, stands the tomb of Frans Naerebout the philanthropist. Goes further boasts of a fine old town-house, a high school, and the remains of the old castle of Ostende, which was the nucleus round which it began to form itself in the 14th century. The industries of the town are varied but not extensive, dealing with linen, dyes, chocolate, oil, flour, straw hats, wood, and cigars. Ship-building is also carried on, as well as a trade in wood and coals. The harbor, which is defended by a fort, is formed by a short canal communicating with the eastern Scheldt, extended and improved in 1818–19. The population of the town, which received its municipal rights in 1406, and was surrounded with a wall about 1420, numbered 4916 in 1860, 5205 in 1870, and 7000 in 1900.

GOES, Hugo van der ( ? –1482), a painter of considerable celebrity at Ghent, was known to Vasari, as he is known to us, by a single picture in a Florentine monastery. At a period when the family of the Medici had not yet risen from the rank of a great mercantile firm to that of a reigning dynasty, it employed as an agent at the port of Bruges Tommaso Portinari, a lineal descendant, it was said, of Folco, the father of Dante's Beatrix. Tommaso, at that time patron of a chapel in the hospital of Santa Maria Nuova at Florence, ordered an altar-piece of Hugo van der Goes, and commanded him to illustrate the sacred theme of "*Quem genuit adoravit.*" In the centre of a vast triptych, comprising numerous figures of life size, Hugo represented the Virgin kneeling in adoration before the new-born Christ attended by Shepherds and Angels. On the wings he portrayed Tommaso and his two sons in prayer under the protection of Saint Anthony and St. Matthew, and Tommaso's wife and two daughters supported by St. Margaret and St. Mary Magdalen. The triptych was sent to Florence, and placed on the altar upon which it still remains. Van der Goes, like Hubert Van Eyck and Jodocus of Ghent, has bequeathed but this one picture to posterity; but it is a picture which shows that he was an artist of whom Ghent might be proud, as Bruges was proud of John Van Eyck and Brussels of Roger van der Weyden. Unhappily the triptych of Santa Maria Nuova suffered so much from decay and restoring that the defects peculiar to the Flemings became unduly prominent as time and neglect effaced the brilliancy and harmony of the principal colors. We can only discern at the present day that the art of Van der Goes is a variety of that which characterizes Van Eyck and Van der Weyden. Less finished and less colored than the work of the first, it is less subtle and expressive than that of the second. It lacks depth of religious feeling, and hardly rises above the common level of the school in respect of feeling or execution. It is a cold and stiff art, marked by hardness of surface, dryness of contour, angularity of drapery, overladen ornament, and ill-balanced light and shade. Imposing because composed of figures of unusual size, the altar-piece is more remarkable for portrait character than for charms of ideal beauty. There are small pieces in public galleries which claim to have been executed by Van der Goes, but none that are certified as the work of his hands. One of these pictures in the National Gallery in London is more nearly allied to the school of Memling than the triptych of Santa Maria Nuova; another, a small and very beautiful John the Baptist, at the Pinakothek of Munich, is really by Memling; whilst numerous fragments of an altar-piece in the Belvedere at Vienna, though assigned to Hugo, are by his more gifted countryman of Bruges. Any one who visits Continental collections will see that the name of Van der Goes was given to pictures of which he could not have been the author. None of the compositions mentioned by historians have survived except the altar-piece at Florence. But Van der Goes was not habitually a painter of easel pieces. He made his reputation at Bruges by producing colored hangings in distemper. After he settled at Ghent, and became a master of his guild in 1465, he designed cartoons for glass windows. He also made decorations for the wedding of Charles the Bold and Margaret of York in 1468, for the festivals of the Rhetoricians and papal jubilees on repeated occasions. for

[1] This name seems to have survived in Whelp Moor, near Brandon, in Suffolk.

the solemn entry of Charles the Bold into Ghent in 1470–1, and for the funeral of Philip the Good in 1474. The labor which he expended on these occasions might well add to his fame without being the less ephemeral. About the year 1475 he retired to the monastery of Rouge Cloitre near Ghent, where he took the cowl. There, though he still clung to his profession, he seems to have taken to drinking, and at one time to have shown decided symptoms of insanity. But his superiors gradually cured him of his intemperance, and he died in the odor of sanctity in 1482.

Birth and education.

GOETHE, JOHANN WOLFGANG VON (1749–1832), was born in Frankfort on August 28, 1749. His parents were citizens of that imperial town, and Wolfgang was their only son and their eldest child. His father was born on July 31, 1710, and in 1742 received the title of imperial councillor. He married on August 20, 1748, at the age of thirty-eight, Catherine Elizabeth Textor, a girl of seventeen. Her family was better than his own, and held a higher position in the town. Her father was imperial councillor, and had been schultheiss or chief magistrate. In December, 1750, was born a daughter, Cornelia, who remained until her death, at the age of twenty-seven, her brother's most intimate friend. She was married in 1773 to John George Schlosser. The house in which Goethe was born is still to be seen in the Hirschgraben. Goethe has described to us how it was rebuilt, and it has since been much altered. His education was irregular; he went to no school, and his father rather stimulated than instructed him. But the atmosphere by which he was surrounded gave him, perhaps, the best education he could have received. Frankfort, a free town of the empire, still preserved the appearance of the Middle Ages. It had lost the reality of power, but its citizens naturally grew up with a strong sense of independence, and a power of realizing the unity of Germany which was wanting in a small state. The boy from his earliest youth was accustomed to the companionship of his elders. His father was strict and formal, his mother quick and lively, inspired with no small share of the genius of her son. Goethe lived in the freest intercourse with every kind of society in the town, in which he might expect some day to be an important personage. There was no capital like London or Paris to call him away; Berlin was poor and distant, Vienna half Italian and half Spanish. Goethe must have been brought up with the ambition to take his degree at the university as doctor, to return home and become an advocate, to make a rich marriage, to go through the regular course of civil offices, to inherit his father's house, and perhaps one day to be burgomaster. His home was a cultivated one. The father was fond of art and of the German poetry then in fashion. The influence of Lessing had scarcely made itself felt; Herder was only five years older than Goethe himself. Gellert and Gottsched were the two oracles of poetry,—Gottsched a pedantic product of the earlier French culture, Gellert old and immovable, and unable to comprehend the new spirit. The chief debt that Goethe owed to him was the improvement in his handwriting, on which Gellert laid great stress, and which he coupled with moral excellence. Goethe's father had a great respect for these rhyming poets, and he so strongly objected to the new German hexameters that Wolfgang could only read Klopstock's *Messiah* with his sister in the greatest secrecy and in terror of discovery. He did, however, read it, and learned much of it by heart. French culture gave at this time the prevailing tone to Europe. Goethe could not have escaped its influence, and he was destined to fall under it in a special manner. In the Seven Years' War, which was now raging, France took the side of the empire against Frederick the Great. Frankfort was full of French soldiers, and a certain Comte Thorane, who was quartered in Goethe's house, had an important influence on the boy. Still more strongly was he affected by the French company of actors, whom he came to know both on and off the stage. He learned to declaim in this manner passages of Racine without understanding a word of them. At a later period he knew French thoroughly well, and composed both prose and poetry in that language. His first writings were imitations of the French manner; his earliest play was the imitation of a French after-piece. We can understand how these different forces were to work upon his future life. From his father he derived the steadfastness of character which enabled him to pursue an independent career of self-culture and devotion to art in the midst of every kind of distracting influence; from his mother he inherited the joyous nature and lively sympathy, the flow of language and love of narration, without which he could not have been a poet. Before the age of sixteen he had seen every kind of life in a city particularly favorable to a richness of individual character; he was entirely free from the prejudices of a small state; and as far as he cared for Germany he cared for it as a whole. He was tinged at an early age with the influence of the clearest and most finished language in Europe, and this influence, uniting with the natural clearness of Goethe's mind, made his prose a new phenomenon in the literature of his country, unlike anything which had been seen before. Lastly, with the most passionate aspirations for freedom and independence of life, he was born into the slavery of a mechanical career of prosaic prosperity, the pressure of which was not strong enough to confine him, but was strong enough to stimulate all his efforts to break the bonds.

First love.

Goethe, if we may believe his autobiography, experienced his first love about the age of fifteen in the person of Gretchen, whom some have supposed to be the daughter of an innkeeper at Offenbach. He worshipped her as Dante worshipped Beatrice. She treated him as a child, much as Miss Chaworth treated Byron. But there is no other evidence of this first love, and it would be quite in accordance with Goethe's manner to enlarge on a very small foundation, or to concentrate on one person the feelings which were devoted to several individuals. His letters speak of a boyish love for one Charitas Meixner, a friend of his sister, two years younger than himself, the daughter of a rich merchant at Worms. He expresses his affection for her with all the fervor of French phraseology, and the passion did not leave him when he had removed to Leipsic. But Charitas was able to console herself with another engagement. She married in February, 1773, a merchant of her native town, and died at the end of the following year.

Leipsic.

In the autumn of 1765 Goethe, who had just completed his sixteenth year, travelled to Leipsic in the company of a bookseller, Fleischer, and his wife who were on their way to attend the fair. On the 19th of October he was admitted as a student of the Bavarian nation, one of the four into which the university was divided. For his lodging he had two neat little rooms in the Feuerkugel, the Fire Ball, looking into the long courtyard which leads from the old market to the new. When we remember that his three years at Leipsic, about which so much has been written, correspond with the last three years of an English boy at a public school, we can form some idea of the singular individuality of his character and the maturity and ripeness of his genius. He was sent to Leipsic to study law, in order that he might return to Frankfort fitted for the regular course of municipal distinction. For this purpose he carried with him a letter to Professor Böhme, who taught history and imperial law in the university, but had no other distinction to recommend him. He told Professor Böhme that he intended to devote himself not to law but to belles lettres, or, to use the word which F. A. Wolf had invented, philology. Böhme did his best to dissuade him, and in this was assisted by his wife. The effect of their advice was rather to disgust Goethe with modern German literature, to make him despise what he had already written, and to drive him into the distractions of society, which wasted both his time and his money. He did, however, attend some lectures. He heard Ernesti on Cicero's *Orator*, but he dealt rather with questions of grammar than of taste. He attended Gellert's lectures on literature, and even joined his private class. Gellert held a high position among German men of letters, which was due quite as much to his character as to his genius. He advised Goethe to desert poetry for prose, and to take to authorship only as an employment subordinate to the serious occupations of his life. Goethe tells us that in his lectures upon taste he never heard Gellert mention the names of Klopstock, Kleist, Wieland, Gessner, Gleim, or Lessing. He also attended the lectures of another literary professor, Clodius, a young man about ten years older than himself. Clodius corrected Goethe's writings with red ink, and pointed out the faults without showing the way to mend them. Goethe had written a poem of congratulation for the marriage of his uncle Textor (February 17, 1766), which, according to the fashion of

the time, was full of gods and goddesses and other mythological apparatus. Clodius was unsparingly hard upon this production, and Goethe then perceived that his critic was just as faulty as himself in the use of abstractions and strange outlandish words to give weight and authority to his verse. He satirized Clodius in a poem in praise of the cakes of the confectioner Händel, and by a parody of his drama *Medon*. His position towards the professors of his university was not an enviable one. His real university education was derived from intercourse with his friends. First among these was J. G. Schlosser, who afterwards married his sister. Goethe used to dine with him at a table d'hôte kept by a wine-dealer, Schönkopf, in the Brühl (No. 79), in a house which still exists. Schlosser, who was at this time private secretary to the duke of Würtemberg and tutor to his children, was ten years older than Goethe. He had a great influence upon him, chiefly in introducing him to a wider circle of German, French, English, and Italian poetry. At the table of Professor Ludwig, where Goethe had previously dined, the conversation had generally turned on medical and scientific subjects. Another friend of Goethe's was Behrisch, tutor to the young Count Lindenau. He was a man in middle life, and he combined originality of character and clearness of literary judgment with a dry and caustic wit, and an ever-abiding sense of humor, much in the same proportions as were found in Merck, who exercised at a later period an important influence over Goethe's career. His friendship with Goethe was not at first of advantage to him. He was deprived of his tutorship from a suspicion that he did not always keep the most select society, and his successor was forbidden to allow his charge to associate with the young poet. This is supposed to have been caused by Goethe's disrespectful behavior to Professor Clodius. Gellert obtained for Behrisch an educational post at the court of Dessau, and Goethe kept up a constant correspondence with him till his death in 1809. Behrisch would not allow Goethe to print his poems, but copied them out instead in a beautiful hand. He probably had a considerable effect in producing the simplicity and naturalness of Goethe's early style.

Oeser. But the person who had the strongest effect on Goethe's mental development was Adam Frederick Oeser, at this time director of the academy of arts in Leipsic. Goethe took lessons from him in drawing, and, not content with this, tried his hand at etching. A little device of his for a book-plate or a bill-head is extant, in which a slab with the name C. G. Schönkopf is represented with three bottles above and a wreath of flowers below. Oeser had been a friend of Winckelmann's, and exercised great influence over his views of art. This was a source of considerable reputation to him, and Winckelmann's tragic death, the news of which reached Leipsic whilst Goethe was there, must have brought the relation between them into stronger relief. Goethe always spoke of Oeser's influence with the greatest affection and respect. He writes—"Oeser's discoveries have given me a fresh opportunity of blessing myself that I had him for my instructor. He entered into our very souls, and we must indeed have been without souls not to have derived benefit from him. His lessons will produce their effects through all the rest of my existence. He taught me that the ideal of beauty is simplicity and repose." We find Goethe at Weimar continually consulting Oeser for designs for furniture and for theatrical entertainments.

Käthchen Schönkopf. Goethe from his earliest years was never without a passion, and at Leipsic his passion was Kitty Schönkopf, the Aennchen of the autobiography, the daughter of the host at whose house he dined. She often teased him with her inconstant ways, and to this experience is due his first drama *Die Laune des Verliebten*, "Lovers' Quarrels," as it may be styled. It is a mere trifle, a pastoral in one act, written in alexandrines in the French style. Two happy and two unhappy lovers are contrasted. The only interest of the piece is that it is a fragment from Goethe's own life. A deeper chord is struck in *Die Mitschuldigen* (The Fellow Sinners), which forms a dismal and forbidding picture both of the time and of the experiences of the youth who wrote it. The daughter of an innkeeper has made an unhappy marriage, and is visited by a former lover who is in good circumstances. An assignation is arranged, and the interview is witnessed by the husband, who has come to steal the stranger's purse. The father comes in to read one of the stranger's letters. He is surprised, and is with his daughter suspected of the theft. The real culprit is discovered, but defends himself by accusing the stranger of his conduct to his wife. So they are all guilty. This play was first written in one act. It was afterwards enlarged to three acts, and published in 1787. The manuscript, which still exists, was given to Frederike Brion of Sesenheim. Besides these plays Goethe wrote at Leipsic twenty little songs of an erotic character, which were set to music by his young friend Breitkopf. He describes them as moral-sensuous, but they are more sensuous than moral. They have the merit of a musical easy flow of expression, various moods of passion, with a happy readiness and elegance. Only a few of them were included in his collected works, and those very much altered. They show the influence of Wieland, but by one side of Wieland Goethe was never affected. He was never led to mingle classical ideas and emblems with the unrestrained and sensual frivolity which was disseminated from France. He never imitated Agathon or Musarion. Whatever may have been the bitterness of his experience of life, or the waywardness of his excited fancy, he conceived a true idea of the real nature of classical art. In this Winckelmann and Lessing were his teachers, and he was never untrue to the lessons which they inculcated. This was the most valuable possession he brought back from Leipsic. He had an opportunity of establishing his principles of taste during a short visit to Dresden, in which he devoted himself to the pictures and the antiques. The end of Goethe's stay at Leipsic was saddened by illness. One morning at the beginning of the summer he was awakened by a violent hemorrhage. For several days he hung between life and death, and after that his recovery was slow, although he was tended with the greatest anxiety by his friends. He finally left Leipsic far from well on August 28, 1768, his nineteenth birthday.

Frankfort. Goethe made an enforced stay of a year and a half in his native town. It was perhaps the least happy part of his life. He was in bad health. His cure proceeded slowly, and he had several relapses, and the weakness of the lungs, which was his first complaint, was succeeded by a weakness of the digestion, which was yet more troublesome and painful. The society of Frankfort seemed to him far less agreeable than that of Leipsic; he contrasted the cold, stiff, formal, old-fashioned life of the imperial city with the freshness, geniality, and intellectual activity of the Saxon university. His family relations were not pleasant. His grandfather Textor was struck with paralysis; his father showed but little sympathy with his aspirations for universal culture, and could imagine no career for him but that of a successful jurist. His sister had grown somewhat harsh and cold during his absence, and was possessed by a morbid self-consciousness, which she committed to the confidential pages of a secret diary. The tone of this diary, partly the result of family temperament, partly of the character of the age, throws an interesting light on the despair of Werther. Goethe's mother was always the same to him, a bright, genial, sympathetic friend. But her love could not ward off the pressure of circumstances, or supply a substitute for a wider and more unfettered life. Goethe, during his illness, received great attention from Fräulein von Klettenberg, a friend of his mother's, a pietist of the Moravian school. She initiated him into the mystical writings of those abstracted saints, and she engaged him in the study of alchemy, which served at once to prepare him for the conception of *Faust* and for the scientific researches of his later days. During his stay at Frankfort he wrote very little. It may be that the two Leipsic dramas received here their completed form. A farce in memory of his Leipsic life, a poetical letter to Frederike Oeser, the daughter of his teacher, a few songs, some of them religious, make up the tale of his productions, as far as we know them.

Strasburg. He arrived at Strasburg April 2, 1770. It was intended that after a sojourn in the university of that place he should visit Paris, the centre of refinement. Goethe stayed in Strasburg till August 28, 1771, his twenty-second birthday, and these sixteen months are perhaps the most important of his life. During them he came into active contact with most of those impulses of which his after life was a development. If we would understand his mental growth, we must ask who were his friends. He took his meals at the house of the Fräulein

Lauth in the Krämergasse. The table was mainly filled with medical students. At the head of it sat Salzmann, a grave man of fifty years of age. His experience and his refined taste were very attractive to Goethe, who made him his intimate friend. Goethe was soon drawn by the studies of his companions to desert his own. A note-book of this date is preserved, which gives us a full account of his studies and employments. He attended lectures on anatomy, on midwifery, and on chemistry. His own studies were chiefly devoted to the last science; and he did not forget his favorite alchemy. He had brought with him to Strasburg introductions to pietistic circles, and this made him at first somewhat staid and retired in his pleasures, and disinclined for general society. This soon wore off, and the natural cheerfulness of his genial nature returned to him. Two songs, *Blinde Kuh* and *Stirbt der Fuchs so gilt der Balg*, refer to the social life of this period. He went on picnics, he wrote French poetry, he took dancing lessons, he learnt the violoncello. The table of the Fräulein Lauth received some new guests. Among these was Jung-Stilling, the self-educated charcoal-burner, who in his memoir has left a graphic account of Goethe's striking appearance, his broad brow, his flashing eye, his mastery of the company, and his generosity of character. Another was Lerse, a frank open character, who became Goethe's favorite, and whose name is immortalized in *Götz von Berlichingen*. Goethe did not desert his studies in art. He learnt from the constant study of the cathedral of Strasburg the effect of Gothic architecture, and he shuddered when he saw the reception-rooms of the youthful Marie Antoinette hung with tapestries which represented the marriage of Jason and Medea, and seemed to forebode the coming doom. His diary also shows that he spent much time in philosophical speculation. But the most important event of his Strasburg sojourn was his acquaintance with Herder. He was five years older than Goethe. Herder was then travelling as tutor to the young prince of Holstein-Eutin, but was obliged to spend the whole winter of 1770–71 in Strasburg on account of an affection of his eyes. Goethe was with him every day, often all day. Herder, who was a pupil of a more original genius, Hamann, taught him the true value of nature in art, and the principles of what we should now call the romantic school. He made *Ossian* known to him, and the wealth of popular poetry in all nations which the publication of *Ossian* revealed; he enchanted him with the idyllic simplicity of the *Vicar of Wakefield;* but, above all, he shook his sensibility to the roots by revealing to him the power of the mighty Shakespeare. He now saw how far superior Homer was to his Latin imitators, and how false were the canons of French art. Goethe's spirit was liberated from its trammels, and *Götz* and *Faust* and *Wilhelm Meister* became possible to his mind. At a later period he forged for himself fetters of a different kind.

Sesenheim.

Goethe's stay at Strasburg is generally connected still more closely with another circumstance,—his passion for Frederike Brion of Sesenheim. The village lies about twenty miles from Strasburg, and her father was pastor there. Goethe was introduced by his friend Weyland, an Alsatian, as a poor theological student. Fresh from his study of Goldsmith, he found the *Vicar of Wakefield* realized. The father was a simple worthy man, the eldest of the three daughters was married, the two younger remained,—Maria Salome, whom Goethe calls Olivia, and Frederike, to whom the poet principally devoted himself. She was tall and slight, with fair hair and blue eyes, and just sixteen years of age. Goethe gave himself up to the passion of the moment; what he felt and suffered is known to us by his songs. At least ten songs are addressed to her, and several others were written for her. During the winter of 1770, in the intervals of his conversations with Herder, Goethe often rode over to Sesenheim. Neither storm, nor cold, nor darkness kept him back. He should have been busy with his dissertation for the degree of doctor. The subject he had chosen was the duty of providing an established church. But the attractions of Frederike were a great interruption to his labors. In the spring Herder went away. The fine weather drew him still more strongly to Sesenheim. Picnics, water parties, games, dances, illuminated by enthusiasm for literature, filled up the weeks. As his time for leaving Strasburg came nearer, he felt that his love was merely a dream, and could have no serious termination. Frederike felt the same on her side. A visit of the mother and daughters to Strasburg in July made this appear more clearly. On August 6th Goethe took his degree as doctor of law. Shortly afterwards he bade adieu to Sesenheim, and the tears stood in Frederike's eyes as he reached out his hand from horseback. From Frankfort he wrote his final farewell, and it was then, as he tells us, that he found from her answer for the first time how deeply she had loved him. The account of this love episode in the autobiography does Goethe injustice. There is nothing in the letters or the poems of the time to show that he had wantonly trifled with her affections. Eight years afterwards, on his way to Switzerland, he spent a night with the Brions at Sesenheim, and was received with the utmost kindness. He was shown the arbor where he had sat, the songs he had written, the carriage he had painted. He left them in the morning with content. Frederike lived till 1813, well known for her works of charity. She never married; the heart that Goethe had loved, she said, should never love another.

Return to Frankfort.

Goethe's return to Frankfort is marked by a number of songs, of which the "Wanderer's Sturmlied" is the most remarkable. He found his Frankfort existence more intolerable than before. He had outgrown many of the friends of his youth. Those with whom he felt most sympathy were the two Schlossers and his sister Cornelia. He found in her one who sympathized with all his aspirations. He cared nothing for his profession; he was more determined than ever to devote himself to letters, and not to law. He found in the neighboring town of Darmstadt a literary circle which Frankfort did not supply. The landgravine Caroline set a good example, and had collected round her a number of kindred spirits, men and women. Among them were Wenck, and Petersen, and Caroline Flachsland, who was afterwards to marry Herder. But the soul of the literary circle was Merck, now thirty years of age, attached to the war office. Goethe has represented him in the autobiography as a cold and unfeeling cynic, a spirit who always said no, a prototype of Mephistopheles. History represents him otherwise as a man of cultivated and chastened judgment, a represser of enthusiasm, a respecter of the rules of art, anxious to hold the balance between the old school and the new. Goethe had dominated over all his other friends; Merck dominated over him. He has left but little of his own writings. He was one of those who inspire genius in others, and whose truest picture lives in the recollections of their friends. These months were full of literary activity. To them belong an oration on Shakespeare, delivered at Frankfort, an essay on Erwin von Steinbach, the builder of the Strasburg cathedral, two theological treatises of a neologistic character on the commandments of Moses and the miraculous tongues of Pentecost, and a number of reviews written for the *Frankfurter Gelehrte Anzeiger*, which had been founded by Merck. But the work into which he threw all his genius was the dramatization of the history of the imperial knight of the Middle Ages, Gottfried or Götz von Berlichingen.

*Götz von Berlichingen.*

The immediate cause of this enterprise was his enthusiasm for Shakespeare. After reading him he felt, he said, like a blind man who suddenly receives his sight. The unities of time and place vanished into nothing. The true form of art was seen to be tha which holds the wayward impulses together by an invisible bond, just as in the life of man necessity is wedded to free will. The study of a dry and dull biography of Götz, published in 1731, supplied the subject for his awakened powers. From this miserable sketch he conceived within his mind a complete picture of Germany in the 16th century. The chief characters of his play are creatures of his imagination representing the principal types which made up the history of the time. Every personage is made to live; they speak in short sharp sentences like the powerful lines of a great master's drawing. The first sketch of *Götz* was finished in six weeks, in the autumn of 1771. Cornelia was consulted at every stage in the work. Herder saw it, and gave his approval. On his return from Wetzlar in 1773 Goethe wrote the piece over again, and published it, with the help of Merck, in the form in which we now possess it. It ran like wild-fire through the whole of Germany. It was the progenitor, not only of the "Sturm und Drang" period to which it gave the tone, but of the romantic knightly literature which teemed from the German press. At a later period, in 1804, Goethe prepared another edition for the stage, which took five hours in acting. It has never been represented since.

Wetzlar. With the manuscript of *Götz* in his pocket, Goethe left Frankfort in the spring of 1772 for Wetzlar, a quiet country town on the Lahn, one of the seats of government of the Holy Roman Empire. The emperors lived at Vienna; they were crowned at Frankfort; they held their parliaments at Ratisbon, and at Wetzlar their courts of justice. It was the custom for young lawyers to attend the sittings of these courts for a certain time before they could be admitted to practise on their own account. The company of these students, of the embassies from the component parts of the empire, and of various imperial officials, made the society a pleasant and lively one. Goethe soon found friends. The secretary of the Brunswick legation, Goué, formed a round table of knights,—a Ritter-tafel. The members adopted names from the age of chivalry, and apportioned among themselves the neighboring villages as commanderies and fiefs. Goethe took the name of Götz. Deeds of prowess were performed in friendly rivalry, chiefly of eating and drinking. This masquerade at least served to keep the idea of Götz constantly before his mind. But the place has sadder associations. It is impossible to dissociate the name of Wetzlar from that of Werther. The Deutsches Haus, then the property of the knights of the Teutonic order, exists still in the main street of Wetzlar. It was occupied by one of the officials of the order, by name Buff, an honest man with a large family of children.

Lotte Buff. The second daughter, Lotte, blue-eyed, fair, and just twenty years of age, was first met by Goethe shortly after his arrival at a ball at Wolpertshausen. She strongly attracted him; he became a constant visitor at the house. He found that Lotte was a second mother to her brothers and sisters, and he delighted to play games with them and tell them stories. Lotte was really though not formally engaged to Kestner, a man of two-and-thirty, secretary to the Hanoverian legation. The discovery of this relation made no difference to Goethe; he remained the devoted friend to both. He visited Lotte and her children; he walked with Kestner about the streets till midnight; they kept their common birthday together in the German house on the 28th of August; Kestner felt no jealousy; Goethe was content with Lotte's friendship; her heart was large enough for both. But the position was too critical to last. On September 10 they met in the German house for the last time. Lotte spoke of the other world, and of the possibility of returning from it. It was arranged between them that whoever died first should appear to the others. This conversation confirmed Goethe's purpose; he determined to go away. He made no adieu, but wrote a line to Kestner to say that he could not have borne to stay a moment longer. Merck had probably persuaded him to this step. To divert his mind he took him to Ehrenbreitstein and introduced him to Sophie la Roche, the friend of Wieland's youth, and to her daughter Maximiliane, with whom Goethe was charmed. The places in the neighborhood of Coblentz were visited. Goethe returned to Frankfort by the river in a yacht. Here he was possessed with the memory of Lotte. He fastened her silhouette over his bed. Kestner came to Frankfort in September; Goethe and Schlosser went together to Wetzlar in November. Here he heard of the death of Jerusalem, a young man attached to the Brunswick legation. He had been with Goethe at the university of Leipsic, but he had seen little of him at Wetzlar. Of a moody temperament, disheartened by failure in his profession, and soured by a hopeless passion for the wife of another, he had borrowed a pair of pistols from Kestner under pretence of a journey, and had shot himself on the night of October 29.

*Werther* Goethe obtained a full narrative of the circumstances from Kestner, and immediately afterwards began his *Werther*, in which the circumstances above related are all interwoven. Goethe tells us that it was written in four weeks, but this can hardly have been the case. We have notices of its slow progress during the whole of the summer of 1773. In 1774 it is far advanced enough to be shown to some intimate friends. It is not till the middle of September, 1774, that two copies of the book are sent in the greatest secrecy to Sophie la Roche and Lotte Buff. In October it spread over the whole of Germany. It was enthusiastically beloved or sternly condemned. It was printed, imitated, translated into every language of Europe, criticised in every periodical, with the fullest meed of praise or scorn. It made the round of the world, and penetrated even to China. The *Werther* fever wrung the hearts of men and women with imaginary sorrows; floods of tears were shed; young men dressed in blue coats and yellow breeches shot themselves with *Werther* in their hands. It opened the floodgates of pent-up sentimentalism which had been stirred by the philosophy of the time, and which the calamities of the next generation were sternly to suppress. It may be imagined that Kestner and Lotte were not well satisfied with the liberty which Goethe had taken with them. They were married on April 4, 1773, and Goethe provided the wedding ring. Notwithstanding the coolness which the publication of *Werther* produced between them, the correspondence between Goethe and Kestner continued to the end of the century. Lotte saw Goethe in Weimar in 1816, when she was 63 years old; she was still beautiful, but her head shook with palsy. She died in 1828. The second part of *Werther* represents the agony of a jealous husband. This was inspired by Bretano, an Italian merchant resident in Leipsic, a widower with five children, who had married Maximiliane, the daughter of Sophie la Roche. Goethe loved her as an elder brother, but her husband scarcely approved of the intimacy. Merck tells us that his ideas went very little beyond his business, and that it was dispiriting to have to look for his young girl friend among barrels of herrings and piles of cheeses. "Goethe," he says, "much consoles her for the smell of oil and cheese, and for her husband's manners." *Götz* and *Werther* formed the solid foundation of Goethe's fame. They were read from one end of Germany to the other. It is difficult to imagine that the same man can have produced both works, so different are they in matter and in style. *Werther* represents the languid sentimentalism, the passionate despair, which possessed an age vexed by evils which nothing but the knife could cure, and tortured by the presence of a high ideal which revealed to it at once the depth of its misery and the hopelessness of a better lot. *Götz* was the first manly appeal to the chivalry of German spirit, which, caught up by other voices, sounded throughout the fatherland like the call of a warder's trumpet, till it produced a national courage founded on the recollection of an illustrious past, which overthrew the might of the conqueror at the moment when he seemed about to dominate the world. *Werther* is the echo of Rousseau, the lamentation of a suffering world; *Götz* is the prototype of Stein, the corner stone of a renovated empire. *Götz*, in its short, sharp dialogue, recalls the pregnant terseness of mediæval German before it was spoilt by the imitators of Ciceronian Latinity. *Werther*, as soft and melodious as Plato, was the first revelation to the world of that marvellous style which, in the hands of a master, compels a language which is as rich as Greek to be also as musical.

Satires. These two great works were not the only occupations of Goethe at this time. In Wetzlar he had translated Goldsmith's *Deserted Village*, and had written a number of small poems addressed to Lotte. The spring of 1773, which witnessed the publication of *Götz*, saw him actively employed as an advocate. His relations with his father became easier. His literary success brought him a number of friends,—the young Counts Stolberg, and Von Schönborn, a friend of Klopstock's. He also began to correspond with Lavater the physiognomist and with Klopstock himself. To the latter half of this year are to be referred a number of satirical poems, aimed at prevailing follies of the time, clever and amusing, but of little permanent value. In *Peter Brey* he satirized the meddler Leuchsenring, who, with soft tread and lamblike manners, interfered with the family relations of Herder. *Satyros* is directed against the prophets of the school of nature, who bid us return to nature without remembering how coarse and repellent some aspects of nature are. Bahrdt had translated the Bible into modern cultivated German; Goethe wrote a prologue to this newest of divine revelations, in which the four evangelists appear each with his attendant animal. Of yet another kind is the *Fair of Plundersweilern*, in which the hucksters and booth-keepers represent the motley variety of human life and the characteristics of modern littérateurs. It is a foretaste of the second part of *Faust*. *Harlequin's Marriage* is only preserved in fragments; it was perhaps too coarse and personal to be published. The most important of these writings is *Gods, Heroes, and Wieland*, a dialogue in the style of Lucian written at a sitting over a bottle of Burgundy, in which Alcestis, Mercury, Hercules, Euripides, and other ancient

worthies appear to Wieland in all their original greatness, and upbraid him with the mean and paltry representation of them which he had given to the world. Wieland was the apostle of an emasculated antiquity. Goethe would make the gods speak in their own large utterance if they spoke at all. Wieland revenged himself by recommending the satire in his paper, the *Deutsche Merkur*, as a delicate piece of persiflage worthy of the study of his readers. In November Goethe's sister Cornelia was married to Schlosser and left Strasburg. Goethe felt the loss deeply. She lived but a short time. Her married life was tortured with perpetual suffering, and she died in 1777.

The beginning of 1774 is marked by a new passion and a new work. Crespel had invented a plan for enlivening their social meetings; each man was to draw lots for a partner, and for the time to consider her as his wife. Three times Goethe drew the name of Anna Sibylla Münch, a pleasant girl of sixteen, daughter of a merchant. One of the favorite topics of the day was the trial of Beaumarchais, which ended on February 16, 1774. Immediately afterwards his *Mémoires* or pleadings were published, and from the fourth of these the play of *Clavigo* was arranged. It represents a young writer of ambition deserting the woman to whom he is engaged and breaking her heart. The fifth act, in which Clavigo kills himself, is Goethe's own. The real Clavigo died, a distinguished man of letters, in 1806. The piece was written in eight days, and published on June 1. It had a great success, and still keeps the stage. But Goethe's best friends were disappointed with it. Merck told him not to write such trash, as others could do that as well. In reality there is no period of Goethe's life in which his literary activity was so prodigious, or when he was more fully occupied with literary plans which had reference to the deepest problems of human nature. To this time belong the conceptions of *Cæsar*, *Faust*, *Mahomet*, the *Wandering Jew*, and *Prometheus*. The first was soon given up; of the second the first monologue, the dialogue between Faust and Mephistopheles, and part of the scenes with Gretchen, were now written. He has told us in his *Autobiography* what he intended to make of *Mahomet*. In five acts he was to show us how the purity of prophetic zeal is recognized by love, rejected by envy, sullied by human weakness, spiritualized by death. To write this drama he had studied the Koran through and through; only a few fragments were completed. Of the *Wandering Jew* very little remains to us. The design, conceived in Italy, of making a great work on the subject was never carried out. The *Prometheus* was completed in two acts. The monologue of *Prometheus* included in the *Lyrical Poems*, was written at the same time; but it is doubtful whether it was intended to form part of the drama. These works are to be referred to the study of the ethics of Spinoza, for whom he now began to feel a deep reverence, which continued throughout his life. The calm repose of Spinoza's mind spread over his own like a breath of peace; his systematic and well-ordered reasoning was the best antidote to Goethe's passionate waywardness. Goethe now acquired a wider view of all the relations of the moral and natural world; he felt that he had never seen the world so clearly. His time at Frankfort was also largely occupied with art. His room was covered with the works of his pencil, and a number of poems on the subject of the artist's life arose from the same influence.

*Clavigo.*

Rhine journey.

The summer of 1774 was spent in a journey to the Rhine. On July 12 Basedow, the educational reformer, came to Frankfort; three days afterwards Goethe went with him to Ems, where he found Lavater, who had been with him in the previous month. The three went down the Lahn together, and reached Coblentz on July 18. Here the famous dinner took place at which Lavater explained the secrets of the Apocalypse to a clergyman, Basedow demonstrated the uselessness of baptism to a dancing master, while Goethe, the worldling between the two prophets, made the best of his time with the fish and the chicken. They then went down the Rhine to Elberfeld, where Goethe found his old Strasburg friend Jung-Stilling, and back to Pempelfort, near Düsseldorf, the house of Fritz Jacobi, where Goethe also met Jacobi's wife Betty, his sister Charlotte, his aunt Johanna Fahlmer, and his friend W. Heinse. Their letters are full of the effect which he produced upon them. Heinse says—"I know of no man in the whole history of learning who, at such an age, was so completely full of original genius." Jacobi writes—"Goethe is the man whom my heart required; my character will now gain its proper stability: the man is complete from head to foot." Again he says that you could not be an hour with him, without seeing that it would be ridiculous to suppose that he could think or act otherwise than he really thinks and acts. No change could make him fairer or better; his nature has followed its own development, as the growth of a seed, or of a flower on a tree. Nor were these impressions evanescent. Forty years afterwards he writes of these times—"What hours! what days! I seemed to have a new soul. From that moment forth I would never leave you."

Frankfort.

Goethe returned to Frankfort at the beginning of August. The autumn brought new friends, drawn to him by the fame of the newly published *Werther*. Among these was Klopstock, twenty-five years older than Goethe, and author of the *Messiah*, the acknowledged head of German poets. On December 11 Goethe was surprised by the visit of a stranger, whom he at first took for Fr Jacobi. It was Karl Ludwig von Knebel, who was travelling with the two young princes of Saxe-Weimar, the reigning duke Karl August, then just seventeen, and his younger brother Constantine. They were on their way to France with their tutor, Count Görz, and they could not pass through Frankfort without making the acquaintance of the new genius who had risen upon their country. Goethe went to see them, was warmly received, and talked with them about the condition and prospects of Germany. This meeting decided the future course of Goethe's life. Knebel thought Goethe "the best of men, the most lovable of mankind." The princes invited him to visit them at Mainz, where they would stay longer than at Frankfort. The visit lasted from December 13 to 15, when they went on to Carlsruhe, where the duke was to meet his intended bride. Goethe took the opportunity of reconciling himself with Wieland, who lived in Weimar. On his return he found Fräulein von Klettenberg dead. "My Klettenberg is dead," he writes, "before I had an idea that she was dangerously ill. Dead and buried in my absence! She who was so dear, so much to me." Frederike was lost to him, Charlotte, Maximiliane, and his sister married. Some attachment was a necessity of his nature. He now came under the influence of Lili Schönemann, the daughter of a rich banker, whose father was dead, but whose mother conducted the business, and held one of the most brilliant salons in Frankfort. This passion seemed to be of a more lasting nature than the others. Goethe was drawn into the whirl of society. He is described as moving in brilliantly-lighted rooms, in a gold-laced coat, passing from party to concert, from concert to ball, held captive by a fair-haired girl with a pair of bright eyes. Such was Goethe in the carnival time. To Lili's influence we owe several of his smaller poems, *Neue Liebe neues Leben*, *Herz mein Herz was soll das geben*, *Heidenröslein*, and two little vaudevilles, *Erwin und Elmire* and *Claudine von Villa Bella*. The first contains some pretty songs, notably "*Das Veilchen*," set to music by Mozart. It is founded on the ballad of "Edwin and Angelina" in the *Vicar of Wakefield*. The latter half belongs to an earlier period, and is complete in itself. *Claudine von Villa Bella* has one good character the prodigal son Crugantino; and the ballad which is sung at the crisis of the plot was written during the Rhine journey with Jacobi. To this period also belongs *Stella*, a comedy for lovers, a strange wild play, full of extravagant passion. The weak-minded hero Fernando marries two wives one after the other. They meet together in an inn, and he is reduced to extremity of misery. He loves them both, and they both love him. Finally, the first wife Stella surrenders her rights, and they agree all to live together. The play in this form suggested to Canning the parody of the *Rovers, or the Double Arrangement*. In 1806 Goethe altered the close by making Fernando shoot himself and Stella take poison. It is seldom performed, but Stella is a fine character for a great actress. It is said to be founded on an occurrence in the Jacobi family.

Lili.

*Stella.*

Swiss journey.

Neither family approved of the engagement between the youthful couple. Goethe's parents thought Lili too much of a fine lady; they had a suspicion, which was well founded, that her wealth had no very sure foundation. Frau Schönemann did not think that Goethe, with all his genius, would make a good husband for her child. Cornelia Schlosser was strongly opposed to

the match. Goethe tore himself away, and went for a tour in Switzerland. His companions were the brothers Stolberg, noisy, wild young noblemen, who in May had stayed at Goethe's house. They gave Goethe's mother the name of Frau Aya, which she ever afterwards retained. On his journey Goethe visited the duke of Saxe-Weimar and his betrothed at Carlsruhe, his sister at Emmendingen, Lavater at Zurich. He bore with him the constant memory of Lili; he wore a golden heart which she had given him round his neck. He climbed the St. Gotthard on her birthday, and looked with longing eyes to the promised land of Italy. But a stronger power drew him home again, and he returned. At Strasburg he met his old friends, and saw Zimmermann, the writer on solitude. He showed him a profile of Frau von Stein who lived at Weimar, with which Goethe was enchanted.

Return. He returned to Frankfort on July 20. August was spent delightfully with Lili at Offenbach; his letters speak of nothing but her. September and the fair-time at Frankfort brought back his troubles. His position is described in the poem *Lili's Park*. He is the half-tamed bear who is held by magic bands amongst the birds and the fish, and yet secs a door left a little open for escape, and swears that he has the power to pass it. During this last period of his passion he translated part of the Song of Solomon. He wrote some scenes in *Faust*—the walk in the garden, the first conversation with Mephistopheles, the interview with the scholar, the scene in Auerbach's cellar. *Egmont* was also begun under the stimulus of the American Rebellion. A way of escaping from his embarrassments was unexpectedly opened to him. The duke of Weimar passed through Frankfort both before and after his marriage, which took place on October 3. He invited Goethe to stay at Weimar, and it was arranged that one of the duke's household, who was expected every day with a new carriage, should bring him with him. He took leave of every one, including Lili. But the carriage did not come; a second leave-taking was impossible. He remained all day in the house working at *Egmont*, going out only at night. Once he stood by Lili's window, heard her sing his songs, and saw her shadow on the curtain. He could not linger longer in the town. He started for Heidelberg hoping to meet the carriage, determined if it did not come to go on to Italy. He was summoned hastily back by a messenger, found the carriage at Frankfort, and entered Weimar in the early morning of November 7, 1775. It was not for his happiness or for Lili's that they should have married. She afterwards thanked him deeply for the firmness with which he overcame a temptation to which she would have yielded.

Weimar. At this time the smaller German courts were beginning to take an interest in German literature. Before the Seven Years' War the whole of German culture had been French. Even now German writers found but scant acceptance at Berlin or Vienna. The princes of the smaller states, shut out from the great world of politics, surrounded themselves with literature and art, and with men who would be likely to give an interest to their lives. The duke of Brunswick had made Lessing his librarian at Wolfenbüttel, and had not objected to the publication of *Emilia Galotti*. Emmerich Joseph, the worldly elector and archbishop of Mainz, was devoted to Munich and the theatre, and made his stage one of the best in Europe. The margrave of Baden had invited Klopstock to his court, and delighted to associate with himself the author of the *Messiah*, the "poet of religion and of his country." The duke of Würtemberg paid special attention to education; he promoted the views of Schubart, and founded the school in which Schiller was educated. Hanover offered a home to Zimmermann, and encouraged the development of Schlegel. Darmstadt was specially fortunate. Caroline, the wife of the landgrave, had surrounded herself with a literary circle, of which Merck was the moving spirit. She had collected and privately printed the odes of Klopstock, and her death in 1774 seemed to leave Darmstadt a desert. Her daughter Louise, the youngest of eight children, seemed to have inherited something of her mother's qualities, veiled by a serious and retiring temper. She married on October 3, 1775, the young duke of Weimar, who was just of age. She reigned over that illustrious court respected and admired, but repelled rather than attracted by its brilliancy and eccentricity. The place which she would naturally have occupied was taken by the duchess Amalia, mother of the grand duke. She was of the house of Brunswick, and after two years of marriage had been left a widow at nineteen with two sons. She committed their education to Count Görz, a prominent character in the history of the time. She afterwards summoned Wieland to instruct the elder, and Knebel to instruct the younger. The *Deutsche Merkur*, founded in 1773 to diminish the influence of the school of Klopstock, gave Weimar importance in the literary world. The duchess was a great lover of the stage, and the best play writers of Germany worked for Weimar. The palace and the theatre were burnt down in 1774, and the duchess had to content herself with amateurs. After her son's marriage she lived in the simple country houses which surround the capital, the lofty Ettersburg, the low-lying Tiefurt, the far-sceing height of Belvedere. Each of these was awakened to new life by the genius of Goethe. The duke, eighteen years of age, was simple in his tastes, a hater of etiquette and constraint, true, honest, and steadfast, fond of novelty and excitement, of great courage and activity; his impulses, rarely checked, led him rather to chivalrous enterprise than to undesirable excess. His brother, Prince Constantine, had perhaps more talent but less character than the grand-duke. He took but little part in the Weimar life, and died in 1793.

Goethe in Weimar. Upon this society Goethe, in the strength and beauty of youth, rose like a star. From the moment of his arrival he became the inseparable and indispensable companion of the grand-duke. He subdued the affections of all he met with. Wieland said that his soul was as full of him as a dewdrop of the morning sun. He was, take him all in all, the greatest, best, most noble human being that God had ever created. The first months at Weimar were spent in a wild round of pleasure. Goethe was treated as a guest. In the autumn, journeys, rides, shooting parties, in the winter, balls, masquerades, skating parties by torch-light, dancing at peasants' feasts, filled up their time. Evil reports flew about Germany; the court of Weimar had a bad name; Klopstock wrote letters of solemn advice, and forbade his young friend Stolberg to accept an appointment which the duke had offered to him. We do not know, and we need not examine, how much of these reports was true. Goethe wrote to Klopstock that if Stolberg came he would find them no worse, and perhaps even better, than he had known them before. We may believe that no decencies were disregarded except the artificial restrictions of courtly etiquette. Goethe and the duke dined together and bathed together; the duke addressed his friend by the familiar *thou*. Goethe slept in his chamber, and tended him when he was ill. In the spring he had to decide whether he would go or stay. In April the duke gave him the little garden by the side of the Ilm, with its lofty roof, in which he lived for the next eight years. In June he invested him with the title, so important to Germans, of geheim-legationsrath, with a seat and voice in the privy council, and an income of £180 a year. By accepting this he was bound to Weimar for ever. We may here mention the different grades of service through which Goethe passed. In January, 1779, he undertook the commission of war; on September 5, 1779, he became geheim-rath; in September, 1781, he received an addition to his salary of £30. This was afterwards raised by £60 more, and in 1816 he received £450, with an additional allowance for the expense of a carriage. In April, 1782, he was ennobled by the emperor, and took for his arms a silver star in an azure field; in June of the same year he became president of the chamber *ad interim*. We know that Goethe devoted himself with industry and enthusiasm to the public business; he made himself acquainted with every part of his master's territory; he did his best to develop its resources; he opened mines and disseminated education; he threw himself with vigor into the reconstruction of the tiny army. A complete account of his labors in this field cannot be known until the secrets of the Goethe house at Weimar, now hermetically closed, are opened to the curious. We shall then probably find that Goethe cannot be fairly charged with want of patriotism, or coldness to the national interest, and that his apparent indifference to the rising of 1813 must be considered in connection with his resistance to the encroachments of Austria at an earlier time.

Frau von Stein. Goethe's life was at no time complete without the influence of a noble-hearted woman. This he found in Charlotte von Stein, a lady of the

court, wife of the master of the horse. She was thirty-three years of age, mother of seven children. His letters to her extend over a period of fifty years. Until his journey to Italy he made her acquainted with every action, every thought of his mind, all the working of his brain. He calls her by every endearing epithet—the sweet entertainment of his inmost heart, the dear unconquerable source of his happiness, the sweet dream of his life, the anodyne of his sorrows, his happiness, his gold, his magnet, whom he loves in presence and absence, sleeping and waking, from whom he can never bear to be parted. Many of Goethe's writings were from this time inspired by the necessities of the court. One group of them is formed by the succession of masks or ballets which were performed to celebrate the birthday of the grand-duchess Louise. *The Four Seasons, The Procession of Laplanders, the Nine Female Virtues, The Dance of the Planets,* are sufficiently explained by their names. Others were called for by the amateur theatre, which now was forced to supply the place of the regular drama. The stage was often set in the open air, the seats cut out of turf; the side scenes, of trimmed box, still exist at Belvedere and Ettersburg. The actors were the duchess-mother and her sons, the civil servants and the officers, the ladies in waiting and the pages. Goethe was very good in comic parts; in solemn tragedy, as in his own *Orestes*, he could best interpret the dignity of the ancient stage. Musæus, head-master of the public school, was set to play low comedy; Knebel represented the dignified hero. The chief professional support of the stage was Corona Schröter, whom the duke and Goethe personally carried off from Leipsic. On this visit he saw, after a long absence, Catherine Schönkopf, Oeser, and other friends of his youth. Goethe represented most of his earlier pieces on the Weimar stage. He wrote nothing of great importance for it till the first sketch of his *Iphigenie*. But several smaller pieces owe their origin to this cause. *Proserpina* and *Die Geschwister* are melodramas; *Jery und Bätely* and *Die Fischerin* are little operas composed to suit the Weimar taste. *Scherz, List, und Rache* is an imitation of the Italian style.

Journeys.

Besides numerous visits to the court of the Thuringian princes, sojournings at Dornberg and at Ilmenau, that retired nook of the Weimar fatherland which still attracts many a pilgrim lover of Goethe, the first ten years at Weimar were interrupted by longer journeys. One of these was the winter Harz journey in December, 1777, undertaken suddenly to make the acquaintance of Plessing, a self-torturing hypochondriac, who had written to the poet for advice. With Goethe's help Plessing recovered from his melancholy, visited him at Weimar, and entertained him as professor at Duisburg on his return from the campaign in France. A visit to Dessau inspired the improvements of the park and grounds at Weimar, which now make it so attractive. The close of 1779 was occupied by a winter journey to Switzerland, undertaken with the duke and a small retinue. Two days were spent at Frankfort with Goethe's parents. Sesenheim was visited, and left with satisfaction and contentment. At Strasburg they found Lili happily married, with a new-born child. At Emmendingen Goethe stood by his sister's grave, and saw her successor Johanna Fahlmer, Jacobi's aunt. The Swiss journey began at Basel. The chief object of it was to forward the health and education of the young duke. It was a bold plan to execute in October and November. From Bern they made the tour of the Bernese Oberland. From Geneva, by the advice of De Saussure, they visited Mont Blanc and the valley of Chamouni; they crossed the Furka, not without danger, in the middle of November, descended the St. Gotthard to Lucerne, and visited Lavater at Zurich, the seal and summit of their tour. From this time Lavater lost his influence over Goethe, and in 1786 he would gladly have run away from Weimar to avoid him. In December they went by the Lake of Constance and the falls of the Rhine to Stuttgart, where, on December 14, Goethe saw Schiller for the first time. He was a student at the Academy, and in Goethe's presence received the prize.

The return to Weimar, on January 13, was the beginning of a new era. The period of genius and eccentricity was at an end; that of order and regularity succeeded. As an outward sign of the change, the duke cut off his pigtail, an example which was long without imitators. Wieland said that the Swiss winter journey was the greatest of Goethe's dramas. In the same serious mood Goethe began to write history. He chose for his subject Duke Bernhard of Saxe-Weimar, the knight-errant of the Reformation. He spent much time and trouble in collecting materials, but at length reasonably concluded that his strength lay elsewhere. At this time also he began to write *Tasso*, and adapted the *Birds* of Aristophanes to modern circumstances. His deeper thoughts were concentrated in *Wilhelm Meister*. Countess Werther, the sister of the great minister Baron von Stein, whom he visited at Neunheiligen was transferred in living portraiture to its pages. His efforts for the development of the duke's dominion naturally led him to the study of science. The opening and direction of mines induced him to study geology; the classification of ancient forms of life led him to osteology and anatomy. Goethe was always fond of children. The young Herders and Wielands spent much time in his garden, sometimes digging for Easter eggs which had been carefully concealed. In the spring of 1783 Fritz, the son of Charlotte von Stein, then ten years old, came to live with him in his garden house. In the autumn they took a journey together in the Harz. At Ilmenau was written the touching poem of that name on the duke's birthday. Goethe reviews in it their common friendship and activity as far as it has yet gone, and in a few days afterwards, as he slept in the hut on the Gickelhahn, he wrote in pencil the world-known lines in which he anticipates for himself that rest and silence which then held enchained the summits of the hills and the birds of the wood. In the following year another journey was undertaken in the Harz for the study of mineralogy. But this was only a relaxation from more serious affairs. In 1785 the Fürstenbund or league of princes was formed, under the supremacy of Frederick the Great, to resist the ambition of Austria under Joseph II. The duke of Saxe-Weimar took an important part in forming this league, and in the negotiations which preceded it. Goethe was his indispensable adviser, and must on this occasion, if not on others, have taken a keen interest in politics and in the independence of Germany.

Leaves Weimar.

The year 1786 marks an epoch in Goethe's life. He had now been ten years in Weimar, and he must have felt that his own inward development, and the work which he was most fitted to do in the world, were not advancing as favorably as they should. He had written little of first-rate importance. His *Lyrics* were of intense beauty and of deep meaning, but they were short and fugitive. He had brought with him from Frankfort the sketches of *Faust* and *Egmont*, but little had been done to them since. His occasional writings for the amateur theatre, or for court festivities, were not such as to add to his solid reputation in Germany. *Iphigenie* was the one great work of poetry which belongs entirely to this period, but that had not received its final form. *Tasso* was conceived, but only two acts were written, and these in prose. *Wilhelm Meister* is the most exact expression of this portion of Goethe's life; but loftily as it now towers above the level of his dramas, it did not then satisfy the author, nor was it in a state to be published. For the completion of these Goethe required leisure and repose, impossible to obtain in the distraction and pleasures of the court. This became more apparent to him as he set himself to collect his scattered writings. Four volumes were soon completed, but the preparation of the other four convinced him how much labor many of his poems still required for perfection. Another cause of discontent was his relation to Frau von Stein. It could not have been more intimate. She was all to Goethe and more than Gretchen, Frederike, Lili, or his sister Cornelia had been. He communicated to her every thought and every action of his life. The relation was blameless, to a character like Goethe's it was natural; but it became every year more difficult and more full of danger. The ardent devotion which sat well on the impetuosity of youth was less becoming and less possible to the man of middle age. Yet the tie could not be severed without a struggle, and the wrench could not be effected without an enforced absence. To these necessities, the need of quiet for composition, and for deliberately rearranging the circumstances of his life, was added the stress of other impulses. Goethe had all his life been fascinated by the practice of art. Indeed it was not until he had discovered at Rome the limitation of his powers that he definitely renounced the hope of becoming an artist. He tried almost every branch in turn. He drew in pencil and in sepia, sketched, painted, in oil, engraved on copper and wood, and etched. For these occupations he had but little leisure; at this time he attributed his slow improvement rather to want of labor

than to want of power. He saw infinite possibilities of advance in a life of freedom spent under the inspiration of sunny skies, and amidst the environment of the highest art.

Science. Of still deeper interest and importance were his scientific researches. In these he aspired to detect the secrets of nature; he succeeded in seeing, as in a vision, the great scheme of evolution applied to all phenomena of the natural and moral world, which the labors of many workers have revealed to us in our own day. He longed for time and leisure to perfect these ideas, to base them on solid fact. Goethe has not added much of positive value to the treasury of scientific truth, but he deserves the credit of having discerned the right method of inquiry when it was obscure to many, and of having thrown that glow of imagination over dry and technical inquiry, without which no great discoveries can be made. His inquiries into the nature of light belong to a later time. He began with physiognomy under the auspices of Lavater. From this he was led to the study of anatomy, and especially to the comparison of the skeletons of men and animals. In this department he made a real discovery, that the intermaxillary bone which exists in the lower animals is found in the human subject in a rudimentary state,—that it is seen distinctly in youth, but as years advance is united with the body of the skull. The discovery that the skull itself is only a development of the vertebræ of the spine was made a little later. He was led to this further step by picking up the head of a sheep on the shore of the Lido at Venice. The care of his garden cottage naturally led him to the study of plants. He soon found himself attracted to wide and comprehensive generalizations. The *Metamorphoses of Plants* was not published till 1790, but the idea which had possession of his mind was a solid contribution to the science of botany. Goethe sought to discover an original or standard flower, from which, as from a Platonic ideal type, all existing flowers were deflexions and aberrations. In this he followed an unscientific method, but he clearly saw that all the different parts of the plant, except the stem and the root, might be regarded as modifications of the leaf; that leaf, calyx, corolla, bud, pistil, and stamen were all referable to the same type; and that whether a plant produced leaves, or flowers, or fruit, depended on the differentiation of the nutrition which it received. Less fortunate were his speculations in geology, to which he devoted a very large portion of his time and thoughts. It is something that he recognized the importance and reality of that science, then in its infancy, which has had to undergo more than its due share of obloquy and distrust. But he was of necessity a follower of Werner, who based his classification of rocks rather on the minerals which they contained than upon an examination of the fossil remains of organic life. All these causes contributed together to one end. His desire to complete the great poetical works which he had begun, to disentangle his life from the complexities which had entwined themselves around it, to give a fair trial to his impulses towards art, to afford opportunity for the careful and systematic interrogation of nature, and, above all, a longing to possess his soul in peace, and solemnly to probe in silence the depths of his own being, conspired together to drive him from Weimar to the land which he had yearned after from boyhood. The resolution, slowly formed, was boldly executed. In the summer of 1785 he had visited Carlsbad for the first time, passed a pleasant month in the company of the duchess Louise, Herder, and Frau von Stein. In July, 1786, he paid it a second visit. After five weeks of brilliant society, very favorable to his health, spent in revising his works for the press, he stole secretly away. The duke alone knew that he designed an absence of some duration. In the strictest incognito, in the guise of a German merchant, he drove alone to the land of the citron and the orange.

Italy. Goethe's Italian journey, the most momentous epoch in the development of his intellectual life, lasted from September 3, 1786, to June 18, 1788. Assuming the common German name of Müller, in the strictest incognito he journeyed by way of Munich, where he studied the picture gallery and the collection of antiquities; by the Lake of Garda, where he began his metrical version of the *Iphigenie;* by Verona, where he saw the first specimen of Roman building in Italy in the stupendous amphitheatre; by Vicenza, where he was attracted by the grace and harmony of the classical Palladio; by Padua, where he neglected the frescoes of Giotto, but rose to a clear conception of the form of the *original plant* by the marks on the leaves of a palm in the botanical garden; to Venice, where for the first time he was able to taste the charm and richness of southern life. As he proceeded further, Ferrara spoke to him of Tasso; Bologna showed him the great masters of the academic school who have now grown pale and dim before the predecessors of Raphael; Florence interested him a little; Assisi drew his attention, not to the triple church of Saint Francis, the unrivalled museum of religious art, but to the little ruined temple which no modern traveller would notice but for the name of Goethe; Spoleto again delighted him with the remains of ancient architecture. He reached Rome on October 28. His first stay was till February. The constant companion of his studies was the painter Tischbein, who helped him to disentangle the many difficulties of the old Rome and the new. He lived chiefly among the German artists and men of letters who frequented the caffé Greco. Among these were Angelica Kaufmann and Moritz, who deepened his knowledge of German versification, and prepared him for the composition of *Iphigenie.* Although Goethe occupied himself chiefly with drawing, he was able to announce on June 6 that this work was finished. The second *Iphigenie*, written in verse, was the first important fruit of the Italian journey. It is in very strong contrast with *Götz von Berlichingen.* It is written in the strictest classical form. Although based on the *Iphigenia in Tauris* of Euripides, it has little in common with it. In Euripides Thoas is represented as a cruel barbarian, against whom it is justifiable to employ every artifice of fraud or violence. In Goethe the characters are ennobled by a higher principle, and the struggle between truth and falsehood is made a prominent motive of the piece. When Thoas discovers that, according to the oracle of Apollo, the return of Orestes's sister to Greece will satisfy the anger of the gods, he gives his consent, and his last words are a friendly farewell. Towards the end of February Goethe left Rome for Naples. Here he was attracted less by the remains of antiquity, even the new revelations of Herculaneum and Pompeii, than by the prospects of nature, the bay, the islands, the volcano, the thousand beauties which make the gulf unrivalled in the world, and by the multitudinous and teeming life which throngs the endless quays that line the shore. Sorrento stimulated him to the revisal of *Torquato Tasso,* but he did not complete the drama till his return from Italy. It did not appear in print till the spring of 1790. The play had a special fascination for him as a picture of his own distracted life. He could depict with feeling the struggle between the actual and the ideal, the ill-assortment of a passionate poet with the jealous and artificial environment of a court. At the end of March Goethe sailed to Sicily; rolled up in his cloak he meditated the composition of his *Tasso.* Sicily struck him, as it must strike all travellers who have studied the ancient world, as a revelation of Greece. It is, if one may say so, more Greek than Greece itself. Its mountains, streams, trees, flowers, the form of its boats and pottery, the habits of the people, the quivering smile of the bright blue sea fringed with golden sand, represent completely the Greece of the *Odyssey* and of the choruses of Euripides. Goethe was overmastered by this powerful influence. He sketched and began *Nausicaa,* the story of the *Odyssey* in dramatic form, which always remained a fragment. He returned to Rome in June. The rest of the year was spent in the city and its neighborhood, in the serious study of drawing, for which unfortunately he had but little talent, and in the composition of *Egmont,* a work begun with the approval of his father in the early Frankfort days. It was finished in September, 1787, and appeared in the Easter of the following year. Although *Egmont* still keeps the stage, it has very grave faults. It is an unfortunate mixture of the natural and ideal treatment. The license with which the scenes are transposed in modern performances shows how much the work lacks symmetry and cohesion. Schiller criticised it severely as being untrue to history. He described the close, where all difficulties are solved by the appearance of Clärchen, as a *deus ex machina* or a *salto mortale* into the world of opera. The music of Beethoven has contributed to it a charm of art which was necessary to its completeness. Besides this, Goethe rewrote for publication his early vaudevilles of *Erwin und Elmire* and *Claudine von*

Rome.

Tasso.

Sicily.

Egmont.

*Villa Bella.* The carnival of 1788 was of importance to his experience. He wrote some scenes of *Faust:* especially the scene in the witches' kitchen was composed in the Borghese gardens. At the end of April he took a sad farewell of Italy, and arrived at Weimar in the middle of June.

Return to Weimar.

From this time his life takes a new color. He had learned in Italy not only new principles of art—not only that a work of art, whatever of Gothic ornament it may possess, must be solid, firm, and simple in its construction as a Grecian temple—but he had also learned that life itself should be a work of art. He was determined henceforth to be himself, to break the bonds which had confined him and the distractions which had confused him, to possess his soul sacred and inviolable for the purposes of his life. He was relieved of the presidency of the chamber and of the war commission, but in a manner which did him the greatest honor. His relations with Frau von Stein, which had been one reason of his leaving Weimar, began to cool. One of their last friendly meetings was in a journey to Rudolstadt, where Goethe met Schiller. Neither knew the influence which the other would have upon his life. Their relations were those of shyness, and partly even of dislike. Goethe's friendship with Frau von Stein was to receive a final blow. In the autumn of 1788, walking aimlessly through the park, he met Christiane Vulpius, a young girl who presented him with a petition in favor of her brother. She had golden curling locks, round cheeks, laughing eyes, a neatly rounded figure; she looked, as has been said, "like a young Dionysus." Goethe took her into his house, and she became his wife in conscience, and the mother of his children. He did not marry her till 1806, when the terrors of the French occupation made him anxious for the position of his eldest son. She had but little education, and he could not take her into society; but she made him a good and loving wife, and her quick mother-wit made her available as an intellectual companion. To these days of early married life belong the Roman elegies, which, although Italian and pagan in form, in color, and in sensuality, were written in Germany from home experiences.

Christiane Vulpius.

Campaigns.

We must pass rapidly over the next six years, until Goethe's genius received a new impulse and direction by his friendship with Schiller. In the spring of 1790 he travelled to Venice to meet the duchess Amalia. The Venetian epigrams, still more outspoken in sensuality than the Roman, were the fruit of this journey. In the autumn of the same year he accompanied the duke to Silesia, the first of those military journeys which strike so discordant a note in the harmonious tenor of his existence. The year 1791 offered a quiet contrast to the movement of the year before. He began to take a more special interest in the university at Jena, in which his young friend Fritz von Stein had now entered as a student, and his time was more and more occupied with the study of colors, the least happy and successful of his scientific labors. In the autumn of 1791 Goethe was able to devote himself regularly to a task which had informally occupied his first years in Weimar. The new theatre was completed, and Goethe was made director of it. It was in this capacity that he was best known to the citizens of Weimar. He had the final decision on every detail of piece, scenery, and acting; in later years his seat was in a large arm-chair in the middle of the pit, and applause was scarcely permitted until he gave the signal for it. The German stage owes perhaps as much to Goethe as to Lessing. The *répertoire* of the Weimar theatre was stocked with pieces of solid merit which long held their place. Shakespeare was seriously performed, and the actors were instructed in the delivery of blank verse. Stress was laid on the excellence of the *ensemble* as against the predominance of particular stars. The theatre was considered as a school not only of elevating amusement but of national culture. Goethe wrote the *Gross Cophta* for the Weimar stage, a piece founded on the history of Cagliostro and the diamond necklace. He was fascinated by the story as a foreboding of the coming horrors of the Revolution. In these events he was destined to take a more active part than he expected. In August, 1792, he accompanied the duke to the campaign in the Ardennes. Passing by Frankfort, where he visited his mother, he joined the allied armies at Longwy. He beguiled the tedious siege of Verdun by writing an account of his theory of colors in a leaky tent; and on the disastrous day of Valmy, which he recognized as the birth of a new era, he sought the thickest of the fight that he might experience the dangerous rapture of the cannon-fever. He retreated with the Prussian army, spent five weeks with his friend Jacobi at Pempelfort, and on his return to Weimar at the end of the year found that the duke had built him a spacious house in the square where the joint statues of Goethe and Schiller now stand, in eternal memory of their friendship. In 1793 he went with his master to the siege of Mainz. He continued his optical studies during the bombardment, witnessed the marching out of the garrison, and was one of the first to enter the conquered town. He received leave to withdraw, and went to his mother at Frankfort, and persuaded her to sell the old house and its contents, and to provide a more convenient home for her old age. There was some talk of her coming to Weimar. In the autumn of this year the duke left the Prussian service, and Goethe could look forward to a period of peace. He was chiefly occupied with the management of the theatre, and for this he wrote two pieces, both of which had reference to the politics of the time. The *Bürgergeneral* is a satire on the Revolution, and was long a stone of offence to Goethe's friends, who thought that he should have hailed with delight the birth of a new era. The *Aufgeregten*, left unfinished, sketched the outbreak of the Revolution in a country town, and would have declared the author's views with greater distinctness. But the feelings of scorn and contempt which he felt for the cowardice, cunning, and perfidy of mankind were expressed in a work of greater magnitude. He had good reason to deplore the misery of the time. His mother's home in Frankfort was broken up; Schlosser, his brother-in-law, had retired to Auerbach; Jacobi was flying to Holstein. Goethe took the old German epic of *Reynard the Fox*, with which he had long been familiar, and which, under the guise of animals, represents the conflicting passions of men, and rewrote it in flowing German hexameters.

Thus far he had produced but little since his return from Italy. He was now to undergo the most powerful influence which had as yet affected his life. His friendship with Schiller was now to begin, an alliance which, in the closeness of its intimacy and its deep effect on the character of both friends, has scarcely a parallel in literary history. If Schiller was not at this time at the height of his reputation, he had written many of the works which have made his name famous. He was ten years younger than Goethe. The *Räuber* plays the same part in his literary history as *Götz* plays in that of Goethe. This had been followed by *Fiesco* and *Kabale und Liebe.* The second period of Schiller's life had begun with his friendship with Körner, and his residence in Saxony. Here he wrote the *Hymn of Joy*, and completed *Don Carlos.* In 1787 he settled at Weimar. He found the place deserted, the duke in the Prussian camp, Goethe in Italy. He applyed himself to history, wrote the *Revolt of the Netherlands*, and studied the literature and art of Greece. In 1789, mainly upon Goethe's recommendation, he was made professor of history at the university of Jena, although he was afraid lest the scholars should discover that they knew more history than the teacher. He made a successful marriage, and worked seriously at his *History of the Thirty Years' War.* In 1794 Schiller had arranged with the publisher, Cotta of Augsburg, whose name is from this time indissolubly connected with the history of German literature, for the production of a new literary journal. It was to be called the *Horen*, and the most distinguished German writers were to contribute to it. Goethe accepted the invitation willingly. The work was designed to mark an epoch in German taste, and it did so. It soon had two thousand subscribers. Among those who promised to contribute were not only Matthisson, Herder, Knebel, Fritz Jacobi, and Gleim, but the brothers Humboldt, the veteran Kant, the youthful Fichte, who had just begun to lecture in Jena, and, at a later period, the brothers Schlegel. Schiller opened the first number of the journal with his letters on the "Æsthetic Education of the Human Race." Goethe contributed the "Unterhaltungen deutscher Ausgewanderten," a series of stories told by a number of German emigrants who had been driven to cross the Rhine by the invasion of the French. The most remarkable of these stories is the "Märchen," a wild and mystic tale, which has been the subject of as much controversy and of as many interpretations as the second part of *Faust.* Goethe also published in the *Horen* the "Römische Elegien," the flavor of which even Karl August found a little too strong. The

Friendship with Schiller.

first effect of Schiller's influence on Goethe was the completion of *Wilhelm Meisters Lehrjahre*. He had conceived the plan of the work twenty years before, and the first six books had been written before the Italian journey. It was now finished by the addition of two more books. It stands in the first rank of Goethe's writings. He has aimed in it to attain to perfect objectivity of tone, to represent men as they are, and to pass no judgment upon them. The hero passes with weak irresolution through a number of ordinary circumstances, apparently the sport of fortune and the plaything of chance, yet all these experiences have their definite result in the training of his character. Like the son of Kish, he goes forth to seek his father's asses and finds a kingdom. The unearthly charm of the child Mignon, the dark fate which shrouds the aged harper like the doom of Œdipus, the uncertain yearning after a happier home in brighter climes, give a deeper undertone to the prevailing lightness of the story. The style is exquisitely soft and flowing. It has the sweetness and simplicity of *Werther* but is more mellow and more mature. The sixth book is occupied with the *Bekentnisse einer schönen Seele*, a piece of the autobiography of Goethe's early friend Fräulein von Klettenberg, altered to suit its new surroundings. The *Musen Almanach* for 1796, edited by Schiller, was enriched by some of Goethe's most exquisite poems—*Die Nahe des Geliebten*, *Meeres Stille*, and *Glückliche Fahrt*. The storm of criticism which was aroused by the *Horen*, and the little success which, after the first numbers, it met with from the public, determined the two friends to retaliate upon their aggressors. The poems of Martial contain a number of epigrams written in two lines, describing the numberless little presents or *xenia*, which it was customary for friends to exchange at Rome during the time of the Saturnalia. The name was borrowed by the two poets, and the *Xenien* was a convenient vehicle for the expression of their opinion on every subject. The newspapers of the day were the first object of attack, but they soon went farther afield. The epigrams were written in Schiller's rooms at Jena. It is impossible to fix the authorship of the *Xenien;* one conceived the idea, the other wrote the lines; one wrote the hexameter, the other the pentameter; they intended the authorship as well as the ownership of the copyright to be one and indivisible. Notwithstanding this, the collection has been broken up. There is no guarantee that the epigrams which appear in the separate works of either poet were really written by the authors to whom they are ascribed: some are reprinted in the works of both; some have remained unprinted altogether. They appeared in the *Musen Almanach* for 1797, together with the Venetian elegies mentioned above. It is needless to say that they roused the writers whom they attacked to unspeakable fury, and were the occasion of a copious literature. A more solid result of the friendship between the poets was the production of *Hermann und Dorothea*. It is a German idyl; the story is taken from the sufferings of Lutherans driven out in the early part of the 18th century from the province of Salzburg, but Goethe has given it the character of his own time. He had seen much of the suffering produced by the French Revolution, and he wished this poem to be a reflexion in a tiny mirror of the storms and convulsions of the great world. In its literary form it is a descendant of Voss's *Luise*. It was conceived at Ilmenau in August, 1796, and finished in the following spring. Schiller tells us how it was composed with extraordinary ease and rapidity. During nine days Goethe produced 150 lines a day. You have only to shake the tree, as Schiller said, and ripe apples will tumble down about you. The lines thus hastily written underwent a careful revision. Contemporaneous with *Hermann und Dorothea* is the production of *Wallensteins Lager* by Schiller, which was written with the advice and assistance of his brother poet. The completion of this cycle of plays falls two years later.

*Wilhelm Meister.*

*Xenien.*

*Hermann und Dorothea.*

Ballads. The year 1797 is the year of ballads. In his garden house at Jena Schiller worked diligently at this vein, that perhaps for which he was best suited, and in which he most nearly rivals Goethe. Goethe wrote *Die Braut von Korinth*, *Gott und die Bayadere*, and *Der Zauberlehrling;* and the whole collection was published in the *Musen Almanach* for 1798. The latter half of this year was occupied with a tour in Switzerland. Before its commencement he visited his mother at Frankfort for the last time, and presented to her his wife and his son. It was a year of extraordinary activity. Besides the ballads and his researches in the morphology of plants and insects, he translated a great part of the autobiography of Benvenuto Cellini, wrote a number of essays on the question of æsthetics, and worked at his long neglected *Faust*. Of this he wrote the dedication, the "Prologue in Heaven," and the "Golden Marriage of Oberon and Titania"—so powerful was the effect of intellectual sympathy and stimulus. The six years which succeeded Goethe's return from his third Swiss tour, although they embrace the period in which he and Schiller were in daily co-operation, have left us little of permanent worth from the older poet. On the other hand, they are the years of Schiller's greatest activity. The great trilogy of *Wallenstein*, perhaps the highest point of Schiller's genius, was followed by *Maria Stuart*, the *Jungfrau von Orleans*, the *Braut von Messina*, and *Wilhelm Tell*. From the end of 1799 Schiller was permanently settled in Weimar; a dramatic school was founded, and the representation of these classical dramas was the glory of the Weimar stage. During these years Goethe was occupied with *Faust*, with his researches into the theory of colors and of biological development, with the conduct of the theatre and the practical encouragement of art. In 1798 the *Horen* died a natural death, and was succeeded by the *Propyläen*, a journal of literature and criticism, which, although it contained many essays by Goethe, never exceeded a circulation of 300. In the spring of 1799 the study of Homer incited Goethe to sketch a long epic poem on the subject of Achilles. Schiller did his best to encourage the work. The first canto was rapidly completed, but it had no successor. Goethe contented himself with translating the works of others, and prepared the *Mahomet* and *Tancred* of Voltaire for the Leipsic stage. In the first days of the new century he suffered a dangerous attack of scarlatina. His friends feared for his life. Frau von Stein recalled her forgotten friendship, and showed kindness to his son. After his recovery he sketched out what was the most important work of these years, a trilogy on the subject of the French Revolution; of this only the first part, the *Natürliche Tochter*, was completed. The story was a true one of a princess of the French house of Conti. The play is written with the full beauty of Goethe's style, and some passages and effects are worthy of his highest genius. But as a whole it fails. It has the quality, which in a drama must be a fault, so characteristic of Goethe's later writing, of too great universality of treatment. The characters are not living beings but abstractions, and the language is vague and general rather than clear and defined. The play was performed at Weimar on April 2, 1803. Two masterpieces of Schiller—the *Braut von Messina* and the *Jungfrau von Orleans*—preceded and followed it by a few weeks. At the end of this year Madame de Stael arrived in Weimar accompanied by Benjamin Constant. She had heard of the fame of this new Parnassus, and she was bent on proclaiming the intellectual superiority of Germany to the world. Goethe at first fled from her, as Byron did at a later period. He hid himself in Jena, but was recalled by order of the duke. The result of the conversations in the salons of Weimar is contained in her book *De l'Allemagne*. In March she was suddenly recalled by the death of her father, the minister Necker. Goethe was at this time the centre to which the most distinguished men of all kinds in Germany naturally turned. He was most intimate with Zelter the musician, with whom he maintained a full correspondence; with Wilhelm von Humboldt, the statesman-scholar; with F. A. Wolf, the founder of the science of philology; with Gottfried Hermann, the best authority on Greek metres. But the friendship which was worth all these was soon to be severed. In the beginning of 1805 Goethe was convinced that either he or Schiller would die in that year. In January they were both seized with illness; Schiller had finished his *Phädra* and begun to work at his *Demetrius*. Goethe was translating the *Neveu de Rameau* of Diderot. Schiller was the first to recover, and visiting Goethe in his sick room, fell on his neck and kissed him with intense emotion. On April 29 they saw each other for the last time. Schiller was on his way to the theatre whither Goethe was too ill to accompany him. They parted at the door of Schiller's house. Schiller died on the evening of the 9th of May. No one dared to tell Goethe the sad news, but he saw in the faces of those who surrounded him that Schiller must be very ill. On the morrow of

Madame de Stael.

Schiller's death.

Schiller's death, when his wife entered his room, he said, "Is it not true that Schiller was very ill yesterday?" She began to sob. He then cried, "He is dead!" "Thou hast spoken it thyself," she answered. Once more he cried, "He is dead!" and turning aside covered his weeping eyes with his hands. He at first intended to have completed *Demetrius* as a memorial of his friend, but a happier inspiration was to arrange a performance of Schiller's great poem of *The Bell*, and to crown it by an epilogue. Since that time Schiller and Goethe have been inseparable in the minds of their countrymen, and have reigned as twin stars in the literary firmament. If Schiller does not hold the first place, it is at least true that he is more beloved, although Goethe may be more admired. It would be invidious to separate them. But it is evident that the best fruits of Schiller's muse were produced when he was most closely under Goethe's influence, and the foreign student of German culture has ground for believing that at some future time the glory of the lesser luminary will be absorbed in that of the greater, and the name of Goethe will represent alone and unrivalled the literature of his age and country.

Napoleon.

Schiller was happy in the occasion of his death. He did not see the troubles which immediately afterwards burst upon Thuringia. On October 14, 1806, the battle of Jena was fought. The court had fled from Weimar; only the duchess Louise remained. In the evening of the defeat Weimar was plundered by the conquering troops. Many of Goethe's friends lost everything they possessed. His property and perhaps his life was saved by the firmness of Christiane, and afterwards by the billeting of Marshal Augereau in his house. On the 15th Napoleon entered the town, but Goethe did not go to see him. The duchess obtained her husband's pardon by her entreaties. It was not till the autumn of 1808 that Napoleon and Goethe, perhaps the two greatest men then living in Europe, met and conversed. It was at the congress of Erfurt, where the sovereigns and princes of Europe were assembled. Goethe's presence was commanded by the duke. He was attracted at least as much by the prospect of seeing Talma as of meeting Napoleon. He was invited to an audience on October 2; Talleyrand, Berthier, and Savary were present. The emperor sat at a large round table eating his breakfast. He beckoned Goethe to approach him, and said to him, "Vous êtes un homme!" He asked how old he was, expressed his wonder at the freshness of his appearance, said that he had read *Werther* through seven times, and made some acute remarks on the management of the plot. Then, after an interruption, he said that tragedy ought to be the school of kings and peoples; that there was no subject worthier of treatment than the death of Cæsar, which Voltaire had treated insufficiently. A great poet would have given prominence to Cæsar's plans for the regeneration of the world, and shown what a loss mankind had suffered by his murder. He invited Goethe to Paris; that was the centre of great movements; there he would find subjects worthy of his skill. They parted with mutual admiration. The bust of Napoleon was a prominent ornament in Goethe's study.

*Faust.*

In the same year, 1808, an edition of Goethe's works in thirteen volumes was published by Cotta at Tübingen. It is remarkable as containing the first part of *Faust* in its complete form. The principal portions of the drama had already been published as a fragment in 1790. It had then attracted but little attention. Heyne wrote of it—"There are fine passages in it, but with them there are such things as only he could give to the world who takes other men to be blockheads." Wieland and Schiller were apparently dissatisfied with it. It had perhaps the appearance of patchwork, as it was made up of fragments which had been written at very different periods of his life. The idea of writing *Faust* seems to have come to Goethe in his earliest manhood. He was brooding over it at the same time with *Götz von Berlichingen*, but at Strasburg he spoke to Herder of neither. He apparently began to write it down at the same time as *Werther* in 1774, and we find mention of its progress in the two following years; indeed, all the important parts of the fragment which appeared in 1790 were known to Jacobi before 1776. He took the work with him to Italy, where he added little to it except the scene in the witches' kitchen. The dedication, the "Prologue in Heaven," which presents to the reader the idea of the whole work, the prelude on the stage, copied from the Indian drama, the lyrical intermezzo, the scene with Wagner before the city gate, and the scene with Mephistopheles in the study were written before 1800. In that year he was busy with Helena for the second part, and he added nothing afterwards to the first except the "Walpurgis Night" and the scene of Valentine's death. *Faust* justly stands at the head of all Goethe's works, and it deserves a very high place among the best works of every age. Founded on a well-known popular tale, indebted for its interest and pathos to incidents of universal experience, it deals with the deepest problems which can engage the mind of man. In this combination of qualities it is perhaps superior to any one of Shakespeare's plays. The plot is as simple and as well known to the audience as the plot of a Greek tragedy. The innocence and the fall of Gretchen appeal to every heart; the inward struggles of Faust, like those of Hamlet, and the antagonism of the sensual and moral principles interest the reader just in proportion as his own mind and nature have been similarly stirred. Each line is made to stand for eternity; not a word is thrown away; the poem has entered as a whole into the mind and thought of modern Germany; nearly every expression has become a household word. Characters are sketched in a single scene; Valentine lives for us as clearly as Faust himself. Deeper meanings are opened up at every reading, and the next age will discover much in it which is concealed from this. Goethe, writing of *Faust* in his eightieth year, says, with truth, "The commendation which the poem has received far and near may be perhaps owing to this quality, that it permanently preserves the period of development of a human soul which is tormented by all that afflicts mankind, shaken also by all that disturbs it, repelled by all that it finds repellent, and made happy by all that it desires. The author is at present far removed from such conditions; the world likewise has to some extent other struggles to undergo; nevertheless the state of man, in joy and sorrow, remains very much the same, and the latest born will still find cause to acquaint himself with what has been enjoyed and suffered before him in order to adapt himself to that which awaits him."

*Wahlverwandtschaften.*

In 1809 he finished *Die Wahlverwandtschaften* (The Elective Affinities), a story which is always cited to prove the immoral tendency of his works. A married couple, Edward and Charlotte, are thrown into constant companionship with two unmarried persons, the Captain and Ottilie. A cross attraction takes place similar to that which is often seen in chemical experiments. Edward unites himself with Ottilie, Charlotte with the Captain. The psychological changes by which this result is produced are portrayed with a masterly hand. The moral may be held by some to exalt the preponderance of fatality in human affairs, and the uselessness of contending against irresistible circumstances. Others may believe that the story is intended to show the disastrous calamities which may be wrought by a weak and self-indulgent will. Ottilie, though she cannot resist her passion, has strength enough to starve herself to death; Edward is the prototype of Arthur Donnithorne and Tito Melema. The work is replete with earnest purpose and terrible warning.

*Farbenlehre.*

In 1810 Goethe finished the printing of his *Farbenlehre* (Theory of Colors), a work which had occupied his mind ever since his journey to Italy. His theories were rejected and disregarded by his contemporaries, but he left them with confidence to the judgment of posterity. Goethe's labors in this domain fall into two natural divisions—one in which he tries to prove that the hypotheses of Newton are unsatisfactory, and another in which he promulgates a theory of his own. In his first work, published in 1791 and 1792, he describes with great accuracy and liveliness the experiments which he has made. They consist chiefly of the appearances presented by white discs on a black ground, black discs on a white ground, and colored discs on a black or white ground when seen through a prism. There are two points which he considers fatal to Newton's theory,—that the centre of a broad white surface remains white when seen through a prism, and that even a black streak on a white ground can be entirely decomposed into colors. The scientific friends to whom he communicated these observations assured him that there was nothing in them opposed to Newton's theory,—that they were even confirmations of it. He would not be convinced, and took no pains to acquire that exact knowledge of mathematics and geo-

metrical reasoning without which the more abstruse problems of physical optics could not be intelligible. He went on further to formulate a theory of his own. His views on the subject are contained in their shortest form in a letter addressed to Jacobi from the camp at Marienburg in July, 1793. They are divided into six heads, of which the following is an abstract. (1.) Light is the simplest matter we have knowledge of, the least capable of analysis, the most homogeneous. It is not a compound body. (2.) Least of all is it compounded of colored lights. Every colored light is darker than colorless light. Brightness cannot be compounded of darkness. (3.) Inflexion, refraction, reflexion, are three conditions under which we often observe apparent colors, but they are rather occasions for their appearance than the cause of it. (4.) There are only two pure colors, blue and yellow; red may be regarded as a property of both of them. There are two mixed colors, green and purple; the rest are gradations of these colors, and are not pure. (5.) Colorless light cannot be produced out of colored lights, nor white from colored pigments. (6.) The colors which appear to us arise solely out of a modification of the light. The colors are excited in the light, not developed out of the light. These views he afterwards extended and explained, but very slightly modified. In Goethe's opinion, yellow was light seen through a thickened medium; blue was darkness seen through an illuminated medium; all other colors were derived from these two. The theory of the *Farbenlehre* has not yet received the recognition which Goethe anticipated for it. In his own day he had some adherents,—the most distinguished perhaps was the philosopher Hegel, whose views, however, of natural philosophy have caused many inquirers to recoil from his theory of metaphysics. Goethe complained that no physicist believed in him, and as that is still true in an age which has been devoted more than any other to physical inquiries, we may conclude that the principle upon which his theories are based is radically wrong.

The year 1809, in which *Die Wahlverwandtschaften* was written, was for Goethe the beginning of a new era. He was then fresher and brighter than he had been for ten years before. He had lived through a troubled period of oppressive sorrow. The death of Schiller, the violation of his beloved Weimar, the deaths of the duchess Amalia and of his mother, his own bodily and mental sufferings, had given a tone of sadness to his poetry. As if to put the finishing stroke to the efforts of his life, he married the mother of his children, arranged and published his collected works, and completed his theory of colors. The unfinished drama of *Pandora* is a symbol of this time. The part which is completed refers only to past experiences of sadness; the continuation was to have lifted the curtain of future hope.

It was natural at the beginning of a new course of life that Goethe should write an account of his past existence. The study of his collected poems made it apparent to him how necessary it was to furnish a key by which they might be understood. These various causes led to the composition of *Dichtung und Wahrheit* (Poetry and Truth) an autobiographical history of the poet's life from his birth till his settlement at Weimar. This work is the cause of much embarrassment to the poet's biographers. Where it ought to be the most trustworthy source of information, it is most misleading. It is probable that Goethe intended it to be an accurate and circumstantial account of his life. But the inner life of an individual is more clear to him than the outer. The stages of our self-development are better remembered than the exact circumstances which produced them, still less than the order of time in which they followed each other. Goethe took pains to ascertain facts which he had forgotten. But he was so conscious that imagination would play a large part in the composition that in the title he gave poetry the precedence before truth. The indefatigable industry of German investigation has laid open before us every detail of the poet's life and every phase of his feeling. *Dichtung und Wahrheit*, if it has lost its rank as a history, still keeps its place as a classic. The simple loving delineation of the childhood of genius is as fresh as ever, and is of more universal interest from being less particular. The first five books of this autobiography appeared in 1811, the next five in 1812, the third instalment at Easter, 1814, and the conclusion after Goethe's death. The period during which

*Autobiography.*

this was his principal work witnessed the greatest political event of the first half of our century, the rising of the German people against the power of Napoleon. In this Goethe took no share, and with it he apparently felt little sympathy. He made no impassioned orations to his countrymen like Fichte; he wrote no inspiring lays like Körner. The ballads which he composed in 1813 are harmless enough,—*Der wandelnde Glocke, Der getreue Eckhart, Der Todtentanz.* He saw Stein and Arndt at Dresden in 1813, but disappointed them by his impassive manner. He said to Körner's father at the same time, "Yes, shake your chains! The man is too great for you. You will not break them, but only drive them deeper into your flesh." The reasons for this apparent coldness are perhaps more simple than they appear at first sight. Goethe was a man of thought rather than of action. Although a fair portion of his long life was given to the practical business of his adopted country, his heart was always in speculation or artistic production. While inspecting mines he was spinning theories of geological formation; while working for the war commission he gladly ran away to the castle of Dornburg to bury himself amongst his deserted papers. The pressure of court business at Weimar drove him to the solitude of Italy. In the defiles of the Argonne, and in the trenches before Mainz, he was scheming and arranging his theory of colors. A bombardment was valued by him less as an attack upon the enemy than as a series of interesting experiments in optics. Added to this natural indifference to the details of human affairs was his belief in the predominance of force, and in the necessary evolution of the history of the world. Napoleon was to him the greatest living depository of power. Nations, whether conquered or victorious, separated or united, obeyed a common law against which individual will strove in vain. Goethe was thus incapacitated for politics, both by his qualities and his defects. This habit of abstract contemplation grew upon him in later life. Those who condemn him on this ground should remember that he hailed in no grudging spirit the formation of a united Germany, and that his works have been the most potent agency in making all Germans feel that they are one. Few would wish to exchange the self-conflict of *Faust*, or even the wayward wanderings of *Meister*, for the hectic extravagance of Körner or the unsubstantial rhetoric of Posa.

*The war of liberation.*

It was hardly to be expected that at the age of sixty-five Goethe should strike out new lines of poetical activity. However, in the *West-östliche Divan*, he made the first attempt to transplant Eastern poetry to a German soil, and set an example which has been followed by Heine and Mirza Schaffy. In 1811 he first became acquainted with the works of Hafiz in Hammer's translation. At a time when North and South and West were splitting in sunder, when thrones were breaking up and empires trembling, he sought a willing refuge in the restoring fountain of the Eastern poet. The book *Timur* has an obvious reference to the expedition of Napoleon in Russia, but the large majority of the poems are amatory, and are addressed to an imaginary Suleika, whose name is given to one of the books. Once more in his old age Goethe came under the sovereignty of a woman. She was Marianne von Willemer, the newly married wife of a Frankfort banker, Jacob von Willemer, who was an old friend of Goethe's and of his brother-in-law Schlosser. Goethe made her acquaintance in a journey which he took in the Rhine country with Sulpiz Boisserée, who had succeeded in interesting Goethe in early German art, a subject to which he was himself devoted. The correspondence between Goethe and Marianne was published in 1877. It extends almost to the day of his death, and includes letters from Eckermann giving an account of his last moments. Not only were most of the *Divan* poems addressed to Suleika, but several of those included in the collection are by Marianne herself, and will bear comparison with those of Goethe. In these poems the Oriental form is not very strictly observed. The fondness of the Orientals for the repetition of single rhymes is not attended to, and if sometimes remembered is soon forgotten. Their Eastern color depends rather on the suggestion of Eastern scenery and the introduction of Eastern names. This, however, gives the poet a greater license to levity, to fatalism, and to passion than would have been possible in poems of a purely German character.

*West-östliche Divan.*

The last twelve years of Goethe's life, when he had passed his seventieth birthday, were occupied by his criti-

The closing years.

cisms on the literature of foreign countries, by the *Wanderjahre*, and the second part of *Faust*. He was the literary dictator of Germany and of Europe. He took but little interest in the direction in which the younger German school was moving, and was driven to turn his eyes abroad. He conceived an intense admiration for Byron, which was increased by his early death. Byron appears as Euphorion in the second part of *Faust*. He also recognized the greatness of Scott, and was one of the first to send a greeting to the Italian Mazzini. He conceived the idea of a world-literature transcending the narrow limits of race and country, which should unite all nations in harmony of feeling and aspiration. German writers claim that his design has been realized, and the literature of every age and country can be studied in a tongue which Goethe had made rich, flexible, and serviceable for the purpose. The *Wanderjahre*, although it contains some of Goethe's most beautiful conceptions, The Flight into Egypt, The Description of the Pedagogic Province, The Parable of the Three Reverences, is yet an ill-assorted collection of all kinds of writings, old and new. Its author never succeeded in giving it form or coherency, and his later style, beautiful as it is, becomes in these years vague and abstract. Still without this work we should not be acquainted with the full richness and power of his mind.

*Meister's Wanderjahre.*

Second part of *Faust*.

The second part of *Faust* has been a battlefield of controversy since its publication, and demands fuller attention. Its fate may be compared with that of the latest works of Beethoven. For a long time it was regarded as impossible to understand, and as not worth understanding, the production of a great artist whose faculties had been impaired by age. By degrees it has, by careful labor, become intelligible to us, and the conviction is growing that it is the deepest and most important work of the author's life. Its composition cannot be called an afterthought. There is no doubt that the poet finished at the age of eighty the plan which he had conceived sixty years before. The work in its entirety may be described as the first part of *Faust* "writ large." This is a picture of the macrocosm of society as that was of the microcosm of the individual. The parallelism between the two dramas is not perfect, but it reveals itself more and more clearly to a patient study. Some points of this similarity have been well expressed by Rosenkranz (quoted by Bayard Taylor):—"Both parts are symmetrical in their structure. The first moves with deliberate swiftness from heaven through the world to hell; the second returns therefrom through the world to heaven. Between the two lies the emancipation of Faust from the torment of his conscious guilt, lies his Lethe, his assimilation of the past. In regard to substance, the first part begins religiously, becomes metaphysical, and terminates ethically; the second part begins ethically, becomes æsthetic, and terminates religiously. In one, love and knowledge are confronted with each other; in the other, practical activity and art, the ideal of the beautiful. In regard to form, the first part advances from the hymnal shout to monologue and dialogue; the second part from monologue and dialogue to the dithyrambic, closing with the hymn, which here glorifies not alone the Lord and His uncomprehended lofty works, but the human in the process of its union with the divine, through redemption and atonement." The first act, with its varied scenes of country, castle, garden, galleries, and halls, answers to the two prologues of the first part; the second act introduces us again to Faust's study and his familiar Wagner. The classical Walpurgis Night has its prototype in the first part. The third act is devoted to Helena, who is the heroine of the second part as Gretchen is of the first. The marriage of Faust and Helena typifies the union of the classical and romantic schools, and their child is Euphorion, who is symbolical of Byron. In the fourth act Faust is raised instead of being degraded by his union with Helena. He wishes for a sphere of beneficent activity, and obtains it by war. The fifth act is devoted to the complete regeneration of the soul of Faust. Even the sight of all that he has accomplished does not satisfy him. It is not until he is blind to ou' ard objects that one moment of divine rapture reveals to nim the continuance of his work in coming generations, and convinces him that he has not lived in vain. In this one moment of supreme happiness he dies. The struggle for the possession of Faust's soul, indicated in the first part, is fully elaborated in the second. Mephistopheles is shown to have worked out the good in spite of himself, and Margaret appears transfigured as the revelation to man of the divine love.

With the completion of Faust, Goethe felt that the work of his life was accomplished. He still continued to work with regularity. He ordered and arranged his writings, he labored at his *Tages- und Jahreshefte*, an autobiographical journal of his life. He bated not one jot of heart or hope, and took the liveliest interest in every movement of literature and science. When the news of the July Revolution of 1830 reached Weimar, Goethe was excited beyond his wont, not on account of the triumph of liberal principles, but because the controversy between Cuvier and Geoffrey St. Hilaire had been decided in favor of the latter. Still he had much to darken his latter days. His old friends were falling fast around him. His wife had died in 1816, after a union of thirty years. He felt her loss bitterly. The duchess Amalia had died eight years before, not long after the death of his own mother. He now had to undergo bitterer experiences when he was less able to bear them. Frau von Stein, with whom he had renewed his friendship if not his love, died in January, 1827; and in June, 1828, he lost the companion of his youth, the grand-duke Karl August, who died suddenly, away from Weimar, on his return from a journey. Goethe received the news with outward calmness, but said forebodingly, "Now it is all over," and went to mourn and labor at the castle of Dornburg, where everything reminded him of the days of their early friendship. The duchess Louise survived her husband till February, 1830. When Goethe died in 1832 none of the old Weimar set were left except Knebel, who lived two years longer. A greater blow than these was the death of his only son, whom, in spite of his moral weakness, his father deeply loved. He died at Rome in October, 1830, and is buried close by the pyramid of Caius Cestius, where Goethe himself once desired to be laid. We have a full account of the last nine years of Goethe's life from the writings of Eckermann, who became his secretary in 1823, lived with him till his death, and has noted down his conversations and his habits with the minuteness and fidelity of a Boswell.

His death.

We must pass on to the closing scene. On Thursday, March 15, 1832, he spent his last cheerful and happy day. He was visited by the grand-duchess and other friends. He awoke the next morning with a chill. From this he gradually recovered, and on Monday was so much better that he designed to begin his regular work on the next day. But in the middle of the night he woke up with a deathly coldness, which extended from his hands over his body, and which it took many hours to subdue. It then appeared that the lungs were attacked, and that there was no hope of his recovery Goethe did not anticipate death. He sat fully clothed in his arm-chair, made attempts to reach his study, spoke confidently of his recovery, and of the walks he would take in the fine April days. His daughter-in-law Ottilie tended him faithfully. On the morning of the 22d his strength gradually left him. He sat slumbering in his arm-chair holding Ottilie's hand. Her name was constantly on his lips. His mind occasionally wandered, at one time to his beloved Schiller, at another to a fair female head with black curls, some passion of his youth. His last words were an order to his servant to open the second shutter to let in more light. After this he traced with his forefinger letters in the air. At half-past eleven in the day he drew himself, without any sign of pain, into the left corner of his arm-chair, and went so peacefully to sleep that it was long before the watchers knew that his spirit was really gone. He is buried in the grand-ducal vault, where the bones of Schiller are also laid.

Goethe differs from all other great writers, except perhaps Milton, in this respect, that his works cannot be understood without a knowledge of his life, and that his life is in itself a work of art, greater than any work which it created. This renders a long and circumstantial biography a necessity to all who would study the poet seriously At the same time he is so great that we are even now scarcely sufficiently removed from him to be able to form a correct judgment of his place in literary history. He is not only the greatest poet of Germany; he is one of the greatest poets of all ages. Posterity must decide his exact precedence in that small and chosen company which contains the names of Homer, Dante, and Shakespeare. He

was the apostle of self-culture. Always striving after objective truth, and sometimes attaining to it, he exhibited to the world every phase of his plastic mind in turn, and taught both by precept and example the husbandry of the soul. The charge of selfishness so often brought against him cannot be maintained. His nature responded to every influence of passing emotion. Like a delicate harp, it was silent if not touched, and yet gave its music to every wooing of the wilful wind. The charge of unsympathetic coldness roused the deep indignation of those who knew him best. He learned by sad experience that the lesson of life is to renounce. Rather than cavil at his statuesque repose, we should learn to admire the self-conflict and self-command which moulded the exuberance of his impulsive nature into monumental symmetry and proportion. His autobiography has done him wrong. It is the story not of his life, but of his recollections. He needs no defence, nothing but sympathetic study. As Homer concentrated in himself the spirit of antiquity, Dante of the Middle Ages, and Shakespeare of the Renaissance, so Goethe is the representative of the modern spirit, the prophet of mankind under new circumstances and new conditions, the appointed teacher of ages yet unborn.

*Bibliography.*—A complete bibliography of Goethe literature would fill a very large space. We must content ourselves with an indication of the principal sources from which a knowledge of his life may be derived. The most important source of all is his own works. The *Dichtung und Wahrheit*, the *Italienische Reise*, the *Campagne am Rhein*, and the *Tages- und Jahresheften* have an especial autobiographical value. Next to these come the poems, and lastly the letters. Many of these are lost for ever, many remain unpublished. For the first period of his life *Der Junge Goethe*, in three volumes, published by Hirzel, with an introduction by Michael Bernays, is indispensable. It contains his letters and poems in chronological order. A commentary on this work by Wilhelm Scherer, entitled *Aus Goethes Frühzeit* was published in 1879. Otto Jahn published *Goethes Briefe an seiner Leipziger Freunde*. Schöll and A. Hober have collected the letters of the Strasburg period. Goethe's correspondence with Schiller and with Zelter was published during his lifetime. Besides these we have his letters to Herder, Merck, Kestner and Lotte, Lavater, Knebel, Countess Stolberg, Jacobi, Karl August, and Frau von Stein. Lately have appeared his letters to Marianne von Willemer, and some of those addressed to J. G. Schlosser. We are without his letters to Behrisch, Lerse, and Zimmermann; and we have only a few of those addressed to Horn and Sophie la Roche. Goethe's real letters to Bettina von Arnim are in the main unpublished; those which bear the name have been largely falsified, but have a substratum of truth. We have also a few volumes of Goethe's scientific correspondence, published by his descendants. Help to the understanding of his poetry is given by the letters of Wieland, Caroline Flachsland, and his Weimar friends. The letters addressed to him by Frau von Stein exist, but have not been made public. The first life of Goethe was published by Döring in 1828, of which a second enlarged edition appeared after the poet's death in 1833. Then followed Viehoff in 4 volumes, 1847–1853. The best life of Goethe is that of Schäfer, which appeared first in 1851, and the third edition of which dates from 1877. It is contained in two volumes of moderate size, and is written with scarcely a superfluous word. The account of Goethe and Schiller by Karl Goedeke in his *Grundriss der Deutschen Dichtung* is admirable, and so is the little book *Goethes Leben und Schriften*, published by him in 1874. The life of Goethe has been popularized in England by G. H. Lewes, in a work which is as much read in German as in English. A complete biography of Goethe cannot be written until the archives of the Goethe Haus at Weimar are thrown open for consultation. The knowledge of Goethe's works in England is due as much as anything else to the writings of Thomas Carlyle. The commentaries on Goethe's works are endless in number. The most active laborer in this field has been H. Düntze, who has left no side of Goethe's activity and no period of his life unexplored. We must also mention the brilliant lectures on Goethe by Hermann Grimm (Berlin, 1877), and the excellent sketch of his life and works published by W. Hayward in 1878. The following works deserve particular mention:—

*Aus Goethes Knabenzeit* 1757–59, *Mittheilungen aus einem Original manuscript der Frankfurter Stadtbibliothek*, erläutert and herausgegeben von Dr. H. Weismann, Frankfurt, 1846; *Briefe an J. H. Merck von Goethe, Herder, Wieland, und andern bedeutenden Zeitgenossen*, hrsg. von K. Wagner, Darmstadt, 1835; *Briefe aus dem Freundeskreise von Goethe, Herder, Höpfner, und Merck*, hrsg. von Dr. K. Wagner, Leipsic, 1847; *Briefe Goethes an Frau von Stein aus den Jahren*, 1776–1826, hrsg. durch A. Schöll, 3 vols., Weimar, 1848–1851; *Briefe Goethes an die Gräfin Auguste zu Stolberg*, Leipsic, 1839; *Briefe Goethes an Lavater, aus den Jahren 1774–83*, hrsg. von Heinr. Herzel, Leipsic, 1833; *Briefe Goethes an Leipziger, Freunde*, hrsg. von O. Jahn, Leipsic, 1849; *Briefe Goethes in den Jahren 1768–1832*, hrsg. von H. Döring, Leipsic, 1836; *Brief-wechsel d. Grosszherzogs Karl August v. Sachsen-Weimar-Eisenach mit Goethe in dem Jahren von 1775 bis 1828*, 2 vols., Weimar and Leipsic, 1863; *Briefwechsel zwischen Goethe u. F. H. Jacobi*, hrsg. v. Max Jacobi, Leipsic, 1847; *Briefwechsel zwischen Goethe und Zelter in den Jahren 1796–1832*, hrsg. von Fr. W. Reimer, 8 parts, Berlin, 1833–34–36; *Briefwechsel zwischen Goethe u. Marianne von Willemer (Suleika)*, hrsg. mit Lebensnachrichten, etc., von Th. Creizenach, Stuttgart, 1877; H. Döring, *Goethes Leben*, Weimar, 1828, 2d ed., Jena, 1833; and Goedeke, *Goethes Leben u. Schriften*, Stuttgart, 1874, *Goethes Sammlungen*, 3 parts, Jena, Leipsic, 1848, 1849; Dr. Karl Mendelssohn-Bartholdy, *Goethe u. Felix Mendelssohn Bartholdy*, Leipsic, 1871; *Neue Mittheilungen aus Johann Wolfgang von Goethes handschriftlichem Nachlasse*, 8 parts, Leipsic, 1874–76; Dr. J. W. Schäfer, *Goethes Leben*, 2 vols., 8th ed., Leipsic, 1877; H. Viehoff, *Goethes Leben*, 3 parts, Stuttgart, 1847–49; Franz Wegele, *Goethe als Historiker*, 1876; Zellenck, *Die Beziehungen Göthes zu Spinoza*, 1878; Edmund Hoefer, *Goethe und Charlotte von Stein*, Stuttgardt, 1878; *Briefe Goethes an Sophie la Roche und Bettina Brentano*, hrsg. von C. Loeper, Berlin, 1879 (a most valuable little book); Graf Ferdinand von Dürkheim, *Lilis Bild geschichtlich entworfen*, 1879; C. A. H. Burkhardt, *Goethe und der Componist Ph. Chr. Kayser*, Leipsic, 1879; Vinc. Prökl, *Goethe in Eger*, Vienna, 1879. (O. B.)

GOETZ, Hermann (1840–1876), a musical composer, presents one of those instances, too frequent in the history of art, of success long sought for, and cut short by death when achieved at last. He was born at Königsberg in Prussia in 1840, and began his regular musical studies at the comparatively advanced age of seventeen. He entered the music-school of Professor Stern at Berlin, and studied composition chiefly under Ulrich and Hans von Bülow. In 1863 he was appointed organist at Winterthur in Switzerland, where he lived in obscurity for a number of years, occupying himself with composition during his leisure hours. One of his works was an opera, *The Taming of the Shrew*, the libretto skilfully adapted from Shakespeare's play. After much delay it was produced at Mannheim (October, 1874), and its success was as instantaneous as it has up to the present proved lasting. It rapidly made the round of the great German theatres, and spread its composer's fame over all the land. But Goetz did not live to enjoy this happy result for long. In December, 1876, he died at Zurich from overwork. A second opera, *Francesca da Rimini*, on which he was engaged at the time of his death, remained a fragment; but it has since been finished according to his directions by a friend, and was performed for the first time at Mannheim a few months after the composer's death. Besides his dramatic work, Goetz also wrote various compositions for chamber-music, of which a trio (Op. 1) and a quintet (Op. 16) have been given with great success at the London Monday Popular Concerts. Still more important is the *Symphony in F*, on which the composer's great reputation in England is mainly founded. As a composer of comic opera Goetz lacks the sprightliness and artistic *savoir faire* so rarely found amongst Germanic nations. His was essentially a serious nature, and passion and pathos were to him more congenial than humor. The more serious sides of the subject are therefore insisted upon more successfully than Katherine's ravings and Petruchio's eccentricities. There are, however, very graceful passages, *e. g.*, the singing lesson Bianca receives from her disguised lover. Goetz's style, although influenced by Wagner and other masters, shows signs of a distinct individuality. The design of his music is essentially of a polyphonous character, and the working out and interweaving of his themes betray the musician of high scholarship. But breadth and beautiful flow of melody also were his, as is seen in the symphony, and perhaps still more in the quintet for pianoforte and strings above referred to. The most important of Goetz's posthumous works are a setting of the 137th Psalm for soprano solo, chorus, and orchestra, a "Spring" overture (Op. 15), and a pianoforte sonata for four hands (Op. 17).

GOG (גוג) occurs in two passages of Scripture (Ezek. xxxviii.-xxxix. and Rev. xx.) as the name of a great

anti-theocratic power destined to manifest itself in the world immediately before the final dispensation is ushered in. In the later passage, Gog and Magog are spoken of as co-ordinate; in the earlier, Gog is given as the name of the person or people, and Magog as that of the land of its origin. Notwithstanding this discrepancy, it is obvious that the passages are intimately related, and that both depend upon Gen. x. 2, where, however, Magog alone is mentioned. Here he is the second son of Japhet, and, on the assumption that a geographical order underlies these ethnographical tables, his locality is to be sought between Gomer and Madai or Media. According to Josephus, who is followed by Jerome, the Scythians were primarily intended by this designation; and this opinion has been almost universally accepted in modern times. The name Σκίθαι, it is to be observed, however, is often but a vague word for any or all of the numerous and but partially known tribes of the north; and any attempt to assign a more definite locality to Magog can only be very hesitatingly made. According to some, the Maiotes about the Palus Mæotis are meant; according to others the Massagetæ; according to Kiepert, the inhabitants of the northern and eastern parts of Armenia. In Ezekiel, Gog is regarded as a terrible ruler in the extreme north, being prince of Rosh, Mesech, and Tubal, as well as governor in the land of Magog, and having the support of Persia, Ethiopia, and Phut, as well as of Gomer and the house of Togarmah. It may be considered as certain that the imagery employed in this prophetic description was suggested by the Scythian invasion which about the time of Isaiah had devastated Asia (Herod. i. 103 ff.). As might have been expected from the prominence given to that description in the Old Testament, Gog figures largely in Jewish and Mahometan as well as Christian eschatology. In the district of Astrakhan a legend is still to be met with, to the effect that Gog and Magog were two great races, which Alexander the Great subdued and banished to the inmost recesses of the Caucasus, where they are meanwhile kept in by the terror of twelve trumpets blown by the winds, but whence they are destined ultimately to make their escape and destroy the world. The legends that attach themselves to the effigies of Gog and Magog which are at present to be seen in Guild Hall, London, are only remotely connected, if at all, with the statements of Scripture. According to the *Recuyell des Histoires de Troye*, Gog and Magog were the survivors of a race of giants descended from the thirty-three wicked daughters of Diocletian; after their brethren had been slain by Brute and his companions, Gog and Magog were brought to London (Troy-novant), and compelled to officiate as porters at the gate of the royal palace. It is known that effigies similar to the present existed in London as early as the time of Henry V.; but it is uncertain at what date this legend first began to attach to them. According to Geoffrey of Monmouth (*Chronicles* i. 16), Goëmot or Goëmagot (either corrupted from or corrupted into "Gog and Magog") was a giant who, along with his brother Corineus, tyrannized in the western horn of England until slain by foreign invaders.

GOGO, or Ghoghá, a town in Ahmadábád district, Bombay, 193 miles north-west of Bombay. About three-quarters of a mile east of the town is an excellent anchorage, in some measure sheltered by the island of Perim, which lies still further east. The natives of this are reckoned the best sailors in India; and ships touching here may procure water and supplies, or repair damages. It is a safe refuge during the south-west monsoon, or for vessels that have parted from their anchors in the Surat roads, the bottom being an entire bed of mud, three-quarters of a mile from the shore, and the water always smooth. Gogo has of late years lost its commercial importance. Its rival, Bhaunagar, is 8 miles nearer to the cotton districts. North of the town is a black salt marsh, extending to the Bhaunagar creek. On the other sides is undulating cultivated land, sloping to the range of hills 12 miles off. South of the town there is another salt marsh. The land in the neighborhood is inundated at high spring tides, which renders it necessary to bring fresh water from a distance of 4 or 5 miles. The average annual value of the exports for five years ending 1871–72 was £56,227 and of the imports £103,083. Population (1872), 9571.

GOGOL, Nikolai Vasilievich (1809–1852), was born in the province of Poltava, in South Russia, March 31, 1809. Educated at the Niejin gymnasium, he there started a manuscript periodical, "The Star," and wrote several pieces including a tragedy, *The Brigands*. Having completed his course at Niejin, he went in 1829 to St. Petersburg, where he tried the stage but failed. Next year he obtained a clerkship in the department of appanages, but he soon gave it up. In literature, however, he found his true vocation. In 1829 he published anonymously a poem called *Italy*, and, under the pseudonym of V. Alof, an idyll, *Hans Kuchel Garten*, which he had written while still at Niejin. The idyll was so ridiculed by a reviewer that its author bought up all the copies he could secure, and burnt them in a room which he hired for the purpose at an inn. Gogol then fell back upon South Russian popular literature, and especially the tales of Cossackdom on which his boyish fancy had been nursed, his father having occupied the post of "regimental secretary," one of the honorary officials in the Zaporogian Cossack forces. In 1830 he published in a periodical the first of the stories which appeared next year under the title of *Evenings in a Farm near Dikanka: by Rudy Panko*. This work, containing a series of attractive pictures of that Little-Russian life which lends itself to romance more readily than does the monotony of "Great-Russian" existence, immediately obtained a great success,—its light and color, its freshness and originality, being hailed with enthusiasm by the principal writers of the day in Russia. Whereupon Gogol planned, not only a history of Little-Russia, but also one of the Middle Ages, to be completed in eight or nine volumes. This plan he did not carry out, though it led to his being appointed to a professorship in the university of St. Petersburg, a post in which he met with small success, and which he resigned in 1835. Meanwhile he had published his *Arabesques*, a collection of essays and stories; his *Taras Bulba*, the chief of the *Cossack Tales* translated into English by George Tolstoy; and a number of novelettes, which mark his transition from the romantic to the realistic school of fiction, such as the admirable sketch of the tranquil life led in a quiet country house by two kindly specimens of *Old-world Gentlefolks*, or the description of the petty miseries endured by an ill-paid clerk in a Government office, the great object of whose life is to secure the "cloak" from which his story takes its name. To the same period belongs his celebrated comedy, the *Revizor*, or Government Inspector. His aim in writing it was to drag into light "all that was bad in Russia," and to hold it up to contempt. And he succeeded in rendering contemptible and ludicrous the official life of Russia, the corruption universally prevailing throughout the civil service, the alternate arrogance and servility of men in office. The plot of the comedy is very simple. A traveller who arrives with an empty purse at a provincial town is taken for an inspector whose arrival is awaited with fear, and he receives all the attentions and bribes which are meant to propitiate the dreaded investigator of abuses. The play appeared on the stage in the spring of 1836, and achieved a full success, in spite of the opposition attempted by the official classes whose malpractices it exposed. The aim which Gogol had in view when writing the *Revizor* he afterwards fully attained in his great novel, *Mertvuiya Dushi*, or Dead Souls, the first part of which appeared in 1842. The hero of the story is an adventurer who goes about Russia making fictitious purchases of "dead souls," *i. e.*, of serfs who have died since the last census, with the view of pledging his imaginary property to Government. But his adventures are merely an excuse for drawing a series of pictures, of an unfavorable kind, of Russian provincial life, and of introducing on the scene a number of types of Russian society. Of the force and truth with which these delineations are executed the universal consent of Russian critics in their favor may be taken as a measure. From the French version of the story a general idea of its merits may be formed, and some knowledge of its plot and its principal characters may be gathered from the English adaptation published in 1854, as an original work, under the title of *Home Life in Russia*. But no one seems to be able fully to appreciate Gogol's merits as a humorist, who is not intimate with the language in which he wrote as well as with the society which he depicted. In 1836 Gogol for the first time went abroad. Subsequently he spent a considerable amount of time out of Russia, chiefly in Italy, where much of his *Dead Souls* was written. His residence there, especially at Rome, made a deep impression on his mind, which during his later years, turned towards mysticism. The last works which he pub-

lished, his *Confession* and *Correspondence with Friends*, offer a painful contrast to the light, bright, vigorous, realistic, humorous writings which had gained and have retained for him his immense popularity in his native land. Asceticism and mystical exaltation had told upon his nervous system, and his feeble condition showed itself in his literary compositions. In 1848 he made a pilgrimage to Jerusalem, and on his return settled down at Moscow, where he died, March 3, 1852, not having quite completed his forty-third year.

GOITO, a large village of Italy, in the province of Mantua and district of Volta, situated on the right bank of the Mincio, about 14 miles from Castiglione, on the highway between Brescia and Mantua. Its position has made it figure from time to time in the records of Italian warfare. In 1701 it was taken by the allies, in 1706 by the prince of Hesse, and in 1796 by the French. It was the scene of a severe conflict between the French and the Austrians in 1814; and in 1848 it saw the defeat of the Austrians by the Piedmontese. The population of the commune in 1901 was 5.694

GOITRE (from *guttur*, the throat; synonyms, Bronchocele, Derbyshire Neck), a term in medicine applied to a swelling in the front of the neck caused by an enlargement of the thyroid gland. This structure, which lies between the skin and anterior surface of the windpipe, and in health is not large enough to give rise to any external prominence, is liable to occasional variations in size, more especially in females, a temporary enlargement of the gland being not uncommon at the catamenial periods, as well as during pregnancy. In the disease now under consideration, however, the swelling is well marked, and is not only unsightly, but may by its growth occasion much discomfort, and even give rise to serious symptoms from its encroachment on the windpipe and other important parts in the neck. The size to which goitrous growths may attain is extraordinary, Alibert recording cases of goitre where the tumor not only enormously enlarged the neck but hung down over the breast, or even reached as low as the middle of the thigh.

In districts where the disease prevails the goitre usually appears in early life, often from the eighth to the twelfth year. Its growth is at first slow, but after several years of comparative quiescence a somewhat sudden increase is a not unfrequent occurrence. In the earlier stages of the disease the condition of the gland is simply an enlargement of its constituent parts, which retain their normal soft consistence; but in the course of time other changes supervene, and it may become the seat of cystic formations, or acquire hardness from increase of connective tissue or calcareous deposits. Occasionally the enlargement of the gland is uniform, but more commonly one of the lobes, generally the right, is the larger. In some rare instances the disease has been noticed to be limited almost entirely to the isthmus which connects the two lobes of the gland. The growth is unattended with pain, and is not inconsistent with a fair measure of health.

Goitre is a marked example of an endemic disease. There are few parts of the world where it is not found prevailing in certain localities, these being for the most part valleys and elevated plains in mountainous districts. The wide distribution of this disease has naturally led to extensive inquiry and to abundant speculation as to its origin. It is unnecessary to mention the numerous theories which have been advanced on the subject. Many of these have already been referred to under CRETINISM (*q. v.*). The most generally accepted view among physicians is that which ascribes the malady to the use of drinking water impregnated with the salts of lime and magnesia, in which ingredients the water of goitrous districts would appear always to abound. This theory alone, however, is inadequate, as is evident from the often-observed fact that in localities not far removed from those in which goitre prevails, and where the water is of the same chemical composition, the disease may be entirely unknown. Hence among the best authorities the tendency now is to regard goitre as the result of a combination of causes, among which local telluric or malarial influences concur in an important manner with those of the drinking water in developing the disease. It is noteworthy that goitre can often be cured by removal from the district where it prevails, as also that it is apt to be acquired by previously healthy persons who settle in goitrous localities; and it is only in such places that the disease exhibits any hereditary tendencies.

In the treatment of goitre the first step is the removal, if possible, of the patient from the affected locality, and attention to general hygienic rules. The employment of burnt sponge as a cure for goitre was in general use until Dr. Coindet of Geneva showed that its acknowledged virtues were in all probability due to the iodine which it contained, and proposed as a substitute this latter agent in a pure state. Dr. Coindet's views were amply borne out, and iodine and its preparations have been universally adopted as the most potent remedy in this disease, and have superseded all other medicines. Small and gradually increased doses of the drug, either in the form of iodide of potassium or what is known as Lugol's solution appear to be the best methods of administration. The external application of iodine to the goitre, in the form of liniment or ointment, is of scarcely less value than its internal employment, and would seem to be sometimes capable of effecting a cure alone, as is evident from the method of treatment adopted with singular success in India and originally proposed by the late Major Holmes. This consists in applying to the goitre, by means of a spatula, an ointment of biniodide of mercury for about ten minutes soon after sunrise, and placing the patient with his goitre exposed to rays of the sun for six or seven hours. Blistering of the surface generally follows, a second application of the ointment is made, and the patient sent home. This is often found sufficient to effect the cure, but the treatment can, if necessary, be repeated.

The name "Exophthalmic Goitre" is applied to another form of enlargement of the thyroid gland, differing entirely in its pathological connection from that above described. In this affection the bronchocele is but one of three phenomena, which together constitute the typical characteristics of the disease, viz., palpitation of the heart and great vessels, enlargement of the thyroid gland, and protrusion of the eyeballs. This group of symptoms is generally known by the names of Graves's disease or Von Basedow's disease, in reference to the physicians by whom the malady was originally recognized and described. Although occasionally observed in men, this affection occurs much more commonly in females and in comparatively early life. It is generally preceded by ill health in some form, more particularly impoverishment of blood, and nervous or hysterical disorders, and is occasionally seen in cases of organic heart-disease. It has sometimes been suddenly developed as the effect of fright or violent mental emotion. The first of the symptoms to appear is usually the palpitation of the heart, which is aggravated by the slightest exertion, and may be so severe as not only to shake the whole frame but even to be audible at some distance from the patient. An uncomfortable sensation of throbbing is felt throughout the body, and many of the larger blood-vessels are seen to pulsate strongly like the heart. The enlargement of the thyroid gland generally comes on gradually, and rarely increases to any great size, thus differing from true goitre, as originally noticed by Dr. Graves. The enlarged gland is of soft consistence, and communicates a thrill to touch from its dilated and pulsating blood-vessels.

Accompanying the goitre a remarkable change is observed in the appearance of the eyes, which attract attention by their prominence and the startled expression thus given to the countenance. In extreme cases the eyes protrude from their sockets to such a degree that the eyelids cannot be closed, and injury may thus arise to the constantly exposed eyeballs. Apart from such risk, however, the vision is rarely affected in this disease. Much difference of opinion prevails as to the immediate cause of the protrusion of the eyes, but it is generally ascribed to the increase of the fatty tissue and distension of the blood-vessels of the orbits. It occasionally happens that in undoubted cases of the disease one or other of the three above-named phenomena is absent, generally either the goitre or the exophthalmos. The palpitation of the heart is the most constant symptom. Sleeplessness, irritability, disorders of digestion, diarrhœa, and uterine derangements are common accompaniments.

The pathology of exophthalmic goitre is still somewhat uncertain, but there are strong reasons to believe that it is essentially a nervous ailment, and that the symptoms depend on a morbid state of the sympathetic nerve in the neck, which is well known to play an important part in the vaso-motor functions—that is, in controlling the action of the heart and regulating the calibre of the blood-vessels. In numerous instances of exophthalmic goitre a diseased

state of this nerve has been found *post mortem*, although it must be admitted that in some cases no morbid change could be detected. The experiments of Bernard, Brown-Sequard, Schiff, and others upon the functions of the sympathetic nerve lend strong support to this view of the pathology of the disease. Exophthalmic goitre is not directly a fatal malady, but, on the other hand, complete recovery is a less frequent result than partial improvement, the patient continuing to suffer from chronic ill-health. The disturbed condition of the heart's action leads in some instances to permanent disease of that organ in the form of dilatation of its cavities. In the treatment of exophthalmic goitre the most successful results have been attained by the use of digitalis, which has the effect of giving tone to the heart and contracting the dilated blood-vessels. The tincture of digitalis, in doses of 5 to 10 drops twice or thrice daily, is perhaps the best form of administration. Where anæmia is present iron is indicated, and may be combined with the digitalis, although in some cases it is found to be unsuitable. In allaying the palpitation benefit is said to have frequently followed the application of ice to the cardiac region as well as to the thyroid gland. Iodine, which is so valuable in cases of true goitre, is generally admitted to be of no service in this disease, and is rather held to be injurious. (J. O. A.)

GOLCONDA, a fortress and ruined city, situated in the Nizám's Dominions, 7 miles west of Hyderabad city. In former times Golconda was a large and powerful kingdom of the Deccan, which arose on the downfall of the Báhmani dynasty, but was subdued by Aurungzebe in 1687, and annexed to the dominions of the Delhi empire. The fortress of Golconda, situated on a rocky ridge of granite, is extensive, and contains many enclosures. It is strong and in good repair, but is commanded by the summits of the enormous and massive mausolea of the ancient kings about 600 yards distant. These buildings, which are now the chief characteristics of the place, form a vast group, situated in an arid, rocky desert. They have suffered considerably from the ravages of time, but more from the hand of man, and nothing but the great solidity of their walls has preserved them from utter ruin. These tombs were erected at a great expense, some of them being said to have cost as much as £150,000. Golconda fort is now used as the nizám's treasury, and also as the state prison. The diamonds of Golconda have obtained great celebrity throughout the world; but they were merely cut and polished here, being generally found at Partial, near the south-eastern frontier of the nizám's territory.

GOLD, the color, lustre, and power of resisting oxidation, which this metal possesses, have caused it to be valued from the earliest ages. Allusions to gold are frequent in the Old Testament, and the refining of the precious metals by cupellation seems to have been a favorite illustration with the Jewish poets.[1] Jewellery and vessels found in Egyptian tombs afford evidence of the perfection attained in working gold at a period earlier than the government of Joseph,[2] and drawings on tombs of about this epoch clearly indicate the method of conducting the operations of washing, fusing, and weighing the metal. Excavations in Etruria have brought to light beautiful ornaments of gold, enriched with minute grains of the metal, the workmanship of which was unrivalled until Castellani studied and revived the methods employed by Etruscan artists.[3] The Greeks were familiar with natural alloys of silver and gold named *electrum*, rough nuggets of which were frequently stamped, and formed the earliest coins in Lydia.[4] The color of this electrum is pale yellow to yellowish white, and it contains from 20 to 40 per cent. of silver.

With regard to the history of the metallurgy of gold, it may be mentioned that, according to Pliny, mercury was employed in his time both as a means of separating the precious metals and for the purposes of gilding. Vitruvius also gives a detailed account of the means of recovering gold, by amalgamation, from cloth into which it had been woven.

*Properties.*—Gold is the only metal of a yellow *color*, which is, however, notably affected by small quantities of other metals, thus the tint is sensibly lowered by small quantities of silver, and heightened by copper. The surface color of particles of gold is often apparently reddened by translucent films of brown iron ore. It is nearly as soft as lead. The *hardness* varies, however, with the composition. Crystallized specimens from Oregon and Fraser River, containing respectively 835 and 910 parts of gold in 1000, are slightly harder than calc spar but sensibly softer than fluor spar, or much harder than the pure metal. When pure, gold is the most *malleable* of all metals. One grain may be beaten into leaves which cover a surface of 56 square inches, and are only $\frac{1}{282000}$th of an inch thick. Faraday has shown that the thickness of gold leaves may be still further reduced by floating them on a dilute solution of cyanide of potassium. When very thin, leaf gold appears yellow by reflected and green by transmitted light. If, however, certain gold films are heated, the light transmitted is ruby red; the pressure of a hard substance on the film so changes its state of aggregation that green light is again transmitted.[5] The metal is extremely *ductile;* a single grain may be drawn into a wire 500 feet in length, and an ounce of gold covering a silver wire is capable of being extended more than 1300 miles. Gold can readily be welded cold, and thus the finely divided metal, in the state in which it is precipitated from solution, may be compressed between dies into discs or medals. According to G. Rose,[6] the *specific gravity* of gold in the finely divided state in which it is precipitated from solution by oxalic acid is 19·49. The specific gravity of cast gold varies from 18·29 to 19·37, and by compression[7] between dies the specific gravity may be raised from 19·37 to 19·41; by annealing, however, the previous density is to some extent recovered, as it then is found to be 19·40. Its *atomic weight* is variously given as follows:—196·67 (Berzelius), 196·3 (Levol), 196.5 (Wurtz), 196·0 (Watts). The number adopted in this work (CHEMISTRY, vol. v., p. 458) is 196·2. Different observers have given the following temperatures as its *melting point:* —1425° C. (Daniell), 1200° C. (Pouillet), 1380° C. (Guyton de Morveau). Riemsdijk,[8] after comparing the several results, concludes that it may be considered to be 1240° C. The *electric conductivity* is given by Matthiessen as 73·99 at 15·1° C., pure silver being 100; this depends greatly on its degree of purity,—the presence of a few thousandths of silver lowering its conductivity by 10 per cent. The *specific resistance* of the metal in electro-magnetic measure, according to the centimetre-gramme-second system of units, is 2154. Its *conductivity for heat* is 53·2 (Wiedemann and Franz), pure silver being 100. Its *specific heat* is 0·324 (Regnault). Its *coefficient of expansion* for each degree between 0° and 100° C. is 0·000014661, or for gold which has been annealed 0·000015136 (Laplace and Lavoisier). The *speeific magnetism* of the metal is 3·47 (Becquerel). Details as to its *tenacity* and *rigidity* are given in the article ELASTICITY. With regard to its *volatility*, Gasto Claveus[9] states that he placed an ounce of pure gold in an earthen vessel in that part of a glass-house where the glass is kept constantly melted, and retained it in a state of fusion for two months without the loss of the smallest portion of its weight. Kunkel describes a similar experiment, which was attended with the same result. Homberg,[10] however, observed that when a small portion of gold is kept at a violent heat, part of it is volatilized. Both Macquer and Lavoisier showed that when gold is strongly heated, fumes arise which gild a piece of silver held in them. Its volatility has also been studied by Elsher, and, in the presence of other metals by Napier.[11] Hellot affirms that when an alloy of 7 parts of zinc and 1 part of gold is heated in air, the whole of the gold rises in the fumes of oxide of zinc which are produced. Gold is dissipated by sending a powerful charge of electricity through it when in the form of leaf or thin wire. In the gold *spectrum* Huggins has observed twenty-three lines, and the wave lengths of the three most important of these are 5231, 5835, and 6276 respectively. Some preliminary observations on the spectrum of the vapor at the temperature of the oxyhydrogen flame, made by Lockyer and Roberts,[12] showed that there was a distinct absorption both at the blue and at the red end.

The solvents for gold are given in the article CHEMISTRY, vol. v., p. 458. It may be added that finely-divided gold dissolves when heated with strong sulphuric acid and a little nitric acid. Dilution with water, however, precipitates the metal as a violet or brown powder from the solution so obtained. Gold is also attacked when strong sulphuric acid is submitted to electrolysis with a gold positive pole.[1] W. Skey has shown[2] that in substances which contain small quantities of gold, the precious metal may be removed by the solvent action of a tincture of iodine or bromine in water. Filter paper soaked with the clear solution is burnt, and the presence of gold is indicated by the color of the ash.

*Occlusion of Gas by Gold.*—Graham has shown[3] that gold is capable of occluding 0·48 of its volume of hydrogen, and 0·20 of its volume of nitrogen. Varrentrapp has also pointed out that "cornets" from the assay of gold may retain gas if they are not strongly heated. Artificial crystals of gold may be formed when the molten metal is slowly cooled.

*Occurrence and Distribution.*—Gold is found in nature chiefly in the metallic state, or as native gold, and less frequently in combination with tellurium, lead, and silver, forming a peculiar group of minerals confined to a few localities in Europe and America. These are the only certain examples of natural combinations of the metal,—the minute although economically valuable quantity often found in pyrites and other sulphides being probably only present in mechanical suspension, although for practical purposes it may be spoken of as combined. The native metal occurs tolerably frequently in crystals belonging to the cubic system, the octahedron being the commonest form, but other and complex combinations have been observed. Owing to the softness of the metal, large crystals are rarely well defined, the points being commonly rounded. In the irregular crystalline aggregates branching and moss-like forms are most common, and in Transylvania thin plates or sheets with diagonal structures are characteristic. These have recently been shown by Vom Rath to be repeated combinations of distorted tetrahexahedra. During the preparation of a mass of pure gold in the Mint at London, some fine crystals which appear to be aggregations of octahedra were obtained; and dendritic crystals of gold, prepared artificially, have been described by Chester. It is possible also to obtain gold in crystals by heating its amalgam; according to Knafll, an amalgam of 1 part of gold with 20 parts of mercury is maintained at a temperature of 80° C. for eight days. It is then heated to 80° C. with nitric acid of specific gravity 1·35, when dull crystals will be left, which become brilliant when more strongly heated. More characteristic, however, than the crystallized are the irregular forms, which, when large, are known as "nuggets" or "pepites," and when in pieces below ¼ to ½ ounce weight as gold dust, the larger sizes being distinguished as coarse or nuggety gold, and the smaller as gold dust proper. Except the larger nuggets, which may be more or less angular, or at times even masses of crystals, with or without associated quartz or other rock, gold is generally found bean-shaped or in some other flattened form, the smallest particles being scales of scarcely appreciable thickness, which, from their small bulk as compared with their surface, subside very slowly when suspended in water, and are therefore readily carried away by a rapid current. These form the "float gold" of the miner. The physical properties of native gold are generally similar to that of the melted metal and its alloys as described above. The composition varies considerably in different localities, as shown in the preceding table.

Of the minerals containing gold the most important are sylvanite or graphic tellurium, of composition $(AgAu)Te_2$, with 24 to 26 per cent.; calaverite, $AuTe_2$, with 42 per cent.; and nagyagite or foliate tellurium, of a complex and rather indefinite composition, with 5 to 9 per cent. of gold. These are confined to a few localities, the oldest and best known being those of Nagyag and Ofenbanya in Transylvania; but latterly they have been found in some quantity at Red Cloud, Colorado, and in Calaveras county, California,—the nearly pure telluride of gold, calaverite, being confined to these places.

The minerals of the second class, usually spoken of as auriferous, or containing gold in sensible quantity, though not to a sufficient amount to form an essential in the chemical formulæ, or even in many instances to be found in the quantities ordinarily operated upon in analyses, are comparatively numerous, including many of the metallic sulphides. Prominent among these are galena and iron pyrites,—the former, according to the observations of Percy and Smith, being almost invariably gold-bearing to an extent that can be recognized in operating upon a pound weight of the lead smelted from it, the proportion increasing to some extent with the amount of silver.[4] The second is of greater practical importance, being in some districts exceedingly rich, and, next to the native metal, is the most prolific source of gold. Magnetic pyrites, copper pyrites, zinc blende, and arsenical pyrites are other and less important examples,—the last constituting the gold ore formerly worked in Silesia. A native gold amalgam is found as a rarity in California, and bismuth from South America is sometimes rich in gold. Native arsenic and antimony are also very frequently found to contain gold and silver.

The association and distribution of gold may be considered under two different heads, namely, as it occurs in mineral veins, and in alluvial or other superficial deposits which are derived from the waste of the former. As regards the first, it is chiefly found in quartz veins or reefs traversing slaty or crystalline rocks, usually talcose or chloritic schists, either alone or in association with iron, copper, magnetic and arsenical pyrites, galena, specular iron ore, and silver ores, and more rarely with sulphide of molybdenum, tungstate of calcium, bismuth, and tellurium minerals. Another more exceptional association, that with bismuth in calcite from Queensland, was described by the late Mr. Daintree. In Hungary, the Urals, and northern Peru, silicates and carbonates of manganese are not uncommonly found in the gold and silver bearing veins. In the second or alluvial class of deposits the associated minerals are chiefly those of great density and hardness, such as platinum, osmiridum, and other metals of the platinum group, tinstone, chromic, magnetic, and brown iron ores, diamond, ruby, and sapphire, zircon, topaz, garnet, etc., which represent the more durable original constituents of the rocks whose disintegration has furnished the detritus. Native lead and zinc have also been reported among such minerals, but their authenticity is somewhat doubtful.

The distribution of gold-bearing deposits is world-wide, although the relative importance of different localities is very different, their geological range is also very extensive. In Europe the principal groups of veins are in slaty or crystalline schists, whose age, when it can be determined, is usually Palæozoic, Silurian, Devonian, or Carboniferous, and less commonly in volcanic formations of Tertiary age. The alluvial deposits, being more extensive, are less intimately connected with any particular series of rocks. Few of either are, however, of much importance as compared with the more productive deposits of America and Australia. In the United Kingdom gold-bearing quartz veins

[4] *Phil. Mag.*, vii., 1854, p. 126.

were worked during the Roman occupation at Ogofau, near Llanpumpsant, in Carmarthenshire; and in the year 1863 as much as 5300 oz. was produced from similar veins in Lower Silurian slates at Vigra and Clogau mines, near Dolgelly. In 1875 the mine was reopened, and in 1878 it produced 720 oz. Tetradymite, native bismuth, and several other characteristic associates of gold were also found in small quantity. In Cornwall small pieces of native gold have at intervals been found in alluvial or stream tin works; and similar but more important finds have been made in the granite district of Wicklow, and more recently at Helmsdale, in Sutherlandshire. The largest nugget of British origin weighs under 3 oz.

On the continent of Europe the great rivers originating in the crystalline rocks of the Alpine region, such as the Rhine and Danube, are slightly auriferous in their alluvial deposits in several places; but the proportion of gold is extraordinarily minute, so that the working is only carried on by gipsies, or by the local peasantry at irregular intervals, the return for the labor expended being very small. The same remark applies to the Rhone and its affluents, and the rivers of the central granitic mass of France. In the Austrian Alps the gold quartz mines at the Rathausberg, near Gastein, at a height of about 9000 feet above the sea-level, and at Zell, in Tyrol, are of interest historically as having developed the system of amalgamation in mills, although they are economically of small importance at present. On the Italian side, in the Valanzasca and Val Toppa above Lago Maggiore, a group known as the Pestarena mines have yielded from 2000 to 3000 ounces annually for several years past; and more recently a discovery of great interest of a highly auriferous copper ore has been made at Ollomont in the Val d'Aosta. In Hungary the gold-bearing veins of Schemnitz occur in greenstones and trachytes of Tertiary age, the most powerful example, the *Spitaler-gang*, being filled with a mixture of quartz and brown iron ore known as zinnopal, and containing gold associated with silver ores, galena, and pyrites. In Transylvania, at Nagyag, the gold-bearing tellurium minerals previously noticed are found in small veins traversing greenstone trachyte. These are often very thin, as low as $\frac{1}{8}$th to $\frac{1}{16}$th of an inch, but each is carefully traced out, the rock being impregnated with gold and silver to a certain depth on each side. At Vörospatak, another Transylvanian locality, gold with a very large proportion of silver and associated with gypsum is worked in veins traversing a Tertiary sandstone, being almost the only known instance of such a mode of occurrence.
